

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# SALE OF GOVERNMENT PUBLICATIONS.

The modern system of Time has been appointed sole Agent for the sale of Government Publications, including Parliamentary Reports and Papers, Acts of Parliament, General Office Publications, &c., &c., and all such works can be purchased from them either directly or through retail bookshops, who are entitled to a discount of 25 per cent. from the selling prices.

## IN ENGLAND

For all publications excepting Ordnance and Geographical Maps, the Hydrographical Works of the Admiralty and Patent Office Publications: Messrs. TIME & SOUTHWICK, 15, Abchurch Lane, E.C. 4.

For Hydrographical Works of the Admiralty: Mr. J. D. POTTER, 115, Mark Lane, E.C.

Patent Office Publications are sold at the Patent Office.

For all publications excepting the Hydrographical Works of the Admiralty, Patent Office Publications, and Ordnance and Geographical Maps.

IN SCOTLAND: Messrs. OLIVER AND BOYD, Edinburgh.

IN IRELAND: Mr. E. POWSONBY, 110, Grafton Street, Dublin.

The Publications of the Ordnance SURVEY, and of the Geographical SURVEY, can be purchased from Agents appointed at the principal towns in the United Kingdom, or of any Bookseller, or from the Director General of the Ordnance Survey, Southampton, or the Director General of the Geographical Office, Southampton, or the Director General of the Ordnance Survey, Dublin. Ordnance and Geographical Survey Publications can be obtained through Head Post Offices in towns where there are no accredited Agents.

The following is a list of some of the more important Parliamentary and Official Publications recently issued:—

## Parliamentary

### Statutes

*Table General, passed in 1899, 1900, 1901, and 1902. With Index, Tables, &c. Roy. 8vo. Cloth. Price 3s.*

ROYAL WARRANT DATED THE 21st DAY OF JUNE, 1900.

**VICTORIA R.,**

**Victoria**, by the Grace of God, of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

**To** Our right trusty and right well-beloved cousin, Wilbraham, Earl Egerton; Our right trusty and well-beloved John, Baron Revelstoke; Our trusty and well-beloved Alfred Lyttelton, Esquire (commonly called the Honourable Alfred Lyttelton), one of Our Counsel learned in the Law; Our trusty and well-beloved Sir Robert Giffen, Knight Commander of our Most Honourable Order of the Bath, Doctor of Laws; Our trusty and well-beloved Sir John Wolfe Wolfe-Barry, Knight Commander of Our Most Honourable Order of the Bath, Doctor of Laws, Fellow of the Royal Society; Our trusty and well-beloved Sir John Hext, Knight Commander of Our Most Eminent Order of the Indian Empire, Rear-Admiral on the Retired List of Our Navy; and Our trusty and well-beloved John Edward Ellis, Esquire; Greeting!

**Whereas** We have deemed it expedient that a Commission should forthwith issue to inquire into the present administration of the Port of London and the water approaches thereto; the adequacy of the accommodation provided for vessels, and the loading and unloading thereof; the system of charge for such accommodation and the arrangements for warehousing dutiable goods; and to report whether any change or improvement in regard to any of the above matters is necessary for the promotion of the trade of the port and the public interest:

**Now know ye**, that We, reposing great trust and confidence in your knowledge and ability, have nominated, constituted, and appointed, and do by these Presents nominate, constitute, and appoint, you, the said Wilbraham, Earl Egerton; John, Baron Revelstoke; Alfred Lyttelton; Sir Robert Giffen; Sir John Wolfe Wolfe-Barry; Sir John Hext; and John Edward Ellis, to be Our Commissioners for the purposes of the said inquiry.

**And** for the better effecting the purposes of this Our Commission, We do by these Presents give and grant unto you, or any three or more of you, full power to call before you such persons as you shall judge likely to afford you any information upon the subject of this Our Commission; and also to call for, have access to, and examine all such books, documents, registers, and records as may afford you the fullest information on the subject; and to inquire of and concerning the premises by all other lawful ways and means whatsoever.

**And** We do by these Presents authorise and empower you, or any three or more of you, to visit and personally inspect such places as you may deem it expedient so to inspect for the more effectual carrying out of the purposes aforesaid, and to employ such persons as you may think fit to assist you in conducting any inquiry which you may hold.

**And** We do by these Presents will and ordain that this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any three or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

**And** we do further ordain that you or any three or more of you, have liberty to report your proceedings under this Our Commission from time to time if you shall judge it expedient so to do.

**And** Our further will and pleasure is that you do, with as little delay as possible, report to Us under your hands and seals, or under the hands and seals of any three or more of you, your opinion upon the matters herein submitted for your consideration.

Given at Our Court at Windsor, the twenty-first day of June, One thousand nine hundred, in the sixty-fourth year of Our Reign.

By Her Majesty's Command,

M. W. RIDLEY.

ROYAL WARRANT DATED THE 4<sup>TH</sup> DAY OF MARCH, 1901.

---

**EDWARD R.**

**Edward the Seventh**, by the Grace of God, of the United Kingdom of Great Britain and Ireland King, Defender of the Faith, to all to whom these presents shall come, Greeting!

**Whereas** it pleased Her late Majesty from time to time to issue Royal Commissions of Inquiry for various purposes therein specified:

**And** whereas in the case of certain of these Commissions, namely, those known as—

The Historical Manuscripts Commission ;  
 The Horse Breeding Commission ;  
 The Local Taxation Commission ;  
 The Port of London Commission ;  
 The Salmon Fisheries Commission ; and  
 The Sewage Disposal Commission ;

the Commissioners appointed by Her late Majesty, or such of them as were then acting as Commissioners, were, at the late demise of the Crown, still engaged upon the business entrusted to them :

**And** whereas We deem it expedient that the said Commissioners should continue their labours in connection with the said inquiries notwithstanding the late demise of the Crown :

**Now** know ye that We, reposing great trust and confidence in the zeal, discretion, and ability of the present members of each of the said Commissions, do by these Presents authorize them to continue their labours, and do hereby in every essential particular ratify and confirm the terms of the said several Commissions.

**And** We do further ordain that the said Commissioners do report to Us under their hands and seals, or under the hands and seals of such of their number as may be specified in the said Commissions respectively, their opinion upon the matters presented for their consideration ; and that any proceedings which they or any of them may have taken under and in pursuance of the said Commissions since the late demise of the Crown, and before the issue of these Presents shall be deemed and adjudged to have been taken under and in virtue of this Our Commission.

Given at Our Court at Saint James's, the fourth day of March, one thousand nine hundred and one, in the first year of Our Reign.

By His Majesty's Command,  
 CHAS. T. RITCHIE.

---

ROYAL WARRANT DATED THE 6TH DAY OF MARCH, 1901.

---

**EDWARD R.,**

**Edward the Seventh**, by the Grace of God, of the United Kingdom of Great Britain and Ireland, King, Defender of the Faith.

**To** Our right trusty and well-beloved John, Baron Revelstoke ; Our trusty and well-beloved William Robert Wellesley Peel, Esquire (commonly called the Honourable William Robert Wellesley Peel) ; Our trusty and well-beloved Alfred Lyttelton, Esquire (commonly called the Honourable Alfred Lyttelton), one of Our Counsel learned in the Law ; Our trusty and well-beloved Sir Robert Giffen, Knight Commander of our Most Honourable Order of the Bath, Doctor of Laws ; Our trusty and well-beloved Sir John Wolfe Wolfe-Barry, Knight Commander of Our Most Honourable Order of the Bath, Doctor of Laws, Fellow of the Royal Society ; Our trusty and well-beloved Sir John Hext, Knight Commander of Our Most Eminent Order of the Indian Empire, Rear-Admiral on the Retired List of Our Navy ; and Our trusty and well-beloved John Edward Ellis, Esquire ; Greeting !

**Whereas** it pleased Her late Majesty by Warrant bearing date the twenty-first day of June One thousand nine hundred to authorise and appoint certain noblemen and gentlemen therein named, or any three or more of them, to be Commissioners to inquire into the present administration of the Port of London and the water approaches thereto ; the adequacy of the accommodation provided for vessels, and the loading and unloading thereof, the system of charge for such accommodation and the arrangements for warehousing dutiable goods ; and to report whether any change or improvement in regard to any of the above matters is necessary for the promotion of the trade of the port and the public interest :

**Now know ye**, that We have revoked and determined, and ~~do~~ by these Presents revoke and determine, the said Warrant and every matter and thing therein contained.

**And** whereas We have deemed it expedient that a new Commission should issue for the purposes specified in the said Warrant, dated the twenty-first day of June One thousand nine hundred.

**Further know ye**, that We, reposing great trust and confidence in your ability and discretion, have appointed, and do by these Presents nominate, constitute, and appoint you, the said John, Baron Revelstoke ; William Robert Wellesley Peel ; Alfred Lyttelton ; Sir Robert Giffen ; Sir John Wolfe Wolfe-Barry ; Sir John Hext ; and John Edward Ellis, to be Our Commissioners for the purposes aforesaid.

**And** for the better effecting the purposes of this Our Commission, We do by these Presents give and grant unto you, or any three or more of you, full power to call before you such persons as you shall judge likely to afford you any information upon the subject of this Our Commission ; and also to call for, have access to, and examine all such books, documents, registers, and records as may afford you the fullest information on the subject ; and to inquire of and concerning the premises by all other lawful ways and means whatsoever.

**And** We do by these Presents authorise and empower you, or any three or more of you, to visit and personally inspect such places as you may deem it expedient so to inspect for the more effectual carrying out of the purposes aforesaid, and to employ such persons as you may think fit to assist you in conducting any inquiry which you may hold.

**And** We do by these Presents will and ordain that this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any three or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

And We do further ordain that you, or any three or more of you, have liberty to report your proceedings under this Our Commission from time to time if you shall judge it expedient so to do.

And Our further will and pleasure is that you do, with as little delay as possible, report to Us under your hands and seals, or under the hands and seals of any three or more of you, your opinion upon the matters herein submitted for your consideration.

Given at Our Court at Saint James's the sixth day of March, One thousand nine hundred and one, in the first year of Our Reign.

By His Majesty's Command,  
CHAS. T. RITCHIE.

---

:

TO THE KING'S MOST EXCELLENT MAJESTY.

---

MAY IT PLEASE YOUR MAJESTY,

We, the undersigned Commissioners appointed to inquire into the administration of the Port of London and other matters connected therewith, desire humbly to present to your Majesty the following Report :—

It may be remembered that a previous Royal Commission, consisting of most of our number, had been appointed by Her late Most Gracious Majesty, Queen Victoria, on the 21st of June 1900, and under the chairmanship of Earl Egerton of Tatton, had made some progress with the inquiry. Unfortunately, Earl Egerton was compelled, through ill-health, to resign his appointment early in 1901. Under Your Majesty's Warrant of the 6th March 1901, the former Warrant was revoked and a new Commission was issued to the same persons, Lord Revelstoke succeeding Earl Egerton in the Chairmanship and the Hon. W. R. W. Peel, M.P., being appointed as an additional Royal Commissioner.

The terms of the reference made to us are as follows :—

“To inquire into the present administration of the Port of London and the water approaches thereto; the adequacy of the accommodation provided for vessels, and the loading and unloading thereof; the system of charge for such accommodation, and the arrangements for warehousing dutiable goods; and to report whether any change or improvement in regard to any of the above matters is necessary for the promotion of the trade of the port and the public interest.”

PROCEDURE.

Our first meeting was held on the 28th day of June, 1900, and we then thought it to be desirable that we should ourselves visit the River Thames and the docks, and inspect the accommodation available for trade in the Port of London.

We accordingly visited the lower part of the river and the several docks belonging to the London and India, Millwall, and Surrey Commercial Dock Companies. Subsequently we inspected the up-town warehouses of the London and India Dock Company and the principal private wharves of the Port.

We further made visits to Manchester and Liverpool for the purpose of viewing the docks at Liverpool and the property of the Manchester Ship Canal Company, and informing ourselves of the arrangements made by the Mersey Docks and Harbour Board for dealing with shipping in that river. Some of our number have also visited other ports in the United Kingdom, as well as some foreign ports on the shores of the North Sea and the Channel, which compete more or less with London.

We also submitted to the authorities at Belfast, Bristol, Dublin, Glasgow, Greenock, Hull, Liverpool, Manchester, and Newcastle-upon-Tyne, a series of questions on details germane to our inquiry, the answers to which are contained in our volume of Appendices. With the assistance of Your Majesty's Consuls we obtained similar information with regard to the ports of Antwerp, Bremen-Bremerhaven, Dunkirk, Hamburg, Havre and Rotterdam.

We next made arrangements for the reception of oral evidence and we decided that our meetings for this purpose should be open to the press and the public. We invited evidence from all bodies concerned in the administration of the Port of London. With regard to the course of the evidence, we determined that we should in the first place hear solely those witnesses who were in a position to speak as to the existing condition

of the docks and the arrangements for dealing with goods at present prevailing in the Port, and that not until this evidence was concluded would we consider any definite proposals of reform.

The following bodies were, by our permission, represented at the inquiry by Counsel, viz.:—

The London and India Docks Company.  
 The Millwall Dock Company.  
 The Surrey Commercial Dock Company.  
 The City Corporation.  
 The London County Council.  
 The London Chamber of Commerce.  
 The Thames Conservancy.  
 The Wharfingers' and Warehousekeepers' Association.  
 The Association of Master Lightermen and Bargeowners.  
 The Watermen and Lightermen's Company.  
 The Promoters of the Thames Lightermen's Bill, 1901.  
 The Short Sea Traders' Association.  
 The Commissioners of Sewers of Kent and Essex, and  
 The North London Railway Company.

In order that the conduct of the inquiry should be retained entirely in our hands, we announced that we should only accept the assistance of Counsel as and when we deemed it necessary. We further laid down the following rules for the guidance of Counsel:—

That all witnesses, except as hereinafter mentioned, will be called and examined by the Commission.

That if the evidence of any witness shall affect the interest of any persons or body represented by Counsel, application may be made to the Commission for leave to cross-examine such witness.

That if it be desired to call any witness not examined by the Commission, Counsel must apply for permission to call such witness, who will be examined as the Commission may think fit.

Among other witnesses we heard those representing the Thames Conservancy, the Board of Customs, the Corporation of Trinity House, the Pilots, the General Shipowners' Society, Short Sea Traders' Association, the Dock Companies, the Wharfingers' and Warehousekeepers' Association, the Association of Master Lightermen and Bargeowners, the Watermen's Company, the London County Council, the City Corporation, and the London Chamber of Commerce.

We also perused several Reports by Select Committees of the House of Commons, and by Departmental Committees, relating to questions which affect the Port of London. Among the more modern of these we may mention the Report of the Select Committee on Pilotage, 1870, of the Thames Traffic Committee appointed by the Board of Trade, which reported in 1879, of the Select Committee on Pilotage of 1888, and of the Lower Thames Navigation Commission appointed under the Thames Conservancy Act, 1894.

We received oral evidence with regard to the administration of the ports of Liverpool, Bristol, Glasgow and Newcastle-upon-Tyne, and Southampton.

Schemes for the future administration of the Port of London were laid before us by the London County Council, the City Corporation, and the London Chamber of Commerce.

The number of days on which we sat for the reception of evidence was thirty-one, during which we examined 114 witnesses. We also collected a great mass of documents bearing upon the subject, which are printed in our volume of Appendices.

We desire to express our sense of the courtesy shown and trouble taken by the officials of the various public authorities and dock companies, and other witnesses, in preparing and presenting evidence, and in answering written inquiries. In particular, we wish to express our high appreciation of the conspicuous care and ability which characterised the evidence of Mr. C. J. Cater Scott, the Chairman of the London and India Docks Company. We also received valuable assistance from the Counsel who appeared before us.

We have received useful assistance from Mr. C. E. D. Black, who has acted as Assistant Commissioner during the whole of our proceedings.

Mr. Cecil Owen, our original Secretary, was compelled by ill-health to resign his post in November 1901, but not before he had devoted much labour to organising the evidence and arranging the documents submitted to the Commission.

He was succeeded by Mr. Bernard Holland, who, though not present at the hearing of the voluminous evidence, mastered and assimilated it with great industry. We desire to place on record our recognition of the signal ability with which he assisted us in the preparation and completion of the Report.

We propose in the first place to state the case before us as briefly as its complexity permits, and then to submit our recommendations as to the steps which we think that it will be advisable to take for the benefit of the Port of London.

## HEADS OF STATEMENT OF THE CASE

---

### PART I.

	PARAGRAPH
1. Character of the Thames Estuary - - - - -	1
2. Volume and character of the trade of the Port of London - -	12

### PART II.

#### CONTROLLING AUTHORITIES OF THE RIVER THAMES.

1. The Thames Conservancy, including questions connected with the deepening and improvement of the river channels - - -	41
2. The Trinity House, including questions connected with pilotage, buoying and lighting - - - - -	81
3. The Watermen's Company, including questions connected with the licensing of lightermen and watermen - - - - -	110
4. The Sanitary Authority of the Port - - - - -	122
5. The Police Authority of the Port - - - - -	125

### PART III.

#### THE DOCK COMPANIES, INCLUDING QUESTIONS CONNECTED WITH THE USE OF THE DOCKS.

1. History and description of the docks now controlled by the London and India Dock Company - - - - -	126
2. Financial position of this Company - - - - -	142
3. Surrey Commercial Docks - - - - -	148
4. Millwall Docks - - - - -	154
5. Other Docks - - - - -	158
6. Necessary expenditure upon the docks, and reasons of difficulties in providing adequate funds - - - - -	161
7. Proposals made by the London and India Dock Company, and objections - - - - -	190
8. Complaints of ship-owners with regard to the Docks - - -	200
9. Complaints of consignees - - - - -	203
10. Complaints as to Dock Dues on goods - - - - -	211
11. General Observations - - - - -	215

### PART IV.

1. Constitution and expenditure of governing bodies in other British Ports - - - - -	216
2. Administration and public expenditure in certain foreign ports -	226
3. Proposals made to the Commission with regard to the reform of the Port of London - - - - -	233

### PART V.

Custom House Arrangements - - - - -	246
-------------------------------------	-----

---

PART I.

---

1.—CHARACTER OF THE THAMES ESTUARY.

2.—VOLUME AND CHARACTER OF THE TRADE OF  
LONDON.

---

## CHARACTER OF THE THAMES ESTUARY.

1. The fact that London is a port traversed by a long and sheltered tidal river, and conveniently situated for trading with the various coasts of this country, with the Continent, and with other parts of the world, has, no doubt, largely contributed to its rise to the position of the greatest city in England, and so to that of the central city of the British Empire. The Thames is not, like some rivers of greater length and volume, subject to excessive floods, nor is it, like the Elbe and others, often blocked or troubled with ice. There is not, as in many ports, any well marked bar across the mouth of the river, and the natural scour is almost sufficient to maintain the depth of channels. Some of the channels, it is true, of the outer estuary, that is, of the river below Shoeburyness and the Nore, vary from time to time in position and depth from the operation of gales upon sandbanks and other natural causes,<sup>1</sup> but it was pointed out to us by a witness of authority that "so great are the natural advantages of the river that little has been done, except some desultory dredging, to improve its condition, since those almost prehistoric times when it was originally embanked." The evidence leaves no doubt in our minds that far greater works than desultory dredging are now needed, but this is due only in a slight degree, if at all, to any positive deterioration in the river channels. The new necessities are due in the main to the revolution brought about by the rapid growth in the size and draught of ocean-going ships and to the demand for rapid dispatch.

Binnie 3045.

2. Our attention was called to the possible effects of the abstraction of upland water which is taken above Teddington for the supply of London, and it was stated by Sir Alexander Binnie, then Chief Engineer to the London County Council, that the effect of this abstraction, if its increase be permitted, may be detrimental to the Port.

Binnie 3155.

3. The seaward limit of the Port of London, in its most extended sense, is defined in the Thames Conservancy Act of 1894 (2nd Schedule) to be a line passing from a point near the tower on Harwich Naze in Essex to a point about five miles from the North Foreland Lighthouse in Kent.<sup>2</sup> A chart in sections of the river and estuary showing the latest figures of depths, is annexed to our Report.

4. The average rise of spring and neap tides in the Thames above low water of spring tides may be taken as follows :—

	Springs.	Neaps.
At the Nore - - - - -	17 11	13 1
At Gravesend - - - - -	19 9	15 7
At the Royal Albert Docks - - - - -	22 0	17 6
At the new entrance of the Surrey Commercial Docks -	22 0	17 4
At London Bridge - - - - -	21 8	16 11
At Vauxhall - - - - -	17 5	14 10
At Richmond - - - - -	12 7	8 3

<sup>1</sup> Davies, 4241; 4297; Penney, 4136-44; 4213-25; Rigden, 4312.

<sup>2</sup> The Act 13 and 14 Charles II., c. ii., defined the legal and Customs Port of London as extending from London Bridge to North Foreland, Kent, and the Naze, Essex. The actual Customs Port, however, as fixed by Order in Council under the Customs Acts, now begins at a line drawn from Havengore Creek in Essex to Warden Point in the Isle of Sheppey.

5. A full description of the Estuary of the Thames below the Nore and of the River from the Nore to Gravesend is given in the Report of the Lower Thames Navigation Commission,<sup>1</sup> and it is, therefore, unnecessary for us to deal with this part of the subject further than to say that seaward of the Nore there have always existed channels of sufficient width and depth for the safe navigation, at all times of tide, of vessels of the largest class. There have been from time to time changes in the position and direction of these channels, but history shows that whenever one channel has deteriorated some other channel has correspondingly improved.

The chief obstruction to navigation between the Nore and Gravesend is at the Leigh Middle Shoals, which extend from near Shoeburyness to Canvey Point, a distance of nearly seven miles.<sup>2</sup> The condition and mode of improvement of these Shoals were fully discussed in the report of the Lower Thames Navigation Commission. No doubt was expressed by the engineers called before us that the channels through these shoals could be improved in the mode suggested by the Commission of 1896, by the erection of a training wall, and by the execution of whatever dredging might be necessary after the effect of the training wall in directing the tidal currents had been seen.

From Canvey Point to Gravesend an inconsiderable amount of dredging would be sufficient to provide a channel of 30 feet at low water of spring tides.

6. Above Gravesend the present condition of the River, as deduced from the large scale contour map, soundings and chart, handed in at our request by Mr. C. J. More, the engineer of the Thames Conservancy, may be shortly described as follows :—

Witnesses who appeared before us when quoting the depths of the channels usually gave the maximum depths of the channel without regard to its bottom width, which in many cases is inconsiderable compared with admitted requirements. It is obvious that from the depths so stated a large reduction should be made in considering the available navigable depth for large ships. A more accurate mode of describing the present condition of the Thames for navigable purposes is to adopt the widths of channel proposed by Mr. More, the Engineer of the Thames Conservancy, for future adoption, and to give the present minimum depth within the sideway boundaries of the bottom of the channel in question.

7. Considering then the present navigable channel above Gravesend from this point of view, the following description may be instructive, the depths stated being in all cases below the plane of low water of ordinary spring tides :—

Starting from the Ship and Lobster Inn, in Gravesend Reach, a depth of 30 feet exists as far up the river as Broadness Point, at the western end of Northfleet Hope.

Off Broadness Point considerable shoaling takes place, and the limitation of depth is 20 feet, though the greatest depth of the channel is from 30 to 40 feet. From Greenhithe to Crayfordness, throughout the length of Long Reach, the limitation of depth is about 24 feet. After passing Crayfordness the channel becomes very patchy and ill-defined, so that between Crayfordness and Jenningtree Point the depth should be taken as about 18 feet. On entering Half-Way Reach, there is a still further deterioration and the limitation of depth would be about 17 feet up to Crossness Point. From Crossness to Margaretness the channel though deeper is much contracted in width, and adopting the same method of description the depth must be taken as 14 feet. On entering Gallions Reach an improvement takes place, and the depth may be taken as 16 feet at the Royal Albert Dock entrance and as far as Woolwich. From Woolwich Dock Yard to the new entrance of the Surrey Commercial Docks the limitation must be taken, in a channel with a width of 400 feet, as about 12 feet

<sup>1</sup> See Appendix, A, page 126, *post*.

<sup>2</sup> The buoyed channel through these shoals, having a depth of 25 feet of water at low water of spring tides is about three nautical miles in length, and the position and depth of this channel is variable.

and from the Surrey Commercial Dock to Limehouse Dock as about 10 feet. From Limehouse Dock to St. Katharine's Dock the depth is from 12 to 16 feet deep in a channel of a width of 300 feet.

It is no doubt the fact that ships are navigated up and down the Thames, requiring, after allowing for the rise of tide, greater depths of water than we have adopted in our review of the present condition of the Thames. Such ships are in consequence confined in their course to channels of less width than recommended by Mr. More, with resulting danger and delay, and it is more instructive, in view of the real requirements of safe navigation, to adopt the widths of channel recommended by the Engineer of the Thames Conservancy as necessary rather than to state the greatest depths to be found in a narrow and in places tortuous channel. The widths recommended do not appear to us excessive, in view of the extremely heavy traffic of the Thames.

It is to be remembered that in considering the draught of water of a ship which could use the channels, allowance must be made for at least two feet of water under the keel in the case of large vessels and somewhat less for small vessels.

8. With regard to the river's course, the curvature is, in some cases, sharp for an important navigation like that of the Thames, conducted under the conditions of tidal currents of considerable strength. Below Gravesend Reach the sharpest curve is about  $1\frac{1}{4}$  miles. Above Tilbury there are curves of one mile and  $\frac{3}{4}$ -mile between Tilbury and Fiddler's Reach. Above Fiddler's Reach there is a sharp curve of half a mile radius, and round Crayfordness and Cold Harbour Point there is a reverse curve of  $\frac{3}{4}$ -mile radius, which curvature also exists in various places as far up as Barking Reach. Between Barking Reach and Galleons Reach is Margaretness, and the channel, in passing round this point, has a radius of considerably less than  $\frac{1}{2}$ -mile. From Galleons Reach up to the entrance of the Victoria Dock for a distance of four miles, the channel is easier and the curves flatter, being not less than  $\frac{3}{4}$ -mile radius. Immediately above the Victoria Dock occurs the well-known Black-wall Point, where the radius of the channel is about  $\frac{1}{4}$ -mile, and from thence St. Katharine's Dock to a distance of about  $6\frac{1}{2}$  miles, the River assumes the form of the letter S, the curves varying in radii from  $\frac{4}{5}$  to  $\frac{2}{3}$  mile.

9. Considering the tidal currents of the Thames and the size of the ships navigating the River, the curves above mentioned are undesirably sharp, but, owing to the skill and experience of those concerned in the navigation, no serious difficulties are usually experienced from the curves, even with the present depths, though serious collisions no doubt from time to time occur. The vast number of barges and small craft add very greatly to the natural difficulties of the river's course, and in any improvement in the channels to be hereafter taken in hand, the question of improving some of the above-mentioned curves, and of widening the channel beyond the average width to be adopted through curved portions, should be borne in mind.

10. The subjoined table embraces the length of river between the Nore and London Bridge, which amounts to  $47\frac{1}{2}$  statute miles, and the distances between the various places which are mentioned in the following description are as follows:—

	Statute Miles.
From the Nore Lightship to the lower end of Leigh	
Middle Shoals is - - - - -	$\frac{1}{2}$
Lower end of Leigh Middle Shoals to Canvey Point is	$6\frac{1}{2}$
Canvey Point to Mucking Light is - - - - -	7
Mucking Light to Shorne Meade Battery is - - - - -	$4\frac{1}{2}$
Shorne Meade Battery to Gravesend is - - - - -	3
From the Nore Lightship to Gravesend is therefore -	$21\frac{1}{2}$
Gravesend to Broadness Point is - - - - -	$2\frac{3}{4}$
Broadness to Greenhithe is - - - - -	$1\frac{3}{4}$
Greenhithe to Crayfordness is - - - - -	$3\frac{1}{2}$

	Statute Miles
Crayfordness to the upper end of Erith Reach is -	3
Erith Reach to Crossness is - - - - -	2
Crossness to Margaretness is - - - - -	1 $\frac{3}{4}$
Margaretness to the entrance to the Royal Albert Dock is - - - - -	$\frac{1}{2}$
<hr/>	
From Gravesend to the Royal Albert Dock is therefore - - - - -	15 $\frac{1}{4}$
The Royal Albert Dock to Woolwich Dockyard is -	1 $\frac{1}{2}$
Woolwich Dockyard to Blackwall is - - - - -	2 $\frac{1}{2}$
Blackwall to the new entrance to Surrey Commercial Docks is - - - - -	3 $\frac{1}{4}$
Surrey Commercial Docks to the Shadwell entrance of the London Docks is - - - - -	1 $\frac{1}{2}$
Shadwell entrance of the London Docks to the Thames Tunnel is - - - - -	$\frac{1}{2}$
Thames Tunnel to London Bridge is - - - - -	1 $\frac{1}{2}$
<hr/>	
From the Royal Albert Docks to London Bridge is therefore - - - - -	10 $\frac{3}{4}$
<hr/>	
And the total distance from the Nore Lightship to London Bridge is therefore - - - - -	47 $\frac{1}{2}$

11. We shall describe more at length in the latter part of our Report the various docks which open into the river. It is enough to say here that the Tilbury Docks, belonging to the London and India Dock Company, have their entrance on the north side of Gravesend Reach, almost opposite to the town of Gravesend, at a distance by water of about twenty-six miles from London Bridge. The entrance to the Royal Albert Docks is on the north side of the Galleons Reach about ten-and-three-quarter miles from London Bridge. The East and West India Docks, also on the north side, open to the river at Blackwall between the fifth and sixth mile, and the Millwall Docks on the Limehouse Reach rather more than three miles from the Bridge. Opposite to the Millwall Docks on the south side of the river are the lower entrances to the Surrey Commercial Docks, and their upper entrances are from the "Lower Pool," about a mile higher up. The Shadwell entrance of the London Docks is on the north side, about 2 miles below London Bridge, and the entrance to the St. Katharine's Docks is immediately below the Tower Bridge.

## VOLUME AND CHARACTER OF THE TRADE OF THE PORT OF LONDON.

12. The Port of London is still, as it has been for at least two hundred years, the greatest in the world in respect of the amount of shipping and of goods which enter it. Statistics show a constant growth in the volume of the trade, although the rate of increase has not been so rapid in the more recent years as it was in some former times.

13. Inasmuch as, by reason of changes in money values, the official values of goods entering a Port at different dates do not afford an accurate basis of comparison of the volume of trade, the better test of the rise or decline of the commerce of a port, even allowing for changes in the modes of calculating the carrying capacity of ships, is that supplied by the variations in the tonnage of the shipping entering it or clearing from it with cargo. It must, however, be remembered that for various reasons even this indication may be far from perfect. The following figures give comparisons for four consecutive decennial periods. It will be observed that the total absolute increase has been large, but that the percentage of increase, after being very high from 1859 to 1879, has diminished in the two last periods,

**TOTAL NET TONNAGE OF SHIPPING ENTERED AND CLEARED WITH CARGO  
(FOREIGN TRADE ONLY) AT THE PORT OF LONDON. (1)**

1869	-	-	-	-	-	-	6,102,686
1859	-	-	-	-	-	-	4,372,367
Increase upon 1859							1,730,319 or 39 per cent.
1879	-	-	-	-	-	-	8,781,669
1869	-	-	-	-	-	-	6,102,686
Increase upon 1869							2,678,983 or 43 per cent.
1889	-	-	-	-	-	-	12,071,671
1879	-	-	-	-	-	-	8,781,669
Increase upon 1879							3,290,002 or 37 per cent.
1899	-	-	-	-	-	-	15,286,643
1889	-	-	-	-	-	-	12,071,671
Increase upon 1889							3,214,972 or 26 per cent.

<sup>1</sup> These figures are compiled from figures taken from the "Annual Statements of Trade and Navigation." See App. 234-43.

14. The same result of a continuous, but not continuously rapid, increase in the tonnage using the Port of London is shown by a table furnished to us by the Clerk of the London County Council, relating to the whole tonnage of the Port, and compiled, it was stated, from Board of Trade official figures :—

Increase - - - - -									

<sup>1</sup> Cardiff and Newcastle, notwithstanding the greatness of their trade, have not been included among these ports, because their trade is of a very special kind.

<sup>2</sup> The increase in the case of London would have been sensibly larger, but for the omission of coasting vessels for places within the estuary of the Thames, which was made after 1897.

<sup>3</sup> The creation of Manchester as a separate port in 1894 must be noted.

## SHIPPING ENTERED—continued.

1890 - - - - -	1,471,464	
Increase - - - - -	710,282 or 48 per cent.	

The figures given above include all shipping whether in foreign or coasting trade, and (with the exceptions noted) whether entering with cargo or in ballast.

17. The following figures, taken from a Return supplied by the Board of Trade, are those of ships entering the above-mentioned British ports in foreign trade only and with cargoes :—

London, 1899 - - - - -	9,244,593	App. p. 843.
1890 - - - - -	7,532,174	
Increase - - - - -	1,712,419 or 22 per cent.	
Liverpool, 1899 - - - - -	6,050,712	App. p. 843.
1890 - - - - -	5,656,392	
Increase - - - - -	394,320 or 6 per cent.	
Glasgow, 1899 - - - - -	1,355,331	App. p. 848.
1890 - - - - -	1,052,317	
Increase - - - - -	303,014 or nearly 29 per cent.	
Hull, 1899 - - - - -	2,258,400	App. p. 845.
1890 - - - - -	1,932,317	
Increase - - - - -	326,083 or nearly 17 per cent.	
Southampton, 1899 - - - - -	1,556,575	App. p. 846.
1890 - - - - -	884,595	
Increase - - - - -	671,980 or 75 per cent.	
Bristol, 1899 - - - - -	756,811	App. p. 844.
1890 - - - - -	555,826	
Increase - - - - -	200,985 or 36 per cent.	

\* Exclusive of coasting vessels entering in ballast, the information for 1890 not being available. The tonnage of such vessels in 1899 was as follows :—

Havre - - - - -	49,225
Marseilles - - - - -	95,815

18. The obvious indication of these figures is that in recent years the percentage of increase has been much greater at a port like Southampton and at certain Continental ports such as Hamburg, Rotterdam and Antwerp, than it has been at older ports, such as London, Liverpool and Hull in this country, or at Havre, Marseilles, and Genoa on the Continent, all of which were more conspicuous at an early date than the ports which have lately been developing so rapidly. The explanation would appear to be that to some extent the ports in question are calling ports, especially ports like Southampton, Rotterdam and Antwerp, and that their business as a whole does not properly enter into comparison with that of a port which is chiefly one of ultimate destination like London and Liverpool. We are unable to conclude, therefore, that the figures show any relative decline of London compared with the other ports named, allowing for the difference in the nature of the business done. This view is further strengthened when we allow for such obvious explanations as the larger percentage of the increase in a case when the initial figure is small than in a case when it is large, although the amount of increase is the same in both, and for the fact that a large part of the trade of Hamburg, Rotterdam and Antwerp is with the ports of the United Kingdom, and even with London. What the future development will be it is not easy to foresee. Southampton, Hamburg, Rotterdam and Antwerp have all gained largely in the shipping returns in recent years by the establishment of lines of steamers, many of these with subsidies, just as London and older ports gained at an earlier date, but there is nothing to indicate that the older ports are being superseded, or prevented from largely increasing. The development of Hamburg, in particular, it should be added, cannot be unconnected with the increasing dependence of Germany, as its population increases on supplies of food and raw material imported from abroad, and especially from oversea, Hamburg being the chief inlet of the whole Empire.

19. The following figures show, upon the basis of values of goods, the growth of the import trade into the Port of London since the year 1872, relatively to the import trade of the rest of the United Kingdom. It must be borne in mind that the period 1872-1899 was on the whole one of falling prices, so that the actual increase in the amount of goods imported has been much in excess of that denoted by money values :—

App. p. 276.

Year.	Value of Imports into the		London's proportion per cent. of the United Kingdom.
	Port of London.	Rest of the United Kingdom.	
	£	£	
1872 - - - - -	124,174,141	230,519,483	35·0
1882 - - - - -	142,507,974	270,511,634	34·5
1892 - - - - -	144,273,415	279,520,467	34·1
1899 - - - - -	164,105,695	320,929,888	33·8

20. Both the figures of shipping tonnage and those of values of goods show that the imports of the Port of London exceed the exports. This has been in modern times true of the United Kingdom as a whole, and it is especially true of London, which is itself a centre of consumption rather than of production. The above returns show that in the year 1899 the value of foreign and colonial merchandise imported into the Port of London was 33·8 per cent. of the whole imports into the United Kingdom. In the same year the total exports from London were valued at £88,178,000, and those from the rest of the United Kingdom at £241,356,000. London's proportion was 26·7 per cent. of the United Kingdom. The volume of exports from London is probably increased by the fact that London is so large an importing centre, and that the outgoing ships consequently draw trade from other parts of the country.

21. If the exports of home produce alone are taken London's proportion is still lower. These exports from London were in 1899 valued at £53,717,000 out of a total for the United Kingdom of £264,492,000, or 20·3 per cent. of the whole. The re-exports from London of foreign and colonial produce were valued at £34,461,000 out of a total of £65,042,000 for the United Kingdom, or 53 per cent. of the whole. App., p. 278.

It thus appears that the proportion of all imports to exports is higher in the Port of London than it is in the whole of the United Kingdom, and that a considerable, though decreasing, proportion of the whole export trade of London consists in the transshipment of foreign and colonial produce.

22. In character, the import trade may be distinguished into three classes:—

- (1) The "destination" trade, or the import of goods for consumption or use in London and its immediate district.
- (2) The inland and coastwise trade, or the import of goods to be conveyed by railway, canal, or coasters to other parts of the United Kingdom.
- (3) The foreign transshipment trade, consisting in the import of goods destined for immediate or eventual transport to the Continent of Europe, or to other parts of the world.

Figures to distinguish the first two classes cannot be given, but there is no doubt that the bulk of the imports entering the Port are consumed or used by the vast population immediately surrounding it, and that the growth of the trade of the Port in recent years is chiefly due to the increase in the numbers and wealth of the inhabitants of London and its environs. Gomme, 3225.

23. The existence upon the Thames of the greatest market and centre of consumption in the world has, it is contended, bestowed upon the port a huge practical monopoly. London was sure of a trade of which rivals could not deprive it, and, in consequence, had not the usual incentives to effect improvements. Other ports in keen competition with each other for the general world-trade have improved their organisation and physical advantages in recent years, while London has, in these respects, remained much more nearly stationary. Hence, it is suggested, both the inland and re-export trade of London may have lost ground, relatively to other Ports, in consequence of the improvements in other maritime cities of the United Kingdom and in adjacent countries. So far as relates to the re-export of foreign and colonial produce the figures seem, to some extent, to correspond with this view. Owen, 5163.

24. The total value of foreign and colonial produce exported from the United Kingdom in 1882, was £65,193,000, of which the share of the Port of London was £39,884,000, or 61·2 per cent. The total value of such produce exported in 1899 was £65,042,000, of which the share of the Port of London was £34,461,000, or 53 per cent. App., p. 277.  
App., p. 278.

Allowance must be made for a general fall in money values during this period, but on the figures it appears that for the whole United Kingdom no advance in this re-export trade has been made during the period 1882 to 1899, and that such change as there has been consists in a loss in this kind of trade by London and the gain of an equivalent amount by other ports in the United Kingdom. Ryder, 676.

It is necessary to exercise great caution in drawing conclusions as to the rise or decline of trade over a period from official money values. In the case of dutiable goods, such as wines and spirits, tea and tobacco, we have figures showing the actual quantities of goods imported for transshipment and exported after transshipment, and not included in the above figures of re-exports. The variations are so sudden and numerous that no definite conclusions can be drawn. So, for instance, about 16 million pounds of tea were exported from London after transshipment in 1888, about 7 millions in 1893, over 11 millions in 1897, 8 millions in 1898 and 13½ millions in 1899. App. 279-284.  
App., p. 282.

25. On the whole, however, statistics show that if the London entrepôt or re-export trade to foreign countries has not absolutely declined during

the last twenty years, yet it certainly has not advanced in proportion to the general development of the trade and shipping of the United Kingdom. Witnesses who appeared before us were for the most part filled with gloomy anticipations as to the future of this branch of commerce, which has had so important a part in the history of London. Some witnesses attribute this decline, or, at least, failure to progress, chiefly to the shortcomings of the Port. One witness who took this view was Mr. J. Rogers, who represented the London Chamber of Commerce.

Referring to certain goods which used to come to London for re-export but are now sent direct to Hamburg or Antwerp, he said :

8685.

"I am fully aware that there are other causes for this, but one main cause is the heavy nature of the dock charges in London, . . . .  
"insufficient depth of water in the river, and other general causes, which  
"are rapidly destroying the character of this port as an entrepôt for colonial  
"and foreign trade."

26. Other witnesses attributed the fact in question to causes of a wider character. So Mr. McEwan, a large tea dealer, speaking of a decline in the transshipment of tea in London, said :

8661.

"I do not attribute the falling-off in that class of trade to anything  
"whatever connected with the Port of London, but to the ordinary  
"commercial development of other nations and of the British Colonies.  
"New trade routes have been opened up, and particularly the increase  
"in the number of steamships, induced by the opening of the Suez Canal,  
"has given facilities for direct transit that renders London no longer  
"necessary as the general tea entrepôt of the world. Then, again, the  
"existence of six or eight trans-Continental lines of railway in North  
"America, all more or less in competition with each other as to rates,  
"has caused the United States and Canada to obtain a large portion  
"of their tea supplies through their western seaboard, via San Francisco,  
"Seattle, Tacoma, and Vancouver, leaving Great Britain to supply, instead  
"of all as formerly, only a small proportion of the requirements. Russia  
"and Germany in particular, although the latter is only a small consumer  
"of tea, have established lines of steamers sailing direct from tea ports  
"to Odessa, Hamburg, and elsewhere, and in addition to the Trans-  
"Pacific lines of steamers there are now regular sailings from the  
"principal tea ports of the East, via the Suez Canal, to New York."

5161.

27. We may quote also from the evidence given by Mr. D. Owen, a gentleman who has made a long and careful study of the conditions affecting the Port of London. He said :—

"Formerly London was a distributing and collecting port, as being the  
"world's trade focus, the world's market. The cargoes came to the  
"biggest market. The Low Countries and the Continent bought in  
"London and sent goods to London for shipment. London was the  
"‘Goods Exchange’ for Europe to a large extent. Foreign produce  
"formerly was largely a prohibitive luxury only available to the few.  
"Foreign ports had no use for shiploads; they wanted parcels; shiploads  
"came to London. The development of production, cheapening of  
"transport, abolition of duties, increase of population, spread of wealth,  
"and the introduction of steam factories, altered the situation. The  
"Continent became able to swallow whole shiploads, but Continental  
"ports being undeveloped and unhandy, and the force of ancient usage  
"being very strong, cargoes continued to come to London. In 1863 the  
"abolition of the Scheldt dues threw open Antwerp, which at once began  
"to compete with London. The Suez Canal was opened, trade increased  
"enormously, and ships began to be ordered, with full cargoes, to Antwerp.  
"The new departure extended to Hamburg, Rotterdam, Havre, and other  
"places, and all these ports began competing furiously with one another,  
"and all with London. Moreover, the practically new ports of Marseilles,  
"Genoa, and Trieste now intercept cargo which formerly passed through  
"the Straits of Dover, and these ports are greatly developing. This  
"competition, powerful as it is, is still in its infancy. Continental ports are  
"spending lavishly on improvements, and already British shipowners prefer

"Antwerp to London, and would as soon go even to Hamburg as to London. It seems inevitable that the business of London as a port of distribution will decline.

28. Sir Thomas Sutherland, the Chairman of the Peninsular and Oriental Company, said that a great deal of wool which formerly came from Australia to London for re-export now goes direct to the Continent, and that the same thing was true of many other commodities. He gave as one instance the silk trade, "which before the days of the Messageries Maritimes centred in London and has all been now transferred to the Continent." This change, he says, had begun before the opening of the Suez Canal, but had been increased by the creation of that new thoroughfare. 1962.  
1964.

29. The English carrying trade grew up protected by the Navigation Laws against the competition of the old maritime nations, like the Dutch, and secured a practical monopoly, as against other European countries, during the long wars at the end of the 18th and the beginning of the 19th centuries. Hence it was placed in, and long maintained, a position of almost unnatural superiority. It was to be expected that other European nations should in time develop their own mercantile marine, by means of subsidies and otherwise, and secure for their shipping part of their own import and export trade. No doubt also the growth of direct trade, so far as regards the South of Europe, has been accelerated by the substitution of the Mediterranean for the Cape route to the East.

30. Against causes of this general character improvements in the Port of London would not have much effect. Our attention was however called to the fact that if the Port becomes less convenient, or more expensive, for the reception of large ships than neighbouring rival ports, such as Hamburg, Rotterdam and Antwerp, then London is not only in danger of losing anything which remains of the re-export trade to Germany, Holland and Belgium, but also that part of the general re-export trade may pass to those ports. So for instance, Mr. Owen said:

"Considerable cargo comes to London from Australia and the East to be put on board steamers for America. This trade will come to England in the cheapest, that is to say in the biggest ships. If London cannot take those ships, the trade will go to Liverpool or Antwerp, and the transshipment will be made there. I have no doubt that large transshipments from the East and Australia to America are in fact now made from Hamburg and Antwerp instead of through London." 5160.

31. It is also possible and indeed highly probable that large ships, if time and money could be saved by doing so, would discharge at Rotterdam and Antwerp goods intended for England and Scotland which would then be conveyed to their destinations by Channel and North Sea steamers. If the facilities of the Port of London for ocean-going ships became less than those of Hamburg, Rotterdam or Antwerp, goods, for instance, from Australia or India destined for Yorkshire or Scotland might be transhipped at these foreign ports for Hull or Leith, with the result that the profits of the operation would be transferred from London to the Continent. So also goods destined for the London market itself might easily be transhipped at Rotterdam or Antwerp, instead of at Tilbury or the Albert Dock, loaded into small Channel steamers and run straight up to wharves on the Thames. The operation might cost little more than the use of lighters from the Tilbury or Albert Dock to the wharves, and the profit gained by the entrance of the ocean ships, and the handling of the cargoes would be transferred from London to its continental rivals.<sup>1</sup> These considerations point to the advantage of adapting the Thames in every way to the requirements of modern ocean-going ships. Owen, 5157.

32. Our attention was called by many witnesses to the rapid changes in the construction and size of ships which have taken place during the last

---

Interesting evidence bearing upon these points was given by Sir William Ward, British Consul-General at Hamburg, to the Select Committee of the House of Commons on steamship subsidies. C. 300 of 1901.

fifty years. One great change is that from a predominance of sailing ships to one of steamships, another the increase in the average tonnage of ships.<sup>1</sup>

The last mentioned change is due to the construction in recent years of ships of dimensions far in excess of those previously used. It is a change which has revolutionized all the conditions of maritime competition and has the most material bearing upon the subject of our inquiry.

33. The following Return of the Board of Trade shows the progress which has taken place :—

TABLE showing the NUMBER and TONNAGE of VESSELS, REGISTERED under MERCHANT SHIPPING ACTS, belonging to the UNITED KINGDOM on 31st December of each of the undermentioned Years, and NUMBER and TONNAGE of such VESSELS belonging to LONDON and LIVERPOOL, respectively, on the same dates.

## (c) STEAM VESSELS.

Number of Steam Vessels.			
1840	768	† (220)	52
1850	1,178	333	93
1860	1,988	527	223
1870	3,168	690	456
1880	5,235	1,037	667
1890	7,381	1,451	967
1899	8,997	1,651	1,025
1900	9,178	1,653	1,073
1901	9,452	1,728	1,100
Tonnage of Steam Vessels.			
1840	87,539	† (37,257)	5,769
1850	167,212	67,916	11,411
1860	452,352	189,199	67 85
1870	1,111,375	294,156	280,807
1880	2,720,551	579,625	555,062
1890	5,037,666	1,071,853	1,006,713
1899	6,912,417	1,404,321	1,531,033
1900	7,202,509	1,468,709	1,713,506
1901	7,612,507	1,594,939	1,802,401

*Note.*—Fishing boats registered only under the Sea Fisheries Act, 1868, or Part IV. of the Merchant Shipping Act, 1894, are not included in the above Table. The sections of the Sea Fisheries Act, 1868, under which fishing boats were registered, were repealed by and re-enacted in the Merchant Shipping Act, 1894.

It will be observed (1) that the relative places held by sailing ships and steam vessels have been inverted during this period; (2) that while the total tonnage in the United Kingdom has been more than trebled, the total number of ships had become actually less in 1899 than it was in 1840.

34. The following tables supplied to us by the Thames Conservancy bear upon the same point. They refer to all vessels subject to Conservancy dues, both entering and clearing from the Port of London from the year 1894 to 1900, and the percentage of each class of tonnage. It will be seen that in the case of steamships, the percentage of ships under 3,000 tons net register has decreased during this period, and that of ships over 3,000 tons has more than doubled.

35. Taking steam vessels separately, for a longer period, the returns supplied by the Board of Trade show that during the last thirty years the rate of increase of ships of 3,000 tons and upwards belonging to the United Kingdom and in active service has been much more rapid than that of ships below 3,000 tons. These returns also show that the collective tonnage of steamships has increased in a very much greater proportion than has their number. The tonnage is net registered tonnage.

TABLE showing the NUMBER and TONNAGE of STEAM VESSELS, registered under the App. p. 842, MERCHANT SHIPPING ACTS, belonging to the UNITED KINGDOM, classified according to their Tonnage, *that were Employed some time during the Year* in each of the undermentioned Years.

(Vessels employed on Rivers and in Inland Navigation are not included.)

*Note.*—Fishing boats registered only under the Sea Fisheries Act, 1868, or Part IV. of the Merchant Shipping Act, 1894, are not included in the above Table. The sections of the Sea Fisheries Act, 1868, under which fishing boats were registered, were repealed by and re-enacted in the Merchant Shipping Act, 1894.

36. We desire to call special attention to the following table showing the increase in the size of ships of all nationalities, compiled for us by the Secretary of Lloyd's Register of British and Foreign Shipping. The tonnage taken in this case is not the net tonnage as in the Board of Trade Returns, but gross tonnage as in popular use.

NUMBER OF STEAMSHIPS OF ALL NATIONALITIES (EXCLUDING WARSHIPS) OF 2,000 TONS GROSS AND OVER AFLOAT AT VARIOUS DATES.

Tonnage.	1886.	1896.	1899.	1901.
2,000 to 2,999 - - -	943	2,010	2,120	2,177
3,000 to 3,999 - - -	317	804	1,090	1,311
4,000 to 4,999 - - -	110	323	414	560
5,000 and above - - -	40	214	395	578
Total over 2,000 -	1,410	3,351	4,019	4,626

There were afloat at the close of the year 1901 the following steamships (excluding warships) from and over 5,000 tons gross, belonging to the following countries :—

Nationality.	Number of Steamships from 5,000 tons gross to 6,999 tons gross.	Number of Steamships from 7,000 tons gross to 9,999 tons gross.	Number of Steamships over 10,000 gross tonnage.
British - - - - -	255	80	28
American (United States) -	31*	1	6
Dutch - - - - -	4	1	4
French - - - - -	18	5	2
German - - - - -	81	18	24
Russian - - - - -	11	2	nil.

\* Including 15 trading on the Great Lakes of North America.

It will be observed that in the largest class of modern vessel, ships over 10,000 tons, German competition is very close. It seems to be possible also that the United States are about to attempt to increase their mercantile marine by a subsidising policy. These are among the signs which show how seriously the maritime superiority of this country is now being challenged. It is clear that any incapacity of the greatest British port, which takes about a fifth of the trade of the United Kingdom, and does so much transshipment and re-export trade, to accommodate the largest modern steamers, may count in deciding the result of the contest.

37. The two largest ships now afloat are the "Celtic," of the White Star Line, which has a gross tonnage of 20,880, a length of 680 feet, breadth of 75 feet, and depth of 45 feet, and the "Oceanic," of the same line, which has a gross tonnage of 17,274, a length of 685·7 feet, breadth of 68·3 feet, and depth of 44·5 feet.<sup>1</sup> These dimensions give some idea of the possible class of ship for whose reception the channels and docks of any port which desires to remain in the first rank must in future be adapted.

38. The ship owners who gave evidence before us dwelt much upon the increase in draught of modern steamers. Sir Edwyn Dawes, a director of the

<sup>1</sup> Lloyd's Register, 1901-2. It is understood that the steamer "Kaiser Wilhelm II.," which is now in course of construction at Stettin, has a gross tonnage of approximately 20,000 tons.

British India Steamship Company, and Chairman of the New Zealand Shipping Company, speaking from an experience of 36 years of the Port of London, observed that up to the year 1865 it was the exception for any ship exceeding 2,000 tons gross register to visit the Port. The first steamers of his company employed in the Indian and Australian trades varied in size from 2,000 to 3,000 tons, with a draught of water not exceeding 22 feet to 23 feet. He observed that now the White Star Line steamers trading to Australia were of 10,000 to 12,000 tons, drawing  $32\frac{1}{2}$  feet when fully laden. The New Zealand Shipping Company's steamers were of 9,000 tons and drew 28 feet of water. Sir Thomas Sutherland, the Chairman of the Peninsular and Oriental Company, said that the tonnage of the ships of that company had, on the average, doubled during the last twenty years, and that although their draught was at present limited by the depth of the Suez Canal to 26 feet, there was no doubt that the Canal would in course of time be deepened, and that the draught of the steamers using it would then increase. 10571. 2033.

Another leading shipowner, Mr. (now Sir) A. L. Jones, who is senior partner in the firm of Elder, Dempster & Co., President of the Incorporated Chamber of Commerce at Liverpool, and Chairman of the Liverpool Steamship Owners' Association, said : 4889.

"If London is restricted in the depth and size of her ships, and Hamburg and Rotterdam—those two ports in particular which are going ahead tremendously—are able to get facilities which we cannot get, it is a tremendous drawback to the British shipowners and British commerce altogether. I might go further, because you may look with certainty to the future producing very much larger ships. The economical ship is the large ship, and unless you can provide for the large ship you cannot compete for the carrying trade. The carrying trade is not protected like a railway. Anybody can come into it who can produce a machine cheaper than his neighbour, and his neighbour is always looking for something that can do it cheaper. Then, again, the Englishman does not care what he ships his goods in, whether under the German flag or the French flag. You do not find that feeling with a German or a Frenchman ; he will endeavour as far as he can to ship his goods under his own flag."

39. Throughout the evidence our attention was called to certain general characteristics of London as a port. In some large ports, such as Liverpool, the business is more centralised. Ships invariably discharge and load at certain docks, and goods are discharged upon the quays or into the warehouses at those docks, and thence, by cartage or railway, are removed to their ultimate destinations. But in London, although the various docks play a most important part, and are used by all vessels of the larger kind, a large number of ships are discharged and loaded at moorings, or at wharves along miles of river frontage.

40. Upon the basis of figures supplied by the Board of Trade, the Board of Customs and the Dock Companies, the following estimate has been made of the distribution from this point of view of the whole tonnage which entered the river in 1899. It is not pretended that it is an exact statistic, but it is, we think, sufficiently near to the facts to give a broad view of this division of the trade.

DISTRIBUTION OF SHIPPING ENTERING THE PORT OF LONDON.

	Foreign Trade.	Coast wise.	Total.
	Tons.	Tons.	Tons.
Docks - - - - -	6,319,653	1,000,000	7,319,653
River, i.e., Wharves, Moorings, etc.	2,622,446	4,920,784	7,543,220
Queenborough - - - - -	615,318	29,494	644,812
	9,557,417	5,950,278	15,507,685

Thus the trade done in the river, exclusive of that done in the docks, is about half of the whole trade of the Port of London, even without including Queenborough. It must also be observed that (as we shall point out later in more detail) the docks in London themselves are in great measure only stations at which goods arrive from the sea to be immediately placed upon barges and conveyed to wharves or piers at other parts of the river, or to shipping lying therein. The wharves are thus fed, to a considerable extent, from vessels unloading in the docks. In this way the whole business of the Port of London is scattered over a very large area from Richmond to Gravesend, and a number of different interests—public wharfingers and private warehouse owners, and barge owners, as well as ship owners and Dock Companies—are concerned in the existing system, and will be affected by any changes. This fact, due primarily to the long extent of navigable river through so large and densely populated an area, has given rise to peculiar difficulties in dealing with the subject.

## PART II.

---

### CONTROLLING AUTHORITIES OF THE RIVER THAMES.

1. The Thames Conservancy, including Questions connected with the Deepening and Improvement of the River Channel.
  2. The Trinity House, including Questions connected with Pilotage, Buoying and Lighting.
  3. The Watermen's Company, including Questions connected with the Licensing of Lightermen and Watermen.
  4. The Sanitary Authority of the Port.
  5. The Police Authority of the Port.
- 
-

# 1. THE THAMES CONSERVANCY, INCLUDING QUESTIONS CONNECTED WITH THE DEEPENING AND IMPROVEMENT OF THE RIVER CHANNELS.

41. Until the creation in many places, in the nineteenth century, of special statutory Authorities, the Municipal Authority had by custom the general control of each Port. London was not an exception to this rule, and, with the exception of duties discharged by the Trinity Brethren, the Watermen's Company, and the Admiralty, the control of the river was in the hands of the City Corporation. Since the creation of the Thames Conservancy in the year 1857 the only power connected with the Port left to the City Corporation is that of sanitary regulation. The existing Authority endowed with the widest powers is now the Thames Conservancy.

42. As long ago as 1836 a Select Committee of the House of Commons reported: "that the various conflicting jurisdictions and claims of the Admiralty, the Trinity House, and the Corporation of the City of London over the River Thames below the bridges have had a most injurious effect upon the interests of navigation, and that it is desirable that they should be consolidated and vested in some one responsible body, and that means should be found to provide for the removal of Shoals and Obstructions in the bed of the River." No. 557 of 1836.

Nothing, however, was done until the year 1857, when the Thames Conservancy was created as a corporate body by the Act 20 and 21 Victoria, c. 147.

43. Several subsequent Acts have extended the powers, and area of jurisdiction, and have modified and enlarged the constitution of this body. We may conveniently deal with this subject under the following heads, viz. :—

1. Area of jurisdiction of the Thames Conservancy.
2. Constitution.
3. Powers and duties.
4. Finance.

## 1. AREA OF JURISDICTION.

44. The powers of the Thames Conservancy extend to the whole course of the Thames, tidal and non-tidal. The river is divided by statute into the "upper river" from Cricklade in Wiltshire to Staines in Middlesex, and the lower river from Staines to a line drawn from Yantlet Creek in Kent to the City Stone in Essex. Philipson, 3.

The jurisdiction of the Conservancy "for general purposes" ends at this line.

For dredging purposes the jurisdiction of the Conservancy has been extended by Section 83, sub-section 1 of the Thames Conservancy Act, 1894, further eastwards to a line drawn from Shoeburyness Water Tower in Essex to Eastchurch Church in Kent, excluding that which lies within the jurisdiction of the Conservators of the Medway.

For the collection of port dues the Thames Conservancy Port is, under Section 3 of the Thames Conservancy Act 1894, always to coincide with the limits of the Customs Port, up to a line fixed by the second schedule to that Act, extending from Harwich Naze in the north to the Kentish Coast in Thanet on the south. The Customs Port begins at present far to the west of this line at a line drawn from Havengore Creek in Essex to Warden Point in the Isle of Sheppey.

For the prevention of pollution, the Conservators' jurisdiction extends over the whole catchment area of the Thames, with the exception of;

- (1) That part of such area as is beyond a distance of three miles from the Thames below the western boundary of the County of London.

- (2) The River Lee above the south boundary stones mentioned in the Lee Conservancy Act, 1868, and all tributaries within that catchment area.
- (3) All docks and canals owned by any Company established under the authority of Parliament.

For the duty of preserving the flow and purity of the water by scavenging, the eastern limit of the Conservancy is the western boundary of the County of London under section 91 of the Act of 1894.

## 2. CONSTITUTION.

Philipson, 3.

45. The Thames Conservancy Board under the latest Acts passed in 1894 consists of 38 members, appointed or elected as follows: viz., appointed by the Admiralty, two; by the Board of Trade, two; by the Trinity House, two; by the Gloucestershire and Wiltshire County Councils, one; by the Oxfordshire County Council, one; by the Berkshire County Council, one; by the Buckinghamshire County Council, one; by the Hertfordshire County Council, one; by the Surrey County Council, one; by the Middlesex County Council, one; by the London County Council, six; by the Common Council, six; by the Essex County Council, one; by the Kent County Council, one; by the Metropolitan Water Companies, one; by the Oxford City and County Borough, one; by the County Borough of Reading, one; by the County Borough of West Ham, one. Elected: By shipowners, three; by owners of sailing barges, lighters, and steam tugs, two; by dock owners, one; by wharfingers, one.

Philipson, 69-72.

The Board divides itself into an Upper River Committee consisting mainly of representatives of the counties bordering on the Upper River, and a Lower River Committee consisting almost entirely of Lower River representatives. The work is practically done by these Committees, and the Board meets weekly to confirm or reject the proceedings of the Committees. The accounts of the Upper and Lower River are kept distinct.

74.

## 3. POWERS AND DUTIES OF THE THAMES CONSERVANCY.

46. The principal powers and duties of the Conservators, so far as regards the tidal waters of the Thames, are:

Philipson, 3.

- (1) The government and regulation of all vessels within the Port.
- (2) The improvement and completion of the navigation of the river.
- (3) The appointment of Harbour Masters who have power to regulate the whole traffic on the river, the movements and positions of vessels, and the manner of discharging and loading them.
- (4) The removal of wrecks and other obstructions.
- (5) Dredging for the purpose of maintaining and improving the navigation, and the shortening of bends.
- (6) The licensing of docks, piers and embankments, stages and cranes, the placing and maintenance of moorings, the erection of piers and landing stages, the placing and maintenance of navigation beacons, the carrying out of the Explosives and Petroleum Acts, so far as they affect the river.

The Conservators have power to make bye-laws for the regulation and control of the river.

## 4. FINANCE.

Philipson, 20-24.

47. The revenue of the Conservancy, so far as it is derived from the Lower River, proceeds mainly from the tonnage dues which they are authorised to levy upon ships entering and leaving the port. Coastwise vessels of less than forty-five tons are exempt, and so are any coastwise vessels chiefly laden with corn, fishing smacks, vessels with passengers only, ships with cargo for re-exportation, and ships entering or clearing in ballast.

The Conservators are empowered to demand, and they collect, tonnage dues of one halfpenny per register ton in respect of vessels trading coastwise or to foreign ports north of Ushant, and three farthings per ton in respect of those trading to other ports. They also raise revenue from tolls on barges and pleasure boats, rents for jetties and other accommodations, and dredging licences.

48. We have been supplied by the Thames Conservancy with the following statements of their receipts and expenditure (1) in respect of the river below Teddington Lock, and (2) of the river above that lock, including an estimate as to the division of establishment and office expenses:—

49. It will be noticed that taking together the years 1894 to 1901 the Conservancy have had a considerable total surplus of revenue derived from the river below Teddington, and a small one on the river above that point.

The total expenditure out of revenue upon dredging below London Bridge during the years 1894-1899 inclusive, amounted to £77,647, or 27·7 per cent. of the whole expenditure. The capital expenditure upon dredging during the same years, below London Bridge only, amounted to £50,259. Of this sum £32,867 was spent upon new steam hoppers.

Under the Act of 1894 the Conservancy were authorised to borrow £200,000 for the purpose of improving the river below Staines, and under this power they have raised £100,000. The Secretary to the Conservators stated in evidence that they had not found it to be necessary to raise further loans because (1) they had sufficient funds for current expenditure and (2) the unexhausted borrowing power would have been insufficient to raise capital necessary to meet the large and costly additional works referred to in the Report of the Lower Thames Navigation Commission in 1896.

App., p.12.

Philipson, 65.

QUESTIONS CONNECTED WITH THE PERMANENT IMPROVEMENT OF THE RIVER.

50. The most important function entrusted to the Thames Conservancy was that of maintaining and improving the channels of the tidal river. This duty implies, we think, doing all that is necessary to keep the Port upon a level with the increasing requirements of modern commerce. Our task in ascertaining what, in this respect, these requirements are, has been much facilitated by the fact that we have before us the Report made in the year 1896 by the Lower Thames Navigation Commission which was appointed by the Board of Trade in pursuance of the provisions of the Thames Conservancy Act 1894. We have reprinted this important document without its appendices, as an Appendix to our present Report.<sup>1</sup>

51. The circumstances under which this Commission was appointed are as follows :—

In the year 1887 a strong appeal was made to the Thames Conservancy to improve the navigable channel between Gravesend and the docks. A letter signed by 36 of the most important shipowners and insurance companies was addressed to the Conservancy, drawing attention to the great increase in the aggregate tonnage of vessels entering and leaving the Port (nearly 60 per cent. in the 14 years from 1871 to 1885), the greatly enlarged capacity of nearly all merchant ships, and the conversion, in a great measure, of the merchant shipping of the country from sail to steam. Mention was also made of the “belt of fog” which vessels often encounter unexpectedly either when leaving the docks or when making their way up from Gravesend to the docks. It was stated that several instances had occurred of large ships running aground, and having to be unloaded before they could be got off, and there were numerous patches, it was alleged, in the river below the Albert Docks, where there was not more than 18 ft. at low water. On the whole, it was urged that this state of things was not creditable for the Port of the Metropolis, and that vessels ought to be able to count on at least as much water at all times of tide as was available in the Suez Canal.

The Thames Conservancy did not seriously contest the facts urged, and promised careful inquiry and deliberation.

52. Little, however, appears to have been done by the Thames Conservancy to satisfy the demands of the shipping trade.

In the year 1894 a Bill was introduced by the Thames Conservancy to re-constitute and enlarge the powers of that body. The movement for deepening the river found expression in the House of Commons in the shape of the following instruction, moved by Sir Thomas Sutherland, on behalf of the Shipping Trade, after the second reading of the Bill :—“That it be an instruction to the Committee on the Thames Conservancy Bill that they have power to insert in the Bill, if they think fit, provisions for authorising the Conservancy to dredge the portions of the River Thames, and the estuary thereof, below Yantlet Creek in the County of Kent.” This was opposed by Sir Frederick Dixon-Hartland, who was in charge of the Thames Conservancy Bill, but carried on a division by 269 votes against 112. In the Committee to which the Bill was referred, counsel for the Thames Conservancy expressed the willingness of that body to insert in the Bill powers to dredge (as desired by the Shipping Trade) in such a manner as might be recommended by the Board of Trade “after inquiry and report.” The Permanent Secretary of the Board of Trade appeared before the Committee at their request, and suggested that the inquiry and recommendation as to dredging should be made rather by a Commission than by the Board of Trade. This view was accepted by the Committee, a clause was brought up to carry the matter out, and after the negotiations usual in such cases, it assumed its final shape in what now stands as Section 189 of the Thames Conservancy Act, 1894.

<sup>1</sup> See Appendix A. p. 126, *post*.

53. The section 189 referred to is as follows:—

“The Conservators shall within three months after the passing of this Act apply to the Board of Trade to appoint, and that Board are hereby empowered thereupon to appoint a commission to consist of not more than three persons [to inquire and report to the Board of Trade in the manner and to the extent following (that is to say):—

“(1.) Whether any and what dredging or other operations are practicable and expedient for the purpose of improving the navigation of the Thames and estuary thereof between Thorney Creek in the county of Essex and the Nore light-ship:

“(2.) As to the probable cost of such dredging and other operations (if any) which the said commission may deem practicable and expedient and as to the means by which the funds necessary to meet such cost should be provided:

“The said commission shall hold an inquiry for the purposes aforesaid at such time or times and place or places as they shall determine and they shall at such inquiry hear all such persons by themselves their counsel agents and witnesses as they shall think fit.

“The Conservators shall afford the said commission all such facilities as may be requisite to enable them to visit and inspect the Thames and the estuary thereof for the purposes of such inquiry and report and the Conservators and all persons required so to do by the said commission shall respectively produce all such documents reports contracts plans sections specifications drawings and papers and give all such information called for as may be in their possession or under their control.

“The said commission shall as soon as reasonably practicable after they shall have completed the said inquiry make their report to the Board of Trade.

“The costs charges and expenses of the said commission of and incident to the said inquiry and report as certified by a secretary or assistant secretary to the Board of Trade after consideration of the recommendations in this behalf of the said commission shall be paid by the Conservators.

“A copy of the said report shall on receipt thereof by the Board of Trade be forwarded by that Board to the Conservators and as soon as reasonably practicable after receiving such copy the Conservators shall supply at such reasonable price as shall be fixed by the Board of Trade printed copies thereof to any parties who shall apply for the same at the office of the Conservators.

“If any dredging or other operations shall be recommended in the report of the said commission the Conservators shall as soon as may be reasonably practicable after a copy of such report shall have been received by them as aforesaid either proceed to carry out such dredging or other operations or apply to Parliament for all such powers as shall be desirable to enable them to give effect to the recommendations of the said commission.”<sup>1</sup>

54. Having regard to the instruction passed by so large a majority in the House of Commons (although opposed by the Thames Conservancy), and especially to the proceedings when the Bill was in Committee, we are of opinion that the duty of carrying out any dredging and other operations to improve the channel of the Thames, as recommended by the Commission to be appointed, and of applying to Parliament for any increased statutory powers which might be necessary for that purpose, was clearly imposed upon and accepted by the Thames Conservancy as one of the vital conditions of the passing of their Bill of 1894.

55. The “Lower Thames Navigation Commission,” consisting of Mr. (now Sir John) Wolfe-Barry (Chairman), Admiral Sir G. Nares, and Mr. Lyster, was appointed by the Board of Trade in pursuance of the above-mentioned sections of the Thames Conservancy Act, on the 8th November, 1894.

The Commission held seven sittings and examined 23 witnesses.

These witnesses may be roughly grouped as follows: Four represented the Thames Conservancy, six the larger steamship lines and shipping

<sup>1</sup> It will be observed that, whereas the petition of the Shipowners in 1887 was for the improvement of the river above Gravesend, as to which the Conservancy promised careful inquiry and deliberation, the demand in 1894 was for dredging the Leigh Middle Shoals, which are about 15 miles below Gravesend.

industry, five represented the Port Authorities of Liverpool, the Clyde, the Tyne, and Southampton, and six witnesses were connected with the business of dredging and sand-pumping (two of these being employed by the Thames Conservancy and one by the London County Council), six pilots, the Engineer of the London County Council, the Royal Navy Officer employed by the Hydrographic Department of the Admiralty to survey part of the river, and three witnesses connected with the sea fisheries of Kent and Essex.

The evidence taken by this Commission showed that the owners of all the most important lines of ships trading to London were agreed in asking for a depth of water 30 feet up to Gravesend, and that a number of shipowners asked for the same depth up to the entrance to the Albert Dock.

56. The portion of the Thames Estuary referred by Parliament to the statutory Commission was that extending for about  $8\frac{1}{2}$  nautical miles between Thorney Creek, which is 10 nautical miles below Gravesend and the Nore Light Ship, between which limits are comprised what are generally known as the Leigh Middle Shoals. The Commission could not, however, form a view as to the utility of improving to any given extent the channels in the portion which was referred to them, without taking into consideration the whole question of the possible, or probable, improvements of the river up to the docks. We desire to call special attention to the expression of their views in paragraphs 29 to 38 of their Report.<sup>1</sup>

57. It will be observed—

(1) That the Thames Conservancy submitted to the Board of Trade Commission the following programme of the improvements which they had in contemplation, and which would, when executed, provide the following channels :—

	Minimum Width.	Minimum Depth.	
	Feet.	Feet.	
Channel between Yantlet and Crayford Ness. ( $20\frac{1}{2}$ nautical miles) ... ..	600	24	Par. 31.
Channel between Crayford Ness and Bull's Point. Albert Dock Entrance. ( $6\frac{1}{2}$ nautical miles) ... ..	500	22	
Channel between Bull's Point and the Thames Tunnel. ( $7\frac{1}{2}$ nautical miles) ... ..	300	18	
Channel between the Tunnel and London Bridge. ( $1\frac{1}{2}$ nautical miles) ... ..	200	18	

(2) That the Commission thought it “clear that the navigation of the Thames, which has always been a tidal navigation for ships of large draught, will remain so under the contemplated programme.” Par. 32.

(3) That the Commission felt that their recommendations with regard to Leigh Middle Shoals must be governed by what they had ascertained to be the existing intentions of the Conservators, which they had no power to review, and that, as there was already in existence a good navigable channel through the Leigh Middle Shoals with a low water depth of 25 feet, it was a material fact that the Conservators had no present intention of providing a greater depth than 24 feet at a short distance higher up the river. Par. 32.

(4) That in view of the foreign and home competition and the improvements in other ports, the increase in the size of ships and the consequent great expense of any delay to them; in view also of the fact that great

<sup>1</sup> See Appendix A, page 126, *post*.

delays had been proved to occur by reason of the necessity of waiting for tides, the Commissioners fully agreed with the view strongly pressed upon them by shipowners and others that "much public advantage would be gained if a navigable depth of about 30 feet, suitable for vessels of the largest draught, were afforded at least up to Gravesend."

Par. 35.

(5) That as there is no convenient anchorage for large vessels in the Lower Hope Reach, and as Gravesend is the true objective point in the lower river, no sufficiently useful purpose would be served by undertaking the much longer and more expensive work of deepening the channels of the Leigh Middle until the Thames Conservancy should extend their programme in the direction indicated. For these reasons the Commissioners were unable to recommend the immediate expenditure of money between the Nore and Thorney Creek.

Par. 38.

58. The Commissioners expressed their reasons for thinking that a low water channel with a depth of 30 feet and of adequate width could not be made and maintained through the Leigh Middle Shoals by dredging alone, but that works for confining the course of the river would be necessary. "Whenever," they added, "the Conservancy decide to render the navigation of the river no longer tidal between Gravesend and Thorney Creek, such works would, in our opinion, be prudently and advantageously undertaken through the channels of the Leigh Middle."

Par. 46.

59. The Commissioners thus came to the conclusion that, until the Thames Conservancy extended their programme above Thorney Creek, works in the river between Thorney Creek and the Nore could not be recommended. They found it therefore to be unnecessary to consider the question of the provision of funds for such works. They recognised however that the deepening of the Thames is a matter of great importance, and that the mode in which the necessary funds should be provided demands very careful consideration, and they said, "It seems to us that the financial powers of the Conservators, whenever the fitting time arrives for undertaking the works, should be dealt with as a whole; for though we think it is expedient to provide a deep water channel to Gravesend (or even possibly to the Albert Docks) it is of equal and perhaps greater importance that no financial burden should be so placed as to damage the commercial interests of the Port of London in the present severe competition with other ports in this and foreign countries."

Par. 49.

60. The Commissioners made some recommendations upon minor points which will be found in their Report.<sup>1</sup>

Among these was a recommendation that the small shoal patches in the Yantlet Channel (a second Channel through the Leigh Middle Shoals, pointed out as existing by the Commissioners), which limit its depth to 25 feet, should be removed by dredging, and they added, "If this be done a straight waterway, 600 feet wide, with a limiting depth of 26 feet, would be provided, and the cost of the dredging in question would be so trifling that it might well be defrayed by the Conservancy out of their existing funds." They recommended also that as so many important questions affecting the *régime* of the River have to be dealt with below Yantlet Creek the jurisdiction of the Thames Conservancy should be extended seaward to the Nore.

Par. 50.

61. If the Commission which reported in 1896 did not in absolutely express terms recommend that the Thames Conservancy should take immediate steps to make a low water channel of 30 feet from Thorney Creek up at least to Gravesend, it was because this part of the river did not fall within the terms of their reference. But they made it perfectly clear that in their view it was of paramount importance that this should be done, and they did, in our opinion, virtually recommend that the Conservancy should take at once such steps as should be necessary for the purpose.

62. We have already referred to the words of Section 189 of the Thames Conservancy Act 1894 prescribing that if the Commission to be appointed under this section should recommend any dredging or other operations, the Conservators should, as soon as might be reasonably practicable after the

<sup>1</sup> See Appendix A, page 126, *post*.

receipt of the Report, "either proceed to carry out such dredging or "other operations, or apply to Parliament for all such powers as should "be desirable to enable them to give effect to the recommendations of the "said Commission."

So far as relates to the dredging we may point out that it was work within the existing powers of the Thames Conservancy and that they possessed authorised borrowing power to the extent of £100,000 besides a considerable annual surplus revenue.

63. Sir F. Dixon-Hartland, M.P., the Chairman of the Conservancy, 1504. admitted in his evidence that the Conservators perceived the intention of 1567. the Commissioners, and he admitted also that if the river from Thorney Creek to Gravesend had been explicitly within the terms of the Reference to the Commissioners, and the Commissioners had therefore been able to give a quite direct recommendation as to the deepening of the river, the Conservators would have had no choice but to apply to Parliament under the section in question. As it was, they considered that they were not obliged to apply to Parliament. There was, he said, in the circumstances, 1504. "no mandatory order . . . . We knew we could not go to Parliament "without spending £10,000 or £12,000, and that is how we stood." He also said there would have been no chance of obtaining additional financial 1490. powers unless the Government had taken the matter up and made it a Government measure. The Conservancy were so convinced beforehand that the Government would not do this, that they did not think it worth while to take any steps themselves.

64. The Conservancy, therefore, decided that they were not legally or morally bound to apply to Parliament under Section 189. This appears to us to have been, on the part of a public body charged with vital interests, an inadequate view of their duties.

65. The Conservators might at least, we think, before deciding not to apply to Parliament, have had surveys and estimates made as to the cost of carrying out the views of the statutory Commission. We were informed, More, 286. however, that they took no such steps, because, having already made up their minds that they could not carry out the work, they did not wish to incur this preliminary expense. We were informed that the Conservancy, after considering the Report of the Commission, adopted a modification of the programme, which had been submitted by them to the Commission, and had been considered by that Commission as inadequate. In this modification the Conservancy proposed to dredge as follows :—

	Minimum width.	Minimum depth.	Dixon-Hartland, 1384.
A Channel between Nore and Gravesend - - - -	1,000 feet	26 feet.	
" " Gravesend and Crayford Ness - -	1,000 "	24 "	
" " Crayford Ness and Albert Docks - -	500 "	22 "	
" " Albert Docks and Millwall Docks - -	300 "	18 "	

This programme, though considerably larger than that submitted to the Lower Thames Navigation Commission, materially fell short of the deepening recommended by that Commission, viz., 30 feet up to Gravesend at least.

When the proposed works had been carried out by the Conservancy the navigation of the Thames would still have remained, to use the words of the Commissioners, "a tidal navigation for ships of large draught." We desire to point out that, so far as the Leigh Middle Shoals are concerned, which extend for 7 miles above the Nore, the depth proposed by the Conservancy was merely the natural depth of the river, and that it was the deficient navigable depth through these shoals which formed one of the main reasons for the appointment of that Commission.

More, 237.

66. A commencement of the work under the modified programme of the Conservancy has been made. In November, 1896, tenders were advertised for dredging at least 300,000 cubic yards of material in the Lower Hope and Gravesend Reach. In January 1897, a tender was accepted from a dredging company and under it during 1897 and 1898, 191,000 cubic yards were dredged in the Lower Hope and 174,000 cubic yards in Gravesend Reach. It was stated by the Chairman of the Conservancy, in his evidence, given in November, 1900, that the modified programme was then completed as far as Gravesend, the remainder being in progress. It is obvious, however, that even the modified programme of the Conservancy could not be carried out under their financial resources in any reasonable time, as they have only unexhausted capital of £100,000, and an annual sum available for dredging of about £30,000.

Dixon-Hartland,  
1384

67. After the appointment of the present Commission the Thames Conservancy re-considered their policy, at our instance. The result of their deliberations was thus expressed by the Chairman in his evidence, given in November, 1900. "In view of the tendency to increase the size and draught of ocean-going steamers, the Conservators, though not admitting that the Report of the Lower Thames Navigation Commission contains a specific recommendation that a navigable channel of 30 feet below low water of spring tides should be provided up to Gravesend, are prepared to provide such a channel, if Parliament considers it desirable, and will provide the means for raising the necessary funds."

Dixon-Hartland,  
1384.

Dixon-Hartland,  
7483-84.

68. At the further instance of our Commission the Chairman of the Thames Conservancy produced at a later date an estimate of the cost of making a channel of 30 feet up to the Albert Dock. He also supplied us with an estimate of the increase in the annual revenue of the Conservancy which would be rendered necessary to meet the consequent increase of debt charge, and with the proposals of the Conservancy as to the mode in which such increased revenue should be raised.

More, 5460.

Dixon-Hartland,  
7483.

The estimated cost of deepening the channel to 30 feet at low water of ordinary spring tides up to the Royal Albert Dock, allowing for the necessary training walls between Canvey Island and Shoeburyness, would according to the estimate made by the Engineer to the Conservancy, be £1,649,838, and the cost of providing new moorings would be £45,000, making a total of £1,694,838.

Dixon-Hartland,  
7483.

The consequent increased expenditure on the Conservancy's revenue account, including the additional cost of maintenance as well as the charge for interest, was estimated to reach to at least £160,000 per annum. This increase, added to the average annual expenditure for the five years to the 31st December, 1899, would make the total annual sum necessary for Lower River amount to £235,000.

69. The Conservancy suggested for our consideration that this revenue might be obtained in the following manner, viz., by

Dixon-Hartland,  
7484.

- |   |         |
|---|---------|
| (1) Increase of tonnage dues from $\frac{1}{2}$ d. per ton register on coastwise vessels to $\frac{3}{4}$ d., and on foreign trade vessels from $\frac{3}{4}$ d. per ton register to 1d. Calculated to yield increased revenue of | £24,000 |
| (2) Abolition of exemption from tonnage dues of certain vessels mentioned in Section 155 of Thames Conservancy Act, except fishing boats  | 4,000   |
| (3) Imposition of dues for use of river and moorings by vessels not paying tonnage dues - - -   | 10,000  |
| (4) Imposition of dues on vessels for use of moorings for loading or discharging cargo - - -  | 15,000  |
| (5) Dues on goods to extent of about one-fifth of what is charged upon the Tyne - - -   | 100,000 |

More, 5460.

The estimates put in by the Thames Conservancy are limited to the formation of a channel of 30 feet from the sea to the Albert Dock, and do not take into account works which may be necessary above that Dock.

70. We also received from Sir Alexander Binnie, C.E., an estimate of the cost of forming channels, which he thought to be necessary or desirable from Gravesend upwards. These estimates, for which details were given, were as follows :— 3086

Cost of forming a channel from Gravesend to the Albert Dock, having a depth of 30 feet at low water spring tides, a bottom width of 600 feet and side slopes of 7 to 1	£639,375
Cost of forming a channel from the Albert Dock to the Greenland entrance of the Surrey Commercial Docks, having a depth of 30 feet at low water spring tides, a bottom width of 300 feet, and side slopes of 7 to 1	630,209
Total cost from Gravesend to Surrey Commercial Docks	<u>£1,269,584</u>

It will be observed that Sir Alexander Binnie did not submit any estimate as to deepening below Gravesend.

He laid much greater stress upon the importance, as a matter of public necessity, of the proposed channel of 30 feet up to the Albert Docks than upon the deepening to that extent beyond that point. He expressed his opinion, however, that the formation of the 30 feet channel as far as Blackwall would be desirable, because this would allow large ocean-going steamers at all times of tide to approach and lie afloat at the entrance to the Victoria Docks and that of the East and West India Docks, beyond which point no regular liners of this class now go. He thought, however, that from an engineering point of view it would be quite feasible to carry a channel 30 feet deep at low water as far as the new entrance to the Surrey Commercial and Millwall Docks above the Royal Victualling Yard at Deptford. 3113-18.

He further proposed that above the new entrance to the Surrey Commercial Docks a channel should be formed of a similar width (300 feet) having a depth of not more than 28 feet at low water of ordinary spring tides as far as the lowest entrance to the London Docks. He considered that the existence of the old Thames Tunnel, the crown of which is only 47 feet below Trinity High Water, and which is built of brickwork, and not, as in the case of the Blackwall and proposed Limehouse Tunnels, of cast iron, made the question of deepening the river westward of the Thames Tunnel one that required very careful consideration.

71. The Chairman of the Thames Conservancy contended in his evidence that, until the depth of water over the sills of all the Docks had been much increased, there would be no practical advantage in forming a 30-foot channel, as vessels would have to wait at the Dock entrances until the tide had risen sufficiently to enable them to enter the Docks, and that, lying outside the Docks, they would block the river traffic. This argument appears to us to be less of a reason than of an excuse for the Conservancy not having taken in hand the improvement of the river. It is obvious that the Dock Companies could gain no advantage in deepening the entrances of their Docks if the river remained unimproved, because, as is well-known, large ships, with the river in its present condition, can only approach or leave the Docks at or near the time of high water, and at this time of tide the locks, although perhaps susceptible of some improvement, are not conspicuously inferior in depth to that of the channel of the river at such times. But, further, the argument of the Chairman of the Thames Conservancy altogether ignores the well-known difficulties in navigating the Thames with ships of large draft if delayed by fog or other causes. A considerable amount of evidence was placed before us to the effect that it is no uncommon thing for large vessels ascending the river to be obliged to return to Gravesend if they find it impossible to reach the Docks sufficiently near the time of high water to be certain of entering the Docks, as most of the intervening reaches of the river are too shallow to permit them to anchor with safety.<sup>1</sup> Dixon-Hartland, 1384 ; 1675-6.

Apart, from the question of such dangers and inconveniences, the serious figures of delays to large ships quoted in the Report of the Lower Thames

<sup>1</sup> Sir Thos. Sutherland, 1993 ; Penney, 4231 ; W. H. Sandford, 4414-25.

Navigation Commission in 1896,<sup>1</sup> as due merely to the insufficient depth of water through the Leigh Middle Shoals, a distance of about three miles, where there is a depth of 25 feet at low water, must be enormously increased if the same method of calculation were applied to the navigation of the River above Gravesend, where the limiting depth is about 16 feet.

When the length of this tidal navigation (not less than 15 miles from Gravesend to the Royal Albert Docks) is taken into consideration, it is not surprising that the owners of ocean shipping using the Docks and representing a nett registered tonnage of nearly one and a-half millions of tons should have been pressing the question of deepening the River on the notice of the Thames Conservancy since 1887 at every available opportunity.

72. The evidence which we heard upon the subject of the present condition of the Thames Channels, and as to the necessity for improving them on a large scale and at a considerable cost if they are to meet the needs of modern commerce, corroborates that upon which the Lower Thames Navigation Commission based their calculations. It must be observed that although every witness looked at this matter more or less from the point of view of his own business, and the size of the ships with which he was concerned, there was an almost complete concurrence of opinion that considerable river works were necessary.

3401.

73. Mr. Cattarns, representing the Short Sea Traders' Association, after referring to the inquiry of 1896, said: "The Port itself was suffering "and still is suffering from want of dredging in the river. What is meant "by that is that whilst no doubt there was a very important question to be "considered by the Dredging Commission—and it is quite right that the "Board of Trade should have dealt with it when the Act was before "Parliament; just as Sir Thomas Sutherland and other gentlemen who "gave evidence before that Commission said, no doubt it is a very great "advantage that shipowners should not be delayed one, two, three or four "hours. But in the Port itself the short trader, and the long trader too "for the matter of that, was delayed for days, or at all events for a tide, in "consequence of having missed his tide, and having shallow water to get "over above Long Reach or elsewhere. And while it is very important that "the big vessel should get up to time it is still more important that the "short trader should get up to his time, because the vessel that is delayed "is a vessel trading, say, from Dundee, Aberdeen, or Grangemouth, or "elsewhere, and these vessels are running in direct competition with the "railway companies, the Great Northern and the London and North "Western and others. They have to catch their markets. If they catch "their markets they keep their trade, but if they miss their markets the "trade goes to the railway companies. My own experience is that in "consequence of our vessels, which are built at great expense to catch the "markets, having been delayed, merchants have taken their business away, "and it has shifted to the railway companies, who do their business with "so much more regularity."

3527.

The Short Sea Traders' Association accordingly submitted to us a resolution to the effect that the proposed new Port Authority should in the main spend its funds in broadening the channel and deepening the bed of the river, embanking the sides of the river, erecting quays and piers, and providing deep water berths for steamships of large tonnage.

3401.

The interests of the Short Sea Traders lie mainly in the upper reaches of the river, above Woolwich. The owners of large ocean-going ships are more interested in the River up to the Albert Docks.

1993.

2308.

74. Sir Thomas Sutherland, the Chairman of the Peninsular and Oriental Company, said that he thought it might be sufficient to deepen the channels to at least 26 feet at low spring tides, with a width of channel of 500 feet up to the Albert Dock. Mr. Beckett Hill, a director of the Allan Line, concurred with this view and said, "I see Sir Thomas Sutherland "mentioned 26 feet up to the Albert Dock. I should think that is quite "ample. You must remember that the draught of steamers is limited not "by London alone, but by the whole world. For instance, at Montreal

<sup>1</sup> See Appendix A, page 126 *post*, of the Lower Thames Navigation Commission Report, par. 25.

"you cannot get a draught of more than about 26 feet at the best time of the year. You cannot get through the Suez Canal with more than 25 feet 6 inches. You cannot go to Baltimore or Buenos Ayres with deep draught ships. Ships have to be built so that they can go all over the world. Therefore, I think the deepening of the river might be done slowly and progressively, after the important point is provided of making it safe for a ship to lie somewhere if she misses docking."

Another shipowner of wide and varied experience, Sir Edwyn Dawes, 10571. said, however, "Sir Thomas Sutherland, in the excellent evidence he submitted to the Commissioners, appears to me to have restricted his general ideas as to the requirements to the depth of water in the Suez Canal, through which all the Peninsular and Oriental and British India steamers have to pass; but in the case of the steamers to and from America, Australia and New Zealand no such limitation exists, and the tendency is to increase the size and draught of water to the utmost limits of the port. I express the hope that we shall regard 30 feet as the minimum depth. I may mention the fact that, for instance, the White Star Line steamers trading to Australia are now 11,000 to 12,000 tons, drawing  $32\frac{1}{2}$  feet when fully laden; the New Zealand Shipping Company's steamers, 9,000 tons and 28 feet draught of water. Already it happens frequently that the latter are resting on the mud in the docks when loading, and have to be restricted in weight of cargo and coals. These limitations are injurious to the trade of the Port of London and to the community at large, for, given a sufficiency of cargo, the larger the ship is the more economically she can carry."

75. Valuable evidence upon this point was given by some of the river pilots, *i.e.*, those whose business it is to conduct ships above Gravesend. Mr. Sandford and Mr. Chaney were agreed in thinking that there should be a depth of 28 feet up to the Albert Dock. The former witness thought that the width of the navigable channel above Gravesend should be 800 feet, and he said that for want of space to swing he had often been obliged to take a vessel back to Long Reach when unable to proceed by reason of fog. 4405 and 4461, 4412.

76. We received evidence also from pilots who conduct ships between Gravesend and Dungeness. The general view was that there should be a depth of at least 30 feet from the Nore to Gravesend, available at all tides,<sup>1</sup> though one witness thought that 28 feet would be sufficient. One witness, Mr. Penney, thought that by reason of the rapidly increasing size of steamships even 30 feet at low water would be an inadequate depth if all ships were to avoid all delay. Davies, 4240. 4180.

77. We have no hesitation in stating that it is highly important to the trade of London that a channel of not less than 30 feet in depth at low water of spring tides should be made from the Nore to the entrance of the Royal Albert Dock, and that the width to be adopted for this channel should be, as proposed by Mr. More, 1,000 feet as far as Crayfordness, and from Crayfordness to the Royal Albert Docks 600 feet. We further think that the River should be deepened and improved above the Royal Albert Dock as far as the old Thames Tunnel, now used by the East London Railway.

We think it probable that a depth of 30 feet might be attained, as suggested by Sir Alexander Binnie, as far as the new entrance of the Surrey Commercial Docks, and that a depth of 25 or 26 feet might be adopted as far as the Galleons Entrance of the London Docks. The bottom width of the channel should not be less than 300 feet, but a greater width would be preferable where such a width could be given without sacrifice of depth.

78. There seems to be no doubt that the channel as above recommended from the Nore to the Royal Albert Dock presents no engineering difficulty, and that it could be executed without risk to the riparian properties. Above the Royal Albert Dock questions may arise with regard to the safety of property adjoining the River, and these would affect the precise dimensions of the width and depth to be adopted. These questions would, of course,

<sup>1</sup> Rigden, 4339; Penney, 4178-86; Mundy, 4365-6.

require careful consideration after precise studies have been made of the engineering features of the problem. We do not, therefore, make any specific recommendations regarding the dimensions of the River improvement above the Royal Albert Docks, but merely give our opinion that, as far up the river as practicable, a depth of 30 feet, and that, failing 30 feet, as greater a depth as can safely be provided, should be adopted, and that the bottom width of the improved channel should be made not less than 300 feet, and as much more as circumstances will permit.

The works should and must be done gradually, and may be spread over from eight to ten years.

79. As vessels of large draught now suffer much risk and inconvenience for want of some deep places in which to take refuge if delayed in their passage up or down the River by fog or otherwise, we recommend that, as a first part of the dredging programme, the following holes or basins should be dredged to the depth of 30 feet, which basins would afterwards form part of the continuous channel at approximately the undermentioned places, viz. —

(1) A basin opposite the Shadwell entrance to the London Docks and the Surrey entrance to the Surrey Commercial Docks about 1,500 feet long.

(2) A basin opposite the Limehouse entrance to the West India Docks about 2,000 feet long.

(3) A basin opposite to the new entrance of the Surrey Commercial Docks and the entrance to the Millwall Dock about 2,500 feet.

(4) A basin opposite the Blackwall entrance to the West India Dock about 2,500 feet long.

(5) A basin opposite to the entrance to the Victoria Docks about 2,000 feet long.

(6) A basin opposite to the entrance to the Royal Albert Docks about 3,000 feet long.

(7) Four basins at approximately equal distances between the Royal Albert Dock and North Fleet Hope each 3,000 feet long.

In the cases of all the basins their width should be as great as the circumstances of the locality will admit, and should not necessarily be limited to the widths proposed for the continuous channel. Moorings should be placed at the side of the basins, provided that they do not interfere with the fairway.

The history of the Thames, in which river many deep, isolated holes exist, seems to show that there is little risk of the suggested basins silting up in the interval between their being made and the continuous channel being formed. If, however, any such silting took place it would not be serious, and the cost of its removal would be amply justified by the convenience afforded meantime to shipping.

Neither Mr. More nor Sir Alexander Binnie have any doubts as to the power of the tidal currents of the Thames being fully equal to keeping open the continuous channel when formed without any serious demand for dredging.

The training wall recommended by the Lower Thames Navigation Commission should be begun as soon as possible, and before any dredging is undertaken below the Chapman Light. Information would thus be gained as to whether any, and if so, what amount of dredging would be required below the Lighthouse.

80. We think that when these works have been accomplished the river will bear the same relation to the dimensions of the largest modern ships, as it bore fifty years ago to those of the largest ships then existing.

Without submitting a precise estimate of the cost of the works which we have recommended for the improvement of the Thames, but taking the estimates of Mr. More and Sir Alexander Binnie as a basis of calculation, we think that a sum of about  $2\frac{1}{2}$  millions may be required for the deepening of the Channel from the Thames Tunnel to the Nore, including the suggested moorings and subsidiary works.

Our recommendations as to the Authority by whom these works should be executed, and as to the means of providing the necessary capital will be found in the concluding part of this Report.

More, 297-304,  
and 347-8.

Binnie, 3119-23.

## 2. THE TRINITY HOUSE, INCLUDING QUESTIONS CONNECTED WITH PILOTAGE, BUOYING AND LIGHTING.

81. The Trinity House is derived from an ancient guild or fraternity of pilots and seamen located at Deptford Strond in Kent<sup>1</sup>. The Corporation formerly discharged duties connected with the Government Navy Yard at Deptford, but its duties are now chiefly confined to lighting, buoying and pilotage. The "Elder Brethren" fill any vacancy in their number by election from the "Younger Brethren," and the latter are elected by the "Elder Brethren" from outside.<sup>2</sup>

The Trinity House is the general Lighthouse Authority for England and Wales, the Channel Islands and Gibraltar, but its functions with regard to buoying and lighting river channels and harbours, and with regard to licensing and regulating pilots, do not extend to many ports. Buoying, lighting, and pilotage in the Thames are done by the Trinity House. Kent, 489-90.

82. In the opinion of some shipowners all lighting of coasts and rivers should be an imperial charge, and it was stated that in most countries this expense is undertaken by the National Government, and that light dues are not charged upon shipping. Sir Thomas Sutherland, indeed, said that "excepting Turkey, Great Britain is the only other country, I believe, which charges light dues." Other witnesses, however, alleged that abroad the same dues were virtually charged though under other names. 2020. Anderson, 2101. Cattarna, 3427.

83. We were informed by Captain Vyvyan that, taking the line from Harwich Naze to the North Foreland as a seaward limit, there were within that area eight light vessels, twelve lighthouses, 114 ordinary buoys, and sixteen gas buoys. Out of these there are, west of a line drawn from Havengore Creek to Warden Point, ten lighthouses, one light vessel, six gas and ten other buoys. Prior to April, 1899, lights and buoys were maintained by a tonnage toll levied for each time of passing on all ships carrying cargo, passengers, or mails to or from ports in the United Kingdom, but these tolls were abolished by the "Merchant Shipping (Mercantile Marine Fund) Act" passed in 1898. Under this Act a fixed scale of tonnage payments was adopted, with a limited number of such payments in any one year, no cognisance being taken of a vessel's route, excepting that ships navigating within home trade limits (originally Brest to the Elbe, but subsequently extended to the Eider) pay a less rate than those trading outside this limit.<sup>3</sup> It was represented to us by Captain Vyvyan that under these circumstances, owners of ships trading to London now enjoy a financial advantage over owners of those trading to Liverpool, Glasgow and other ports, who after contributing to the General Lighthouse Fund, have to pay local light dues within the limits of the Port. 8472.

84. With regard to buoying there seems to be some danger of omissions and errors due to the fact that dredging belongs to one authority, the Thames Conservancy, and buoying to another, the Trinity House. Kent, 458-64, 495, 496. Vyvyan, 8512, 8527.

85. A further function of the Trinity House in the Port of London is that of examining persons who are qualifying to be dockmasters in order to certify that they are competent to handle ships.

<sup>1</sup> The mediæval origin of the Trinity House is proclaimed in the antique title repeated in the Merchant Shipping Act, 1894. "The master, wardens, and assistants of the guild, fraternity, or brotherhood of the most Glorious and Undivided Trinity, and of St. Clement in the Parish of Deptford Strond, in the County of Kent, commonly called The Corporation of the Trinity House of Deptford Strond."

<sup>2</sup> Information supplied to the Commission by the Secretary to the Trinity House.

<sup>3</sup> Sailing vessels are also chargeable at a lower rate than steamships.

86. So far as concerns the present inquiry perhaps the most important aspect of the Trinity House is that of Pilotage Authority on the Thames.

Under Section 618 of the Merchant Shipping Act, 1894, which was an Act consolidating or re-affirming previous enactments, the Trinity House continue to appoint and license, after due examination, pilots to conduct ships within.

- (1) The London Pilotage District, consisting of the waters of the Thames and Medway as high as London Bridge and Rochester Bridge respectively, and the sea and channels leading thereto as far as Orfordness to the North and Dungeness to the South.
- (2) The English Gchannel District, consisting of the seas between Dungeness and the Isle of Wight.
- (3) The Trinity House outport districts, comprising any pilotage district for the appointment of pilots with which no particular provision is made by any Act of Parliament or Charter.

Kent, 490

-Sec. 618 (2)

There are at present 37 such outport districts.

It is provided by the same Act that the Trinity House "shall not license a pilot to conduct ships both above and below Gravesend." Accordingly the pilotage of the London district is divided into two distinct parts, viz., that between London and Gravesend, and that between Gravesend and Dungeness, and it should be noted that some pilots only take ships outwards and some only take them inwards. For pilotage purposes "the Port of London," as distinguished from the "London Pilotage District," means the river above Gravesend.

87. There are three classes of pilots licensed for the Port of London by the Trinity House, viz.:—

- (1) The "River Pilots," now about seventy in number. These pilots are licensed to take ships of all kinds, whether "compulsory, Home trade passenger," or "exempt" ships.
- (2) About twenty pilots licensed to take "Home trade passenger" ships, but no other ships.
- (3) About seventy pilots licensed to take "exempt" ships, but no others.<sup>1</sup>

Pilots of the first and second class take fees regulated by the Trinity House, but are allowed to take lower fees when conducting exempt ships. The third class of pilots can make their own terms with ships.

Owners of ships are allowed to select pilots from among the qualified class, who are then known as "choice pilots." Otherwise pilots serve ships from a roster.

A compulsory pilot can oust from a non-exempt ship a pilot of another class, but if, after passing a certain point on the river, a compulsory pilot does not present himself, a pilot of another class can take the ship on.<sup>1</sup>

Sec 631.

88. Under Section 630 of the Merchant Shipping Act, 1894, a poundage of sixpence in the pound upon the earnings of pilots licensed by the Trinity House is paid to the House and carried to their Pilot Fund, together with three guineas annually paid by each pilot upon the renewal of his licence. This fund defrays in the first place such expenses as Trinity House may incur in respect of controlling pilots and pilotage, and the residue is administered by them as a fund for the benefit of pilots incapacitated by old age, illness or accident, and for widows and children of pilots. This is a circumstance which will have to be borne in mind should any change be made in the control of London pilots.

89. Under Section 604 of the same Act it is provided that :—

"The master of every ship carrying passengers between any place in the British islands, and any other place so situate, shall, while navigating within the limits of any district for which pilots are licensed

<sup>1</sup> From information supplied to the Commission by the Secretary to the Trinity House.

“under this or any other Act, employ a qualified pilot, unless he or the mate of his ship holds a pilotage certificate, or a certificate granted under this section applying to the district, and, if he fails to do so, shall for each offence be liable to a fine not exceeding one hundred pounds.”

Such pilotage certificates for ships in this class of business can, under the Act, be given by the Board of Trade.

The Trinity House, as the Pilotage Authority in the London District, examines, under Section 599 of the same Act, Masters and Mates of vessels, including those referred to in Section 604, and grants to them the certificates which make the employment of a qualified pilot in the district non-compulsory.

### *Question of Compulsory Pilotage.*

90. The original rule was that all pilotage should be compulsory within the London District and the Trinity House outport districts, but this rule has become so honeycombed with exceptions, and exceptions to exceptions, that the whole law is in a chaotic condition, and is a fruitful source of litigation and trouble.

Under Section 603 of the Merchant Shipping Act of 1894, pilotage is to continue to be compulsory in all districts where it was compulsory before the commencement of that Act, but all existing exemptions from this compulsory pilotage were to continue to be in force. The London District is one of those in which pilotage is compulsory.

By Section 625 of the same Act, “without prejudice” to this continuance of all existing exemptions it was enacted that the following ships should be exempted in the London District and the Trinity House Outport Districts, *when not carrying passengers, viz.:*—

- (1) Ships employed in the coasting trade of the United Kingdom.
- (2) Ships of not more than 60 tons burden.
- (3) Ships trading from any port in Great Britain within the London District, or any of the Trinity House Outport Districts to the Port of Brest in France, or any Port in Europe north and east of Brest, or to the Channel Islands or Isle of Man.
- (4) Ships trading from the Port of Brest, or any Port in Europe north and east of Brest, or from the Channel Islands or Isle of Man to any Port in Great Britain within the said London or Trinity House Outport District.
- (5) Ships navigating within the limits of the Port to which they belong.

91. Section 625 of the Merchant Shipping Act, 1894, is an attempt to codify the list of actual exceptions, made by previous Acts or Orders in Council, to the rule of compulsory pilotage within certain districts, so far as relates to ships not carrying passengers. It may not however exhaust them, and those not specified are kept alive by Section 603 of the Act. There is, moreover, the complicated system which prevails with regard to ships which do carry passengers, and it must be noted that the presence on board of a single *bona fide* passenger brings a ship within these classifications.

92. The following instances of the present state of the law have been given to us by the Secretary of the Trinity House<sup>1</sup>. He states:—

- (1) That ships registered in the Port of London, when not carrying passengers, are exempt above Gravesend, though subject to compulsory pilotage below it; or, in other words, they are exempt when navigating within the limits of the port to which they belong.
- (2) That all foreign ships with passengers are subject to compulsory pilotage, whatever the port to or from which they go.

<sup>1</sup> In a letter addressed to the Secretary of the Commission dated 27th January, 1902, and see also opinion of Mr. Phillimore on case submitted by General Steam Navigation Company, App. to Report of Select Committee on Pilotage 1888, page 637.

- (3) That British ships carrying passengers are subject to compulsory pilotage if they come to London from any place in the British Islands, but if they come from any place on the Continent east and north of Brest, except, under the Act of 1897, 60 and 61 Vict. cap. 61, from Sweden and Norway, they are not so subject.
- (4) That, therefore, if a British ship comes from Boulogne to London with passengers it is exempt from pilotage; but if the same ship picks up one more passenger at Ramsgate it is liable to be construed that she is subject to compulsory pilotage, unless the master or mate has a pilotage certificate under Section 604 of the Merchant Shipping Act, 1894.
- (5) That vessels in ballast are exempt when navigating from any port in the United Kingdom to any other port in the United Kingdom when not carrying passengers.

Matthews 2331.

93. Complaints were made in evidence that in its practical working the system is full of anomalies. Under it a large British ship in the Baltic or North Sea trade, if not carrying passengers, is not obliged to take pilots at the higher fixed rate, whereas a smaller ship from Nantes, for instance, or Bordeaux is obliged to do so. The case was put by a witness of one of the small sailing ships, such as those which come into London with nuts from Spain. "They may come in several times a year, and they have to pay this heavy pilotage every time, and 20s. for landing money. The Captain knows the river and estuary channels as well as the pilot, and can handle his little ship much better, but he has to pay £7 for what he does not want, and say, carries only 150 to 200 tons. It is these kinds of injustice with regard to port charges which give a port a bad name, and make owners avoid it when ever possible."

Cattarns 3412.

The Chairman of the Short Sea Traders' Association said that the traders whose vessels were exempt had an advantage in this respect in London as against Antwerp and other Continental Ports, where compulsory pilotage exists.

Jacobs (Junr.)  
3723, 3767-71,  
5575-6;  
Humphery 2911.

94. Our attention was also called by owners of lighters and traders interested in the cargoes carried by such craft to the immunity for damage from accidents enjoyed by the owners of ships having on board by compulsion of law the Trinity House pilots. This saving from liability is confirmed in Section 633 of the Merchant Shipping Act, 1894, in the following terms:—

"An owner or master of a ship shall not be answerable to any person  
" whatever for any loss or damage occasioned by the fault or incapacity  
" of any qualified pilot acting in charge of that ship within any district  
" where the employment of a qualified pilot is compulsory by law."

The earliest enactment on the subject was in 1812 (52 Geo. III., c. 39, s. 30). The legal principle upon which the rule is founded is that a man is liable for the acts of those whom he voluntarily employs, but not for the acts of those whom he is compelled to employ. It has been held in numerous cases that at common law a party compelled to take a pilot is not responsible for his acts.<sup>1</sup> The mitigating doctrine has, however, been laid down by the Courts that wherever the accident could be traced in any degree to the acts of the master and crew of the ship, the owner was liable, and they have thrown upon the owner the burden of proving that the casualty was entirely due to the pilot.<sup>2</sup> The result of these rules of law has been to tempt the captain of a ship to assume an attitude of masterly inactivity when he has a compulsory pilot on board. If, in order to prevent obvious danger, he interferes, he makes his owner liable for any evil consequences. If he goes below, or stands by silent, he knows that the law will free his owner from all liability. The result is an inversion of that which has been laid down by the Admiralty as the true rule, viz., that a pilot should be the adviser of the captain, but should not take his responsibilities.<sup>3</sup>

<sup>1</sup> See cases cited in Pritchard's Admiralty Digest, 3rd Edition, page 1349.

<sup>2</sup> See Thames Traffic Committee Report, 1879, page 38, and Pritchard's Digest, page 1351.

<sup>3</sup> Admiralty Navigation and Pilotage Regulations, Sec. 7, and see Thames Traffic Committee Report, pp. 37 and 38.

95. It has been pointed out that the law leads to great anomalies.<sup>1</sup> If a British ship coming from Hamburg, and therefore not compelled to have a pilot, sinks in the Thames a barge with a valuable cargo, the shipowner, if it is the ship's fault, is fully liable, even if he have on board the most highly qualified pilot. But if the same ship should at a later date be coming in from Bordeaux with a compulsory pilot and runs down another barge, no damage can be recovered except from the pilot, and that only up to a statutory limit of £100. If, on the other hand, the barge by its fault should injure the ship, full damages can be recovered by the shipowner from the barge-owner.

It was represented to us by several witnesses that it was unjust that a ship which happens, under one of the above-mentioned artificial distinctions, to be subject to compulsory pilotage, should be exempt from liability for damages.<sup>2</sup> Our attention was called to the fact that although a lighter-owner is compelled to employ licensed watermen he is not exempt from liability on this ground. The grievance in question was strongly put before us by Mr. Hugh Smith, a leading wharfinger. He said :

"The maintenance of compulsory pilotage on the River Thames constitutes a grievance which has for many years been keenly felt. If a vessel navigating the river under a compulsory pilot does damage to a barge, the shipowner is exempt from liability, provided the officers and crew can show that they gave the pilot the assistance he was entitled to, and the pilot is not responsible for damage resulting from his negligence or want of skill, beyond his pilotage fee, and the bond of £100 into which he enters with the Trinity House. If, therefore, by the negligence of the pilot of a ship, a barge containing goods to the value of some thousands of pounds is run down, there is practically no redress, but if a barge does damage to a ship when under pilotage the shipowner can sue the owner of the barge for the full amount of the damage, and can in most cases recover his loss. In view of the constantly increasing steamship traffic on the 25 or 26 miles between Gravesend and London Bridge, over which lighters are continually being navigated, and upon which these conditions obtain, I submit that in the general interest of the port, as well as the interest of the lighterage trade, compulsory pilotage should be so amended that this great injustice I have mentioned may be removed."

Mr. T. W. Jacobs, Junior, the Chairman of the Association of Master Lightermen and Barge-owners, put in a table of cases since the enactment of the Act where, as he alleges, barge-owners have suffered hardship through the law relating to compulsory pilotage. In several instances the action had to be abandoned owing to the impecuniosity of the pilot, and in some cases the pilot was found to be already an undischarged bankrupt. It was stated by Captain Vyvyan that the Trinity House had been legally advised that it was not necessary to withdraw the licence of a pilot who was an undischarged bankrupt. We agree with the barge-owners in considering such a state of things as very unsatisfactory.<sup>3</sup>

97. Evidence was chiefly given by barge-owners, but, ships compelled to have pilots collide with exempted ships upon the same unequal terms. In this case, however, the owner of the exempted ship would be protected to some extent by the limitation of liability for damage under Section 503 (c) and (d) of the Merchant Shipping Act, 1894, a limitation which does not extend to barge-owners.

<sup>1</sup> See Appendix B to Report, *post*, page 130.

<sup>2</sup> Jacobs, junr., 3723 ; 3767 ; Lambert, 3898 ; Hugh Smith, 2528, 10413 ; Williams, 3835 ; B. Jacob, 10654 ; Matthews, 2330 ; Humphery, 2911.

<sup>3</sup> The way in which this state of the law affects both wharfingers and barge-owners was graphically put by one of the witnesses, a private dock proprietor: "Suppose a ship coming down the river in charge of a pilot runs over my barge; the stuff on my barge may be worth £20,000. But what happens? I am introduced to a gentleman on the bridge, and he is supposed to have got only £100, and all I can get out of him is that £100. Whereas, suppose that in throwing off my barge from one of the different wharves that I work for, I knock a hole in a ship and sink it, they will come and take everything I have got—they will make a bankrupt of me if I cannot pay the whole damage."

98. The question whether pilotage should be compulsory, and whether, if so, ships subject to compulsory pilotage should be exempt from liability for damages due to their fault when in compulsory districts was considered by the Select Committees of the House of Commons on Pilotage which sat in the years 1870 and 1888. The Thames Traffic Committee of 1879 also devoted part of its report to this subject. We have inserted in the appendix to our Report<sup>1</sup> passages from these three reports which bear upon the matter. It will be seen that the Select Committee of 1870 recommended the total abolition of compulsory pilotage throughout the United Kingdom; that the Thames Traffic Committee recommended its abolition in the river Thames above Gravesend; and that the Select Committee of 1888 while not recommending that there should be any general abolition of compulsory pilotage expressed the opinion that "the time has arrived when the exemption of the owner from liability for damage done by his ship when the ship is placed in charge of a pilot by compulsion of law, should cease to exist."

99. That modern policy is opposed to compulsory pilotage is shown by a proviso in the Act, Sec. 575(2) that there shall be no compulsory pilotage and no restrictions on the power of duly qualified persons to obtain licences as pilots in any new pilotage districts constituted by the Board of Trade under that Act. Pilotage is free in many ports of the United Kingdom, for example, the Tees and the Tyne, Swansea, Cardiff, Leith, Dundee, and Cork.<sup>2</sup> It must be observed also that under the provisions of Section 578 of the Act, re-enacting previous enactments, the Board of Trade can, by Provisional Order, exempt all ships or any ships in any particular pilotage district, or in any part of it, from compulsory pilotage. Some orders have been made for this purpose by the Board, one of which exempted all ships using the Bristol Channel.

100. Captain George Vyvyan, the Deputy Master of the Trinity House stated before us in evidence that the Elder Brethren "have always been "of opinion that passengers need 'legislative protection,' but that they "would refrain from opposing the abolition of compulsory pilotage "provided that the necessary safeguards for navigation towards the Port "and a proper provision for existing interests 'are secured.'"

101. Some further observations upon this subject will be found in paragraph 325 of our Report.

#### *Other Questions Relating to Pilotage.*

2021. 102. Some shipowning witnesses complained that pilotage charges were unduly high as compared with those made at other ports. Sir Thomas Sutherland said that "casual pilotage" at Antwerp was more expensive than in London, but that lines which employed "choice pilots," *i.e.*, pilots virtually retained by the lines, had in London to pay larger salaries in the course of the year than those which they paid to their own captains. So, too, Mr. Beckett Hill said, "In London the 'choice' pilots will make incomes from £1,000 to £1,500 a year, which is more than "we pay our best captains." Mr. Anderson, the Manager of the Orient Steam Navigation Company, alleged that the pilotage charges were "distinctly higher than in the "competing Ports," and Mr. (now Sir Alfred) Jones said "that "as regards pilotage the most expensive pilotage in England is certainly "that of London," and he alleged that it costs at London "double of what it does at "Liverpool."

App. p. 655. 103. On the part of the Trinity House a table was put in, which shows that the average cost of pilotage per mile is not excessive in London as compared with other Ports, and that the greater cost of pilotage in London is due to the greater length and difficulty of the approach both by sea and river. In this respect Ports like Liverpool and Southampton have a great natural advantage over London.

<sup>1</sup> Appendix B, page 130, *post*.

According to the latest Pilotage Return to the House of Commons, there are 72 ports in the United Kingdom in which pilotage is compulsory, 39 where it is free, and 13 where it is partly free and partly compulsory.

Captain Vyvyan also put in figures which seem to show that the ideas expressed by some witnesses as to the earnings of pilots are hardly borne out by the facts. 8470 and App. p. 656.

104. The complaint was also made that the tariff compiled by the Trinity House was very high on small ships. "The charge is so much per foot of draught. "A ship of 500 tons will probably draw 15 feet; a modern steamer of 3,000 tons will draw possibly only 19 feet, say 22 feet. The former will pay £7 10s. and 20s. landing money, the latter £11 and 20s. landing money from the Downs. This it can be seen at once is very unfair. The charge is excessive on the small ship, and very easy on the large ship. What should be charged is a tonnage rate." Matthews 2330

105. It is thought by some shipowners that the cost of pilotage in the London district is heavier than it need be, by reason of the statutory obligation to employ in each case two pilots, one to conduct a ship above Gravesend, and the other to conduct it between Gravesend and Dungeness. It was said that in the days of sailing ships there might have been good reason for such a rule, because to make an entrance was then frequently a very long and laborious task, which might be too much for the strength of a single pilot, but that this had ceased to be the case in the day of steamships. Hill, 2269; Jones, 4837, 4974.

106. Captain Vyvyan, on behalf of the Trinity House, said that there had once been a class of pilots licensed for through pilotage, and that with the sanction of Parliament the practice might be revived. He thought, however, that there was more reason for a change of pilots in the case of upward than in that of downward-going vessels. In the latter case, the most difficult part of the pilot's work—the navigation of the narrow part of the river—took place when he was fresh. But in the other case, he said; "An inward pilot, if he has had charge of the inward vessel from the Isle of Wight or Dungeness, and has been on the bridge or look-out till he gets to Gravesend, may not be in a fit state to commence the difficulties presented by a narrow navigable channel, beset by barges, small craft, and the outward rush of traffic from the Pool, surrounded by vessels seeking shelter in the docks or in the wharves, and often enveloped in smoke or fog; and, if at night, dazzled by the glare from the numerous lights that line the banks of the river." 8470.

Captain Vyvyan also pointed out that if Thames pilotage were transferred to a Port Authority there would have to be, at some point, a change of pilots, from the Trinity House man in the Channel district to the Port man. 8475.

#### *Question of Transfer of Powers from the Trinity House.*

107. In most of the more important ports of the United Kingdom pilotage is either controlled by the Port Authority, acting through a Standing Committee, or by a special statutory Pilotage Board.

At Liverpool, Belfast, and Dublin pilotage is in the hands of the Port Authority. App., pp. 856, 877, and 919.

At Bristol the pilotage board consists of nine members of the town council, three shipowners, and two pilots. App., p. 869.

On the Clyde pilotage is controlled by a pilot board, created by the Clyde Navigation Act of 1858. App., p. 881.

On the Tyne there is a separate Board of Pilotage Commissioners, constituted under an Act of 1865, and consisting of seventeen members, five representing the Trinity House of Newcastle, six appointed by shipowners, two by the Tyne Commissioners, two by licensed pilots, and two by the Board of Trade. Urwin 5393.

App. 04.

At Hull the pilotage authority is known as the "Humber Pilotage Commissioners," and consists of representatives of the Corporation, of the Hull Trinity House, of merchants and shipowners, and of Humber pilots.

At Cardiff also there is also a statutory Pilotage Board.

108. The opinion was expressed by some shipowners that buoying and pilotage within the limits of the Port of London should be transferred from the Trinity House to a Port Authority.<sup>1</sup> This transfer also forms part of the scheme submitted to us on behalf of the London County Council<sup>2</sup>; and, so far as regards pilotage only, in that submitted by the London Chamber of Commerce<sup>3</sup>.

Vyvyan 8475.

On the other hand the representatives of the Trinity House contended that to take from them any of their powers would not be an advantage to the Port. The absence of complaints on the whole showed, they said, that their services had been satisfactory to the majority of shipowners and to the public. The following observations, which appear, however, to have been specially directed against the idea of the transfer of powers to a municipal authority, were made to us by Capt. Vyvyan :—

"The Port of London, surrounded as it is by dangerous sands, is in need of special protection, and no radical change should take place to jeopardise the safety of shipping using that port without mature consideration. The members of Trinity House are men who are known to be possessed of knowledge peculiarly adapted by nautical experience, by long usage, and by the practice of the duties of buoying and lighting the channels, to perform the functions requisite in the supervision of pilots and pilotage, a supervision which would be difficult to obtain from any municipal body. From the evidence of some of the witnesses at this Commission, economy is put forward as an essential element necessary for the increase of trade in attracting shipping to the Port, and maintaining its supremacy. On that score the Trinity House stand pre-eminent, it being a body having duties of a kindred nature extending to the principal ports in the Kingdom. It already possesses the machinery for carrying on the work, and is able by combination to conduct that work on the most economical lines. Under these circumstances, unless it is intended that the Trinity House still carries out the work I have alluded to, I fail to see how without great injustice and increase of expense you could adopt the system of unification in its entirety. But when you come to dredging, and particularly wreck work, that is quite another matter. I should like to see the powers of the Thames Conservancy largely extended in this line, as in my opinion the Trinity House is not the proper authority for carrying such work out within the limits of the Port, and it could be done more effectively by the river authority, given that the means and the plant were provided."

8475.

The observations made by Captain Vyvyan with regard to the dangerous sands, though no doubt of force in the pilotage district of London, from Dungeness to the Nore, do not apply with any aptitude to the river navigation above the Nore, which is of an entirely different nature, so much so that the pilots are changed at Gravesend.

8472 &amp; 8475.

109. Captain Vyvyan also observed that if the buoying and lighting services were left to the Trinity House it would be convenient that the control of pilotage should remain in the hands of the same authority, because if the pilots were under the buoying authority any changes made could be more readily communicated to them, and they, on their side, could more readily communicate any changes which should be made. This is really an argument in favour of unification of authorities.

### 3. THE WATERMENS' COMPANY, INCLUDING QUESTIONS CONNECTED WITH THE LICENSING OF LIGHTERMEN AND WATERMEN.

110. Another Thames authority which requires notice is the Watermen's Company. This body originated in an old guild dating from early in the 16th century, and it had for many generations the monopoly of the navigation of the Thames under various Acts, or Ordinances of the Crown. Until 1700 the lightermen, or carriers of goods, were a separate body, but in that year an Act was passed incorporating them with the watermen and wherry-men, whose business consisted in conveying passengers, a business which in earlier days employed a great number of row-boats, but is now largely done by steamboats.

Thames Traffic  
Committee  
Report 1879,  
p. 41.

In 1827 the Acts regulating the Company were consolidated by the Act 7 & 8 Geo. IV. c. 75. Under this Act persons who were not either freemen of the company, after seven years' apprenticeship, or apprentices to a freeman or freeman's widow, were prohibited from navigating any craft for hire between Windsor and Yantlet Creek, and persons other than freemen were not allowed to carry goods for hire.

The rights of the Company were curtailed by an Act of 1859, 22 & 23 Vict. c. 133. This Act removed the previous legal incapacity of boats other than those belonging to freemen to carry goods for hire, but required that all barges so employed should be registered with the Company. By the same Act (Section 54) no person is allowed to act as a waterman or lighterman, or to ply, work, or navigate any wherry, passenger-boat, lighter-vessel, or other craft upon the river, within the shortened limits fixed by the Act, *i.e.*, between Teddington Lock and Lower Hope, near Gravesend, except (1) freemen of the Company; (2) apprentices duly qualified and licensed. Penalties for the infringement of this rule are fixed by the Act.

Freedom of the Company was to be obtained by an apprenticeship of at least five years to a freeman or to the widow of a freeman, or to a registered barge owner employing a freeman. Registered owners of barges were also to be deemed to be qualified to be admitted as freemen. In addition to the freedom licences were required. The master of an apprentice might obtain a licence for an apprentice to take sole charge of a boat or other vessel if the apprentice had worked and rowed upon the river for two years and passed an examination before the Court of Watermen.

An Act of 1864, 27 and 28 Vict. c. 113, added to the privileged class the "contract service men," whose status is now defined by sections 301 to 303 of the Thames Conservancy Act, 1894. These are men above 20 years of age who have not passed through the apprenticeship, but have served under contract for two years with any person authorised to take apprentices under the Act of 1859, and have assisted him to navigate a lighter, or to work or navigate a steamboat.

A man who has fulfilled these conditions, and is deemed competent, can obtain from the Watermen's Company a "certificate authorising him to act as a lighterman or to work or navigate a steamboat" (Sec. 303).

It should be observed that by Section 2 of the Act of 1859, a "Passenger Boat" is defined as "any Sailing Boat, River Steam Boat, Row Boat, Wherry, or other like craft used for carrying passengers within the limits of the Act." A "Lighterman" (Section 3) means "Any person working or navigating for hire a Lighter, Barge, Boat, or other Craft within limits of the Act." "Waterman" means "any person navigating, rowing or working for hire a Passenger Boat" (Section 3). The word "lighter" is defined in the Thames Conservancy Act, 1894 (Section 3), as "any barge or other like craft for carrying goods."

111. The Thames Conservancy Act of 1894, following the provisions contained in the previous Act of 1864, exempts from the obligation to employ freemen or licensed men the following craft, *viz.* :—

- (1) Lighters passing entirely through the limits fixed by the Act of 1859, *i.e.* from above Teddington to below Gravesend.

- (2) Lighters navigating the Grand Junction Canal passing into or out of the said Canal from or to the Thames, and not navigated up or down the said river.
- (3) Lighters navigated from places above Teddington Lock as far as London Bridge.

Section 313 also preserves "any rights, privileges or exemptions actually enjoyed at the passing of the Watermen's Company Act by owners of lighters passing along the River Lee and its branches into or from or along the Thames."

As the law is interpreted in practice, craft whose journeys both begin and end within the limits indicated by the Watermen's Act, *i.e.*, between Teddington and Gravesend, must be navigated by a licensed man. Craft (including passenger steam-boats) navigating from outside the lower limit to places within the limits need not carry a licensed man, unless freight is taken in on the way at some place within the limits. In that case a licensed man must also come on board.<sup>1</sup>

112. The 27th of the Bye-laws of the Thames Conservancy made in the year 1898 under the provisions of the Thames Conservancy Act, 1894, and re-enacting with certain modifications pre-existing Bye-laws, is as follows:—

"Any lighter navigating the river shall "when under way have at least "one competent man constantly on board for the navigation and "management thereof and all such craft exceeding fifty tons but of "not more than one-hundred and fifty tons burden shall, when under "way have one man in addition, and all such craft exceeding one "hundred and fifty tons burden shall, when under way have two "men in addition on board to assist in the navigation and manage- "ment of the same, with the following exceptions:—When being "towed by a steam vessel or when being moved to and fro between "any vessels or places a distance not exceeding two hundred yards."

We are informed by the Secretary of the Thames Conservancy (<sup>2</sup>) that the Metropolitan Police Magistrates have given decisions to the effect that the "competent man" within the meaning of this Bye-law must (on lighters the character of whose journey makes them subject to the Watermen's Act) be a freeman of the Watermen's Company, but that the second and third hands need only be physically competent, and need not hold a licence from the Watermen's Company.

Thames Traffic  
Committee  
Report,  
pp. 43 & 44.

113. The Thames Traffic Committee pointed out in 1879 that the law on this matter is full of ambiguities, and leads, according to the interpretation put upon it in practice, to anomalies almost as singular as those connected with pilotage. If, for instance a steamer plies between Southend and London Bridge she is not obliged to employ licensed watermen. If she is transferred to a service from Woolwich to London Bridge, her owners must employ for her navigation men licensed by the Watermen's Company. The same thing would be true of a sailing barge which had worked from the Medway to London, and was then transferred to the river above Gravesend.

114. The Thames Traffic Committee of 1879, after examining the whole question, expressed a strong opinion that, as regards river passenger steamers, "the owners should be left as free "to select their crews as owners of "other passenger steamers."<sup>3</sup> With regard to men on barges the Committee hesitated, not indeed as to the removal of qualification by apprenticeship or contract service, but as to whether or not some proof of qualification by examination should be required. They concluded that "considering "the great difficulty of establishing a satisfactory examination, considering "that the western barges and the sailing barges, requiring at least equal "skill, are admirably navigated by men who are simply selected for the

<sup>1</sup> Information given by the Secretary to the Thames Conservancy in a letter to the Secretary of the Commission, dated 21st March, 1902.

<sup>2</sup> In a letter addressed to the Secretary of the Commission, dated 7th March, 1902, and see 35th Bye-law of Watermen's Company, quoted at Question 11089.

<sup>3</sup> Thames Traffic Committee Report, page 4.

"purpose by their owners, and are not required to pass any examination ;  
 "considering also that the best way of securing good and skilful service is  
 "in general to throw the responsibility on the employer, and to leave him  
 "perfectly free to select whom he pleases, we are not disposed to recommend  
 "any test examination or preliminary proof of qualification. We are con-  
 "firmed in our opinion by the practice on other rivers, namely, the Clyde,  
 "the Mersey, and the Tyne. The physical and other features of those  
 "rivers differ from those of the Thames, but in all of them skill and  
 "experience are required, and on none of them is there any monopoly or  
 "any attempt made to ascertain the qualifications of the men employed on  
 "the navigation by previous examination. On all of these rivers the results  
 "appear to be satisfactory. We are informed by Captain Moodie that at  
 "New York also, where there is an immense and well-conducted barge  
 "traffic, the business of the bargemen is perfectly free. We recommend,  
 "therefore, that the navigation of barges on the river be thrown open  
 "entirely, leaving the men employed in it subject to penalties in case of  
 "misconduct or breach of bye laws, and the owners liable also to civil  
 "damages in case of injury. If this be done the men will be relieved from  
 "original payments, amounting to £3 15s. 6d., and an annual payment of 3s.  
 "now made to the Company."

We are informed by the Board of Trade <sup>(1)</sup> that there has, since 1879, been no legislation which would alter the law relative to this matter as stated on pages 43 and 44 of the Report of the Thames Traffic Committee.

115. A Select Committee of the House of Commons in 1890 went less far than the Departmental Committee. They recommended that steps App., p. 710. should be taken to render the Watermen's Company a less close corporation, that the examination for a lighterman's licence should be more strict than at present, and that any person should be eligible for a lighterman's licence, if found on examination to possess the necessary qualifications.

116. In consequence of a strike by lightermen in 1900 a Bill was introduced into Parliament in 1901 to remove restrictions and enable owners 10413. to employ upon their barges any men whom they might choose. Petitions from ship-owners, merchants, and brokers on the subject were also addressed to the President of the Board of Trade, and have been referred by him 10407. to us.

117. We are informed by the Watermen's Company<sup>2</sup> that the total number of craft registered with them on 31st December, 1900, was 11,118, of which 913 were sailing barges, and the rest "dumb" barges, *i.e.* not using sails. There were besides about 500 sailing barges not registered at Watermen's Hall.

It appears that there are now 5,900 lightermen who are freemen of the Company, 359 non-freemen holding licences, and 1,700 apprentices working on the Thames. About 3,400 of the men and apprentices were stated to belong to the Trade Union called "The Amalgamated Society of Watermen and Lightermen of the River Thames." Gosling, 11128.

118. It was represented to us in evidence that, <sup>3</sup>

- (1) The restriction to licensed men is based on reasons now obsolete. In old days, when the river was the great highway of London passenger traffic, it was thought necessary to adopt a system of licensing with a view to ensure the safety of passengers in small boats.
- (2) The owners of barges, being under unlimited liability in respect of accidents to life and goods, have sufficient interest to make them employ skilled men only upon the barges.

<sup>1</sup> In a letter addressed to the Secretary of the Commission, dated 8th March, 1902.

<sup>2</sup> In a letter addressed by the Clerk of the Company to the Secretary of the Commission, dated 27th January, 1902.

<sup>3</sup> See especially Mr. Hugh Colin Smith's evidence 10413. See also Livesey 10512, Woodward 10526, Hume 10550.

- (3) Apprenticeship is unnecessary, and the practical value of an examination on shore of a man's competence to navigate a barge is nil.
- (4) To a large extent oars, as a means of propulsion, have been replaced by steam-tugs, on which it is not necessary to carry licensed men, so that less special skill is required in the men on the lighters.
- (5) The rules of the Watermen's Company do not in fact ensure competence, because a boy of 16 who has been an apprentice can obtain a licence, while the right to navigate a barge within the limits is denied to skilled men who have worked over the same waters, from the Medway for instance, but have no licence.
- (6) If the restrictions were removed owners would secure a better class of men.
- (7) Under the present law London, by reason of the existence of the monopoly, is exposed to additional risk of its water trade being stopped by a dispute between the lightermen and the masters.
- (8) No such restrictive system exists in other British ports and they seem to be at least as free from accidents.

119. On behalf of the licensed lightermen and the Watermen's Company it was contended that if there were no system of qualifying, there would be great danger to life and property, because men whose skill was inadequate would be employed in times of emergency.<sup>1</sup> The maintenance of the present licensing system was also advocated by a representative of the crews of passenger steamers on the river,<sup>2</sup> who said that the variations of currents made special knowledge on the part of men in charge of barges very important with a view to the safety of steamers, and that only by years of training can the navigation of the Thames be mastered.

Stress was also laid upon the fact that the present system gives a guarantee for the honesty of the men employed, who are often in charge of goods of value, and unpaid dutiable goods.<sup>3</sup>

In reply to the argument that the custom did not prevail at other ports it was contended that in difficulties of navigation, numbers of vessels and craft, and other circumstances, the Thames differs from other ports.<sup>4</sup>

120. On behalf of the Watermen's Company it was maintained that the tests applied to ascertain competence were adequate,<sup>5</sup> and that as licences have to be renewed by the Watermen's Court every three years, and as the renewal depends on continual good conduct and competency, the system is in the public interest. The Court have also power to impose fines and penalties. It was argued that this control is essential in view of the hard life of lightermen and the consequent temptations to which they are exposed. It was maintained that the Company's Court is particularly well fitted to exercise such control because its members are "freemen of the Company who have been "actively and personally engaged in the various "departments of labour on the river as lightermen, bargemen, pilots, &c., and who by industry and attention to their duties have raised themselves to be employers of the working lightermen and watermen."<sup>6</sup>

The system of apprenticeship guarantees, it was said, a long and continuous education. It was stated also that 253 bargeowners signed a petition to Parliament in 1890 against altering the system, and that as many signatures could be obtained at present.<sup>7</sup> It was further pointed out that the Select Committee in 1890, after hearing much evidence, had not recommended the abolition of the present system, so far as examination and licensing by the Court of Watermen is concerned.<sup>8</sup>

<sup>5</sup> Jacob, 10646.

<sup>6</sup> Jacob, 10646.

<sup>7</sup> Jacob, 10646.

<sup>8</sup> Jacob, 10863.

121. It may be added that the Watermen's Company, very different in this respect to many old City companies, depends almost entirely for its revenue upon fees paid on registration of barges, binding of apprentices, and the freedom and the licensing of watermen and lightermen<sup>1</sup>. We are informed that the only property belonging to the Company (not impressed with charitable trusts) is a sum of £6,741 Consols, and two old houses now let at a total rent of £360 a year, in addition to their Hall and its site.<sup>2</sup> Members of the Court perform their duties without remuneration, and, we believe, simply with a desire to promote the general benefit, and they employ inspectors to watch the progress and conduct of apprentices in districts. The company also manage certain charitable funds and almshouses for the benefit of aged and decayed watermen and their widows. It appears from the accounts of the Company that they hold about £45,464 in various stocks for charitable purposes, including the keeping a church in repair.

Our recommendations with regard to the powers of the Company, and to the system of licensing lightermen and watermen, will be found at the end of our report. See Par. 318-321.

#### 4.—SANITARY AUTHORITY OF THE PORT.

122. A full account of the state of the law upon this subject was given to us by Dr. William Collingridge, the Medical Officer of Health of the Port of London. 3643-3701.

The Corporation of London was constituted the Port of London Sanitary Authority in 1872, by the 20th Section of the Public Health Act of that year (35 and 36 Vict. cap. 79), which was as follows:—"The Mayor, Aldermen and Commons of the City of London shall be deemed to be the Sanitary Authority of the Port of London, and shall pay out of their corporate funds all their expenses as such Port Sanitary Authority." The Act also defined the limits of the Port to be those of the Port as established for the purposes of the Customs laws, and gave the Local Government Board power, by Provisional Order, to assign to the Port Sanitary Authority any powers, rights, duties, &c., under the Sanitary Acts, or any of them. These provisions were re-enacted by the Public Health Act, 1875 (38 and 39 Vict. cap. 54), and practically by Sections 110 to 112 of the Public Health (London) Act of 1891 (54 and 55 Vict. cap. 76). Numerous Orders have been made by the Local Government Board under this and other Acts giving specific powers to the Port Sanitary Authority, and approving rules made by that Authority. These powers were enumerated by Dr. Collingridge in his evidence. 3647.

123. The present limits of the Port for these purposes are defined by a Treasury Minute dated 1st August, 1883, and extend from Teddington Lock to a line drawn from Havengore Creek in Essex to Warden Point in the Isle of Sheppey, Kent, and include the mouth of the Medway.

The Sanitary Authority has also powers under the Canal Boats Acts over boats of this class on the Grand Surrey Canal, Regent's Canal and the Thames.

We were informed that during the years 1890-1899 the ordinary expenditure of the Corporation, as a port sanitary authority for the Port of London amounted to the sum of £58,362 6s. 6d., and the extraordinary expenses to £4,900 7s., or a total of £63,262 13s. 6d. The whole of this expenditure is defrayed out of the City corporate funds, and is not charged upon rates. 3647.

124. Dr. Collingridge stated that "on the whole the shipowners are thoroughly satisfied with the conditions which at present obtain," and that they compare London favourably in this respect, especially in the absence of harassing regulations, with foreign ports. This statement is corroborated by the fact that we received no complaints from witnesses as to the administration by the Port Sanitary Committee of the Corporation of their numerous 3661. 3697.

<sup>1</sup> Jacob, 10646, and page 577.

<sup>2</sup> Information given by the Clerk to the Watermen's Company, in a letter to the Secretary of the Commission, dated 10th March, 1902, and accounts of the company.

and most important duties, which include the safeguarding, so far as possible, of London from the entrance, by way of the river, of infection and disease, brought in either by persons or goods, or in the form of unsound food.

#### 5.—THE POLICE AUTHORITY OF THE PORT.

Scott, 6690 ;  
Jacobs, 3741.

Scott, 6392.

Philipson, 84,  
113-4, Hughes,  
186-192.

Matthews, 2345.

125. The police protection and control of the river is in the hands of the Metropolitan Police Authority. That authority hold that the docks are private property, and that they cannot station their police within that area unless it can be shown that rioting is imminent, or unless all expenses are paid. We were informed by the Chairman of the London and India Dock Company that the Company were employing in 1901, 292 dock police of their own, at a cost of £21,000. The Thames Conservancy have no police powers, and employ no police. The observance of their bye-laws in the Port of London is enforced by the Metropolitan Police.

It was submitted by one witness that it would be better that the river police and the dock police should be under the control of a single authority, because it would then be more easy, especially by detective arrangements, to prevent the pilfering of goods.

PART III.

---

THE DOCK COMPANIES, INCLUDING QUESTIONS CONNECTED WITH THE USE OF THE DOCKS.

- 1.—History and description of the docks now controlled by the London and India Dock Company.
  - 2.—Financial position of this Company.
  - 3.—Surrey Commercial Docks.
  - 4.—Millwall Docks.
  - 5.—Other Docks.
  - 6.—Necessary expenditure upon the docks, and reasons of difficulties in providing adequate funds.
  - 7.—Proposals made by the London and India Dock Company, and objections.
  - 8.—Complaints of ship-owners with regard to the Docks.
  - 9.—Complaints of consignees.
  - 10.—Complaints as to Dock Dues on goods.
  - 11.—General Observations.
-

HISTORY AND DESCRIPTION OF THE DOCKS NOW CONTROLLED BY THE  
LONDON AND INDIA DOCKS COMPANY.<sup>1</sup>

126. Until the end of the 18th century there were no wet docks in London, with the exception of one upon a site now included in the Surrey Commercial Docks, and ships were loaded and discharged in the river. Hence, as commerce rapidly increased, there was much overcrowding, enhanced, under the sailing system, by the periodical arrival of large fleets about the same time. In the busiest seasons a ship could only with difficulty make its way up or down stream amid the crowd of moored vessels. Moreover, under an Act of Elizabeth and subsequent regulations, goods could only be landed at a limited number of "legal quays," and, under special permit, "sufferance wharves." These quays becoming insufficient for the purpose, goods had to be discharged into lighters, in which they often remained for weeks at a time, awaiting an opportunity for delivery at the quays, and exposed to the depredations of gangs of water thieves. Government were strongly interested in the provision of some remedy for this last evil, because the state of affairs involved loss to the revenue, and facilitated frauds upon it.

127. Various schemes were put forward, and were considered by Select Committees of the House of Commons in 1796 and 1799. The last mentioned Committee recommended the adoption in substance, of two schemes, one for the construction of a dock for West India ships, proposed by a Committee of Merchants, and one for the construction of a canal across the Isle of Dogs, proposed by the City Corporation. The result of these recommendations was the West India Dock Act, 39 Geo. III., c. 69, which became law on the 12th of July, 1799. The preamble to this Act recites that great delays, damages, and losses had been sustained, "to the hindrance of commerce and the great injury of the public revenue," and that the object in view was that West India produce might be "secured from loss by theft or other causes and the public revenue greatly benefited."

128. The Act of 1799 constituted the West India Dock Company, empowered and required them to construct wet docks, quays, and sufficient warehouses, defended by a high wall and ditch, and provided that the quays should be "legal quays," and that for a period of 21 years all ships discharging goods from or loading goods for the West Indies should come exclusively to the company's dock. The Act also gave to the company the right to levy tonnage rates up to a certain maximum upon all vessels entering the dock, with the exception of Royal vessels.

This proviso was followed in the Act by another exception, which as a precedent in the case of subsequent dock Acts, has proved to be of very great importance. It was enacted in the following words: "Provided always that this Act shall not extend to charge with the said rate or duty of 6s. 8d. per ton, any lighter or craft entering into the said docks, or basins, or cuts, to convey, deliver, discharge or receive ballast or goods to or from on board of any ship or ships, vessel or vessels."

The company also received under the Act the right to charge dues on all goods landed on the quays. The dividend of the company was limited to a maximum of 10 per cent., and the prescribed rates were to be lowered as soon as the financial position would allow. In view of the damage which the owners of certain legal quays and sufferance wharves, lightermen and others might sustain in consequence of advantages given to the company, compensation, assessed by Commissioners, was to be made to them out of the Consolidated Fund. The same Act empowered the City Corporation to make a canal across the Isle of Dogs. The Act also authorised the advance

<sup>1</sup> A useful and carefully prepared statement of this history was put in by the Chairman of the London and India Dock Company. See 5581.

by Government to the Corporation of certain sums to be spent on the canal, and to the West India Dock Company of sums to be spent on the docks.

129. In 1800 an Act, upon the same lines, was passed creating the London Dock Company, and authorising the construction of a dock at Wapping. To this company was given the exclusive right for 21 years of receiving all ships laden with tobacco, rice (not from the West Indies), wine and brandy. In 1803 an Act was passed constituting the East India Dock Company, authorising them to construct a dock at Blackwall, and giving to them a monopoly for 21 years of all ships from the East Indies and China. The Acts of 1800 and 1803 contained provisions similar to those in the Act of 1799, with regard to buildings, limitation of dividends, charges on ships and goods, exemption of lighters from shipping rates, and compensation to wharfingers.

The West India Docks, the London Docks, and the City Canal were all completed by the end of the year 1806, and the work is described by a House of Commons Committee, in 1810, as one "of great and general public benefit accomplished without any charge whatever on the public at large."

130. It is important, in dealing with this period, to notice the Warehousing Act of 1803 (43 Geo. III., c. 132), which instituted the system of bonded warehouses, in which goods could be stored previously to payment of Customs duties. This system was limited by the Acts to the Port of London, and was not in practice for many years extended beyond the dock warehouses. At first, the practically exclusive possession of so convenient a system gave a great advantage to the dock companies over their competitors in the business of warehousing.

131. The monopoly of the West India Dock Company expired in 1823, and a Select Committee of the House of Commons declined to recommend its renewal, grounding their refusal on the superior advantages to the public of free competition. This principle governed, of course, the case of the other two dock companies, and when the East India Dock Company's term of 21 years expired in the year 1827, all shipowners were again at liberty, subject to Customs regulations, to embark and disembark goods in whatever part of the Port of London they found to be most convenient. The same Committee of 1823 recommended the extension of the bonded warehouse system to other warehouses affording adequate security. In 1832 a Warehousing Act (3 & 4 William IV. c. 57) was passed, which conferred a wide discretion upon the Commissioners of Customs, and swept away almost all the restrictions affecting legal quays. The Customs Consolidation Act, 1853, still further extended the powers of the Commissioners of Customs to sanction bonded warehouses and sufferance wharves. Thus the dock companies, after losing their exclusive monopolies, gradually lost, when this recommendation was carried out, the advantage which they had derived from the limitation of the bonded warehouse system to their warehouses. One result of the discontinuance of the 21 years' trade monopolies was the addition of the St. Katharine's Docks to the other docks of the Port. This Dock Company was created under an Act passed in 1825, which conferred the same exemption of lighters from shipping dues as that contained in the previous Acts, and an express exemption of the goods carried in lighters.

132. In 1829 the West India Dock Company purchased the City Corporation Canal, which was, in 1870, converted into the present South West India Dock. In 1828 the East India Dock Company, and in 1831 the West India Company, were granted a new and more convenient constitution under Acts which in both cases re-enacted the lighter exemption, or "free water" clause, and in 1838 these two companies were amalgamated into a single company.

133. The London Dock Company and the St. Katharine Dock Company were amalgamated under an Act passed in 1864, which also enabled the company so formed to purchase the Victoria Dock, which had been

constructed under an Act passed in 1850. The Act of 1864 contained the usual clause exempting lighters from dues. The London and St. Katharine Dock Act of 1875 authorised the construction of the large and costly Albert Dock, which completed the system of this company.

134. The rival East and West India Docks Company obtained in 1882 an Act authorising the construction of the still more expensive Tilbury Dock, and for some years a struggle for trade was carried on between the two companies, in the course of which the rates were reduced. At length, however, the two companies agreed to enter into a "working union," which was sanctioned by Parliament in an Act passed in the year 1888. The amalgamation of the companies was completed by an Act of 1900, and on the 1st January, 1901, they became one company, entitled the "London and India Dock Company," which now controls the whole system, including the West and East and South-west India, the London and St. Katharine, the Victoria and Albert, and the Tilbury Docks.

Scott, 5580.

135. The exemption of lighters entering the docks from shipping dues contained in the first West India Dock Act of 1799 was inserted in the subsequent Acts authorising the construction of docks, and governs both those now belonging to the London and India Docks Company and those belonging to other Dock Companies on the Thames.<sup>1</sup> It received, however, various modifications. The final form which it took is summed up in the following recital contained in the Bill brought into Parliament by the London and India Dock Company in the year 1902 (the latest of several Bills for this purpose) to repeal the exemption in question:—

"Whereas by the Acts relating to the London and St. Katharine Docks Company and the East and West India Docks Company respectively lighters and craft entering into the docks, basins, locks or cuts of either of the two Companies to discharge or receive ballast or goods to or from on board of any ship or vessel lying therein were exempted from the payment of any rates so long as the lighter or craft should be bonâ fide engaged in so discharging or receiving ballast or goods and the ballast or goods so discharged or received were also exempted from any rate or charge whatever."

If the later terms of the exemption are compared with those contained in the Act of 1799 (see paragraph 128 *ante*) it will be observed (1) that the exemption of lighters is declared to be from all rates and not from a specified rate; (2) that they must be bonâ fide engaged in their work; and (3) that goods conveyed in them are in the later form of the proviso expressly declared to be also free from dock charges.

136. The following figures show the number and net registered tonnage of loaded vessels from foreign and colonial ports entering each dock of the London and India Docks Company during the years 1899, 1900 and 1901<sup>2</sup>:—

Dock.	Number of Ships.			Net Registered Tonnage.			Average Tons per Ship.			Tonnage of Largest Individual Ship which entered each Dock.		
	1899	1900	1901	1899	1900	1901	1899	1900	1901	1899	1900	1901
London Dock	571	578	617	447,988	467,316	470,294	785	808	762	2,787	2,919	2,767

Tilbury Dock	674	750	722	839,482	1,054,394	1,157,331	1,245	1,406	1,603	6,701	8,651	8,651

\*In explanation why the tonnage of the largest ship entering the South West India Dock during 1900 and 1901 is relatively so small, the Secretary to the Company has pointed out that the principal entrance of this dock was closed for reconstruction during these two years, so that the admission of the largest class of vessel was not possible during those years. The new entrance was opened on the 12th February, 1902, and will, it is stated, take in vessels up to about 6,000 tons gross register.

<sup>1</sup> See in Appendix C. to the Report (page 133, *post*) extracts from the various Dock Acts.  
Table supplied by the Secretary to the Company.

771-975.

137. We were supplied on behalf of the London and India Docks Company with a full statement as to the character of their docks by Mr. H. C. Baggallay, who had been for three years engineer to the joint committee. We also instructed an independent engineer, Mr. R. C. H. Davison, M. Inst. C.E., to inspect and report to us upon these docks and upon the docks belonging to other companies. His report is among the appendices to our Report, and we refer to it for details.<sup>1</sup>

138. The docks of the London and India Docks Company, by reason of the varying depths of their entrances and also by reason of the varying depths and width of the river channel opposite those entrances, serve shipping of different classes.

The Tilbury Dock is at the disadvantage of being beyond carting distance from the centre of business. It is 26 miles by water from London Bridge, and 22 by rail from Fenchurch Street Station. On the other hand, it faces a deeper part of the river, and it possesses a longer, wider, and deeper lock entrance than any other London dock. It was stated in evidence that the largest ship then afloat, the "Oceanic," with a length of 686 feet and 69 feet beam, could enter Tilbury Dock. The dock can accommodate at its quays about 20 ships of 550 to 600 feet in length, or about 30 ships of the average size of those which come to Tilbury. There are no warehouses at this dock, but the sheds are of solid construction, and the dock is well supplied with lines of rails and railway communication.

The Victoria and Albert Docks are connected by a canal, and form practically one dock. It is, however, impossible for ships of great draught to pass through this canal from the Albert into the Victoria Dock, because the depth of the canal is limited by a railway tunnel which passes beneath it. The new entrance at Galleons to the Albert Dock, constructed in 1866 to meet the increasing draught of ships, is that which is used by almost all the ships which come to this dock. This entrance is about ten miles by water from London Bridge. It was stated by the chairman of the company that there are only 27 ships now afloat which could not enter the Albert Dock. It is in fact used by many large ships, among them by the vessels of the Peninsular and Oriental Line. The Albert Dock, it was stated, can accommodate 28 ships of an average length of 400 feet at its quays.

The Victoria Dock possesses considerable accommodation in the way of sheds, warehouses, granaries and refrigerating chambers. At the Albert Dock there are no warehouses, but numerous sheds. At both docks there are lines of rails in communication with the railways.

The Tilbury and Albert Docks may be classified as one group of the dock system, because they are more modern than the rest, supplied with better plant, and receive ships of larger dimensions, by reason of their superior entrances, and because of the greater depth of the river opposite to them.

139. The next group consists of the East India Dock, the West India Dock, and the South-West India Dock. These docks are from six to seven miles from London Bridge by water and within three or four miles of the busiest part of the City. The East India Docks are suited to ships of a certain class only, such as the smaller vessels of the Union Castle Line, and they take many small sailing vessels.

The West India Dock was in a declining condition till about six years ago, when the entrance lock was rebuilt and extended to a length of 480 feet, with a depth on the sill of 26 feet at high water of neap tides. Subsequently to this improvement there has been an extension of traffic to this dock so considerable that it is in itself an evidence of the advantage of a large and costly improvement of this kind. A similar reconstruction of the lock entrance to the South West India Dock has now been completed.

It was maintained in evidence by Mr. Baggallay that the West India Docks, the oldest in London, "are an illustration of the foresight of those who were responsible for their design, as at the present day there are few docks anywhere built on so good a plan for accommodating large

<sup>1</sup> Appendix D., page 135, *post*.

Scott 643-47

Corrected by Mr. Baggallay to 30 ships, 862.

Baggallay, 839.

Baggallay, 898.

917.

917.

"ships of various lengths." He added with regard to both the West India Docks and the Albert Docks that "it is, in depth only that ships are beginning to outgrow them, and this can be remedied should improvements in the river enable deeper vessels to navigate the river to them."

The group of India Docks are well supplied with warehouses, and have lines of rails in communication with the railways.

140. The third group in the London and India Docks Company's system consists of the London Docks and St. Katharine Dock.<sup>1</sup> All these docks are situated less than a mile below London Bridge, and are in close connection by road with all the central parts of London. There are no railways within these docks, and the land area is almost covered by large warehouses, many of them built nearly up to the water's edge. The St. Katharine Docks are only capable of accommodating the smaller coasting vessels and barges.

In the case of the London Docks the size of the ships which can use them is also much limited by the dimensions of the entrances and internal passages, and by the construction of these water ways with curved and sloping sides suitable to the build of ships of former times, but not to the square built modern ships. The chairman of the London and India Dock Company said *Scott 632.* in evidence that only the smaller ships care to run the risk of navigation in the upper river, and that, for instance, the owners of certain large ships which used to discharge wool at the London Docks have replaced them by still larger ships which now use the lower docks. Hence it is that although the general average tonnage of ships entering the Port of London has greatly risen, the average tonnage of those entering the London and St. Katharine Docks has even had a tendency to fall.

141. It must be observed that although there has been a great increase in the total tonnage using the docks now comprised in this system, the increase has been spread very unequally over the different docks. A table *App., p. 43.* put in by the company shows that in the year 1871 the total net registered tonnage of loaded ships from foreign and colonial ports entering the then existing docks was 1,683,093, and in 1899 was 4,281,389. During this period ~~neither the London nor the St. Katharine Docks have received any large~~ increase of tonnage. That entering the West India Docks has fallen off, though it has been rising again since the completion of a new entrance lock in 1895. During the period of 1871 to 1899 no other important structural improvement took place in the older docks, and it is gratifying to find that in the case where a large improvement was made it has been followed by an increase in tonnage using the dock so improved. The tonnage entering the East India Dock has only slightly increased since 1871. That entering the South West India Dock has slightly decreased, though it is hoped that it will now again increase in consequence of the recent construction of a new entrance. The tonnage entering the Victoria Dock increased greatly between 1871 and 1876, but was about the same in 1899 as it was in 1876. The substantial total increase of tonnage entering from foreign and colonial ports must be put to the credit of the Albert Dock since it was opened in 1880, and of the Tilbury Dock since it was opened in 1886.

#### FINANCIAL POSITION OF THE LONDON AND INDIA DOCKS COMPANY.

142. The total expenditure upon the construction of the docks and warehouses belonging to the system of the London and India Docks Company is estimated to have amounted on the 31st December, 1899, to £19,278,000, about £2,126,000 of this sum representing expenditure out of revenue and reserve funds.<sup>(2)</sup>

<sup>1</sup> See Mr. Davison's Report, Appendix D., pages 134 and 139, *post*.

<sup>2</sup> It will be observed on reference to answers 577-80 that Mr. Scott gave the total expenditure as "approximately" £19,200,000. The figures have subsequently been rectified for the Commission by the Secretary to the Dock Company. The Secretary also states that between the 31st December 1900 and the 31st December 1901, a further sum of £158,358 was expended by the Company on capital account.

App. p. 429.

143. On the 31st December 1900, immediately before the date of the amalgamation referred to in paragraph 118, the total existing issues by the two amalgamated Companies and the Joint Committee of debentures, preference and ordinary stock amounted to £17,824,128. Under the London and India Docks Amalgamation Act of 1900 certain issues of capital have been made by the new London and India Docks Company to replace existing issues. Under the London and India Docks Company (New Works) Act 1901, the Company have obtained further borrowing powers, to the extent of £2,666,666.

The following statement extracted from the Report of the London and India Docks Company for the year ending 31st December 1901 shows the authorised and created capital of the Company at that date :

*Capital Authorised and Created, including Working Capital.  
31st December, 1901.*

144. The totals of the income and expenditure of the London and India Docks Joint Committee from the year 1889 to the year 1900 are shown in the following table:—<sup>(1)</sup>

Year.	Income.	Expenditure. <sup>2</sup>	Balance available for interest on debenture stock, dividends, and other purposes.
	£	£	£
1889 - - - - -	1,628,668	1,207,949	420,719
1890 - - - - -	1,767,166	1,348,544	418,622
1891 - - - - -	1,733,241	1,208,811	524,430
1892 - - - - -	1,825,836	1,263,327	562,509
1893 - - - - -	1,661,554	1,194,270	467,284
1894 - - - - -	1,665,629	1,181,411	484,218
1895 - - - - -	1,693,612	1,218,502	475,110
1896 - - - - -	1,722,745	1,212,669	510,076
1897 - - - - -	1,762,801	1,233,349	529,452
1898 - - - - -	1,704,925	1,189,919	515,006
1899 - - - - -	1,745,965	1,216,733	529,232
1900 - - - - -	1,867,292	1,338,600	528,692

145. The following summary shows the income and expenditure of the London and India Docks Company for the year ending 31st December, 1901:—

*Income.*

	£	s.	d.
Import Rates on Goods - - - - -	1,129,437	3	11
Export Rates on Goods - - - - -	191,049	11	6
Rates and Charges on shipping, including rents of fixed berths - - - - -	502,051	1	8
Other earnings (including rents, etc.) - - - - -	109,848	18	4
Total earnings	£1,932,386	15	5

*Expenditure.*

Wages, etc., at Docks and at Town Warehouses -	630,635	17	1
Salaries - - - - -	122,147	16	1
Other Expenses - - - - -	606,121	2	1
Total Expenses	£1,358,904	15	3

Thus the balance for the year 1901 amounted to £573,482 0s. 2d.<sup>3</sup>

<sup>1</sup> See App. Vol. p. 457. Some rectifications of the figures originally put in have subsequently been made by the Secretary to the Company, on his responsibility, so that all the figures above given do not exactly correspond with those in the table in the Appendix.

<sup>2</sup> The expenditure include interest on certain mortgage debentures and temporary loans, from bankers, and advances made by the London and India Dock Companies on account of new works, which amounted in 1889 to £6,216, and in 1899 to £27,942.

<sup>3</sup> These figures are summarised from those in the "Revenue Account" contained in the Report of the Company for the year ending 31st December, 1901. It is stated by the Secretary to the Company that the "income of the Joint Committee was subject to certain additions and deductions representing the private income and private expenses of the two Companies prior to their amalgamation, and that a comparison between the income of the Joint Committee and the new Company can therefore only be an approximate one."

146. We required from the Company a financial statement distinguishing the income and expenditure relating to their dock business from that which related to their warehousing business. An attempt was made by the Company to furnish these figures, which are given at page 435 of the Appendix Volume. The Company, however, expressed the opinion that the relations between these two branches of their business were so intricate that it was practically impossible to submit a trustworthy statement.<sup>1</sup> So far as the figures go they point to the conclusion that about half of the gross revenue of the Company is derived from warehousing.

147. During the twenty years previous to the final amalgamation of the Companies in the year 1901, a dividend in no year higher than 2½ per cent. has been paid upon the ordinary stock of the London and St. Katharine Docks Company, except in the year 1900, when £2 14s. 3d. was paid. At the beginning of the same period of twenty years a dividend of about 4 per cent. was being paid upon the ordinary stock of the East and West India Docks Company.<sup>2</sup> From the year 1887 to the year 1897 (inclusive) no dividend was paid upon the last-mentioned stock. For the year 1898 a dividend of ⅙ per cent., or 3s. 4d. in the £., was paid, partially out of rectification of accounts, and for the years 1899 and 1900 a dividend of ½ per cent.<sup>3</sup> The two Companies were finally amalgamated into the London and India Docks Company by the Act of 1900, and the Directors declared for the year 1901 a dividend of 1½ per cent. upon the deferred ordinary stock.<sup>4</sup>

#### THE SURREY COMMERCIAL DOCKS.

Malcolm, 1739.

148. These docks are situated upon the south side of the Thames, about a mile and three-quarters below London Bridge. A dock upon part of the site existed more than two hundred years ago. In 1807 the Commercial Dock Company was formed, and acquired this dock and another dock which had been constructed upon an adjacent site by another Company, and constructed new docks and warehouses.

The Surrey Canal Company was incorporated in 1801 by the Act of 41 George III. c. 80. By this and subsequent Acts the Company was empowered to make a navigable canal from the River Thames at Rotherhithe to the town of Mitcham in Surrey, and to make collateral cuts and branches to certain places in Surrey and Kent, and to make an entrance basin and ship lock into the river. By an Act obtained in 1808 the Company were authorised to supply certain towns and districts with water. In 1855 an Act was passed (18 and 19 Vict., c. 134), consolidating the previous Acts and changing the corporate name of the undertaking to that of the Grand Surrey Docks and Canal Company. Powers were also given under this Act for the making of a new entrance from the Thames, additional docks and other works, and the raising of further capital. These new works, comprising a deep water dock of 16 acres, a basin of 3 acres, and a lock 250 feet in length by 50 feet in width, with a depth of water on the sill of 27 feet below Trinity standard, which had been commenced in 1858, were completed and opened on the 6th July, 1860. In the same year, 1860, a further Act (23 Vict., c. 74), was passed authorising the Company to make additional docks and other works, to raise further moneys, and for other purposes. A few years after the passing of the above-mentioned Act the Commercial Dock Company and the Grand Surrey Docks and Canal Company came to the conclusion that

<sup>1</sup> See correspondence on this subject in App., pp. 438, 439.

<sup>2</sup> Appendix, p. 425. In the year 1881 a dividend at 4½ per cent. was paid; in 1882 at 4 per cent.; in 1883 4½ per cent.

<sup>3</sup> Appendix, p. 425, and as to year 1900 the Report of the Company for that year.

<sup>4</sup> Report of the London and India Dock Company for the year ending 31st December, 1901. With the exception of the dividend paid by the East and West India Dock Company in 1898 and the dividend paid by the London and India Dock Company in 1901, all the dividends (it is stated by the Secretary to the Company) have been paid free of income-tax. In 1900, this was, in the case of the London and St. Katharine Dock Company, equal to an additional dividend of 2s. 8d per cent. (Information supplied by Secretary to the Company.)

their joint interests and the interests of the trade of the Port would be promoted by an amalgamation of the Companies, and in 1864 it was decided to apply to Parliament for powers to amalgamate the undertakings. The Surrey Commercial Dock Act (27 Vict., c. 31), which incorporated the two companies under the name of the Surrey Commercial Dock Company, and consolidated their previous Acts, was passed in the Session of 1864. Powers were given under this Act, *inter alia*, to increase the capital of the Company, to acquire additional lands, and to execute various new works, including a communication ship lock between the Lavender Pond of the Commercial Dock and the Stave Dock of the Surrey Docks.

149. These docks are of the following area:—

	a.	r.	p.
Area inside Company's boundaries	370	0	0
Canal premises and other property	81	0	0
Water area - deep	102	1	3
Water area - shallow	63	2	14

The docks are conveniently close to the centres of business. They are much used by the traders in timber, wood goods and grain, and are furnished with large timber sheds and grain warehouses. The premises of the South Metropolitan Gas Company are situated upon the Canal, and large supplies of coal are brought to the docks by ships for the use of that Company. 1774

150. The following table shows the number and tonnage of the ships entering the Surrey Commercial Docks for the three years ending 31st December, 1901<sup>2</sup>—

Surrey Commercial Docks.	Number of Ships.			Net registered Tonnage.			Average Tons per Ship.			Tonnage of largest Individual Ship which entered the Docks.		
	1899	1900	1901	1899	1900	1901	1899	1900	1901	1899	1900	1901
	1,274	1,466	1,363	907,347	1,076,518	1,018,349	712	734	747	2,811	2,426	2,542

151. Subsequently to the amalgamation in 1864 the system of this Dock Company has been greatly altered and extended. A new dock, known as the Canada Dock, 1,508 feet in length by 454 feet in breadth, with a water area of 15½ acres, was constructed and opened in November, 1876. Four grain warehouses have been erected, having together a storage capacity of 168,000 qrs. To provide under-cover accommodation for wood goods the Company have built twenty-three blocks of sheds, covering an area of 46 acres, and having a storage capacity of 61,500 standards, or 202,950 loads.

There has since 1864 been a capital expenditure of £484,914 upon these last-mentioned works. In 1894 an Act was passed authorising the Company to alter and extend their works, and to raise further capital. These extensions comprise the construction of a new dock, new locks and other improvements.<sup>3</sup>

Malcolm 1742

App., 1. 202

Malcolm 1742-3.

<sup>1</sup> See Mr. Davison's Report, Appendix D., page 174; *post*.

<sup>2</sup> Appendix, p. 198 and subsequent information supplied to the Company. In comparing this table and that in paragraph 154 with the table in paragraph 136, it should be noticed that the last mentioned table refers to ships entering with cargo from foreign and colonial ports.

<sup>3</sup> The following statement has been made in a letter addressed on the 14th March, 1902, by the Secretary of the Surrey Commercial Dock Company to the Secretary of the Royal Commission:—"Particulars of the Dock Extension works now in progress are set out in the evidence given before the Royal Commission, on behalf of the Company, by Mr. W. F. Malcolm (see Minutes of Evidence of the 30th November, 1900, page 84, No. 1742). Owing to engineering difficulties which have arisen in the course of the works, and have involved a modification of the original plans for the construction of the Entrance Lock, it is impossible to estimate, with accuracy, the total cost of these works. The Company have already spent about £700,000 included in the present capital of the Company, as above stated, and it is anticipated that a further expenditure of £200,000 will be required to complete the works and provide the necessary equipment for the dock. To meet this expenditure the Company have borrowing powers to the extent of £108,000, which, at the price obtained for the last issue of Debenture Stock, would realise £140,400, and it is assumed that this, in addition to an amount of £70,000 in hand, may suffice to complete the works."

152. The following Balance Sheet of the Surrey Commercial Dock Company is extracted from the Company's Report for the year ending 31st December, 1901 :—

Dr.		BALANCE SHEET, 31ST DECEMBER, 1901.		Cr.	
To CAPITAL, viz. :—	£ s. d.	£ s. d.		£ s. d.	£ s. d.
Ordinary Stock - 1,353,814 - -			By Docks, Warehouses, Canal, Land, &c., as per last Account - - - 2,433,788 18 1		
Preference Stock A - 154,000 - -			By New Works and Out- lay on New Extension - 128,708 18 3		
Do. B - 199,000 - -					2,562,497 16 4

	£.	2,741,527 17 5		£.	2,741,527 17 5

The Revenue Account of the Company, as given in the same Report, for the years 1900 and 1901 is as follows :—

1900 and 1901 is as follows. —

Dr.							Cr.						

The dividend declared for the year ending 31st December 1901 on the Ordinary Stock was 5 per cent. During the two preceding years a dividend of 5½ per cent. and a bonus of 1½ per cent. had been paid.<sup>1</sup>

1814. 153. It will be observed that out of the revenue for the year 1901 the sum of £15,691 was derived from canal earnings, and £11,174 from rents of properties. Mr. Malcolm said in his evidence: "Our income is very largely derived from very valuable fixed properties that we have. If that property had not been turned into docks at all, but had been left as it was we might have received a better income from ground rents or houses than we are now receiving upon the docks. The fact is, all our profits arise in a great

<sup>1</sup> Annual Reports of the Company.

“degree from the happy circumstance that our predecessors bought property which was at a comparatively very much less value in those days than it is to-day.”

#### [MILLWALL DOCKS.

154. The Millwall Dock Company was incorporated by the “Millwall Canal Wharfs Graving Docks Act, 1864.” The property of the Company is situated on the Isle of Dogs, on the northern shore of the Thames, adjoining the India Docks on their south side. It comprises an area of 233½ acres, with a total water area of about 36 acres. There are numerous sheds, but no bonded warehouses. The import business of the Company chiefly consists in grain; they also receive much timber. These docks are dependent upon a single entrance lock, 450 feet in length, so that ships of a large class cannot pass through, except at high tide, when both pairs of gates can be open. Duckham 976.

The following table shows the number and tonnage of the ships entering the Millwall Dock for the three years ending 31st December, 1901<sup>1</sup>—

Number of Ships.			Net Registered Tonnage.			Average Tons per ship.			Tonnage of largest individual ship which entered the dock.		
1899	1900	1901	1899	1900	1901	1899	1900	1901	1899	1900	1901
1,337	1,418	1,411	940,005	1,089,119	1,140,806	703	761	808½	4,755	4,454	3,355

155. These docks appear to have been much neglected in the past.<sup>2</sup> The dock are now, however, being provided with a new granary, new sheds and other equipments for the timber trade, and new plant at a cost estimated to amount to £200,000.<sup>3</sup> This cost is being met by a distinct “Millwall Dock Equipment Company.”

156 The Report of the Company for the year ending 31st December, 1901, Trotter 7038. shows that its stocks then stood as follows:—

	Authorised.	Received.	Unissued.
	£	£	£
Ordinary Stock - - - - - Act 1864	510,000	509,700	300
Do. - - - - - „ 1879	90,000	90,000	—
Do. - - - - - „ 1887	100,000	51,000	49,000
5 per cent. Preference Stock - - „ 1866	490,000	490,000	—
4½ per cent. Preference Stock - - „ 1882	250,000	250,000	—
New 5 per cent. Preference Stock - „ 1887	200,000	200,000	—
5 per cent. Debenture Stock, Acts 1864 to 1882	443,457	443,457	—
4 per cent. ditto - - - Act 1887	100,000	60,000	40,000
	£2,183,457	£2,094,157	£89,300

<sup>1</sup> Duckham 977 and information as to years 1900 and 1901, subsequently supplied by the Secretary to the Company. See also note to paragraph 149.

<sup>2</sup> See Mr. Davison's Report, Appendix D., page 151, *post*.

<sup>3</sup> In a letter dated the 13th March 1902 and addressed to the Secretary of the Commission, the Secretary of the Millwall Dock Company has made the following statement with regard to these works:—“The cost is being met through the medium of the Equipment Company, which Company has entered into an Agreement with the Dock Company to provide the necessary buildings and plant on land leased to them by the Dock Company, the land being re-let to the Dock Company, together with the buildings and plant, etc., at a rental equal to 6 per cent. per annum on the whole of the capital outlay. The Millwall Dock Equipment Company has raised the whole of the capital required for present purposes by the issue of £125,000 4½ per cent. First Mortgage Debenture Stock and £75,000 being 75 per cent. of the 10,000 Ordinary shares of £10 each.”

1141. The total market value of the different stocks was estimated by the chairman of the Company, when he gave his evidence in November, 1900, to be £1,567,851. The actual expenditure upon the property appears to have been about £330,000 short of the capital actually subscribed, inasmuch as £100,000 was originally paid as commission for issuing and guaranteeing the capital, and £230,000 of the capital was improperly distributed as dividends.

1130.  
1132.

157. The income of this Company for the year ending 31st December, 1899, was £222,284, and its expenditure was £191,023.<sup>1</sup> The Company has to pay £24,572 as interest on debentures, so that, after setting aside a sum for special dredging, a small sum only was left for distribution among holders of first preference stock. The accounts of the Company show, however, that there was a rapid increase of business during the two following years ending 31st December, 1901. The total income for the year 1900 was £260,018, and the total expenditure £226,702. For the year 1901 the total income was £293,570, and the total expenditure £249,020.<sup>2</sup>

It appears from the statements made in the annual Reports of the Company that this increase of shipping and business was largely due to the loading of transports with stores for the war in South Africa. It should be noted that, before this exceptional business began, this Company were able to do little more than pay the interest on debenture stock.

#### OTHER DOCKS.

Glass, 3591.

158. Under the Regent's Canal Act, 1812, a Company was formed for the purpose of making a navigable canal from the Grand Junction Canal in Paddington to the Thames at Limehouse, and their powers included the right to maintain a basin and channel at the mouth of the canal so as to allow ships to lie in the basin. The property of the Company now consists of the Limehouse Dock, a little more than two miles below London Bridge, the Regent's Canal and the Hertford Union Canal, and the Brent Water Reservoir at Hendon. The business of the Company largely consists in the distribution by their canal of coal and timber brought by sea to London, and in this and other respects the main work of the dock consists in feeding the canal. The dock has a water area of about ten acres.

Glass, 3592.

3621.

The Great Eastern, Great Northern, Midland, Great Central, and London and North Western Railways have goods termini on the banks of the canal.

The Company have spent considerable sums upon their dock, which appears to be in good condition.<sup>3</sup>

159. The following minor docks or wharves belong to various railway companies, namely :—

Brentford Dock, belonging to the Great Western Railway Company.

Chelsea Dock, belonging to the West London Extension Railway Company.

Poplar Dock, belonging to the Midland Railway Company.

Deptford Dock, belonging to the London, Brighton and South Coast Railway Company.

The Poplar Dock (North London Railway) is on a larger scale. It was originally a reservoir or timber pond belonging to the East and West India Dock Company, and connected by a canal with Blackwall Basin. It has no independent entrance from the Thames. This property, together with

<sup>1</sup> App. 534. The figures stated in the Appendix have subsequently been rectified by the Secretary to the Company, who has given an explanation of a slight difference.

<sup>2</sup> These figures are taken from the annual reports of the company for the years 1899, 1900, 1901.

See Mr. Davison's Report, Appendix D., page 134, *post*.

land on which a station has been built, is leased by the Dock Company to the North London Railway Company for a term of 999 years from the year 1850, at a rent of £1,200 a year and half the wharfage dues to be received by the lessees. The water area of the dock which has been constructed on the site is  $7\frac{1}{2}$  acres. The capital expended upon the dock is stated to be £135,733. The Poplar Dock, though not capable of receiving large ships, receives a large number of small vessels; the railway is in communication with other great railway lines, and the company transacts through it a trade of considerable value. Baggallay,  
941-47.  
Dunn 11566.  
11616.

160. The Limehouse Dock, which is practically the mouth of a canal, and the Poplar and other railway docks fall into a category different from that of the large public docks previously mentioned. They may be regarded as riverside terminal stations. We shall not, therefore, further refer to them, or include them in the proposals which we shall make in the last part of this Report.

#### NECESSARY EXPENDITURE UPON DOCKS AND REASONS OF DIFFICULTIES IN PROVIDING ADEQUATE FUNDS.

161. The Chairman of the London and India Docks Company, in his evidence, roughly estimated at "two or three millions" the expenditure upon the docks of the Company, which would be "necessary for meeting all the dock requirements of the Port on very moderate terms." In other words, he thought that two or three millions would be barely sufficient for that purpose. The works which he considered to be immediately necessary were:— Scott 5626.

- (1) An extension of the Albert Dock upon land adjoining the existing dock held by the Company for this purpose. The engineer's estimate for this work was £1,500,000, but in Mr. Scott's opinion it would be advisable "to go on a basis of £2,000,000;" 5636.
- (2) The construction at some of the existing docks of new quays, new entrances or passages, dredging operations, the erection of new grain silos, and accommodation for refrigerated meat, the acquisition of new tugs, and, generally, increased plant. 5662.

In the remoter distance, and not included in the estimate of "two or three millions," lies, in Mr. Scott's opinion, another great work. "To-day," he said, "we find that Tilbury is "practically full, and, if the trade of "London goes on developing in the coming ten years as it has done in the "past, I am perfectly certain that it will be necessary to take into "consideration an extension of Tilbury Dock as large as that of the Albert "Dock which we now contemplate." 5663.

162. We have endeavoured, upon all the evidence before us, and assisted by surveys and confidential estimates made for us by Mr. R. C. H. Davison, to arrive at an estimate of the total cost (1) of bringing into a good state of repair the properties belonging to the London and India, Surrey Commercial, and Millwall, Dock Companies; (2) of effecting such improvements as would be requisite in order to bring the existing docks of these Companies to a degree of efficiency which would meet the needs of the Port, assuming that the river channels are deepened and enlarged in the way which we have recommended; and (3) of making the proposed extension, or new dock, near the Royal Albert Dock.

163. We have arrived at the conclusion that the total cost of these works cannot be safely estimated at less than £4,500,000. We think that an expenditure of this amount, apart from any later extension at Tilbury or elsewhere, will have to be made within the next few years, if the Port of London is to be restored to its proper position. These works should proceed concurrently with the deepening of the river.

We desire to add that the above estimate has been arrived at upon consideration of the best materials available to us, but that it should be clearly borne in mind that the Dock Companies have had no opportunity of testing by cross-examination or otherwise the accuracy of Mr. Davison's report. Hence, it will be understood, our estimate is provisional only, and is advanced with the reserve to the Dock Companies of full power hereafter to submit their own estimates.

Scott, 5795, 5626,  
5662.  
5769.

164. The London and India Docks Company, as we have shown from the evidence of their Chairman, fully admit the need of very considerable works, and profess entire willingness to carry them out, if they had the means to do so. They are prevented from doing so, they allege, by their poverty alone, and by the practical exhaustion of their power to raise further capital upon a revenue which is inadequate to secure a fairly good return to the whole of the existing capital. The attempt made by the company in the year 1900 to obtain from Parliament powers to raise an increased revenue by dues on all goods and lighters entering the docks, with a view to raising more capital, was the cause of the proceedings which led to the institution of the present inquiry.

165. It seems, at first sight, strange that the revenue of the London and India Docks Company should not have increased in proportion to the immense increase in the sea-borne trade of London, of which their Company has had a full and increasing share. The increase of trade is shown by the following statistics of shipping entering the Port and docks with cargo.<sup>1</sup> They refer to foreign and colonial trade only, because the statistics of coastwise trade, having been collected on different principles in different years, are misleading.

PORT OF LONDON.					THE DOCKS OF LONDON.			THE DOCKS OF THE LONDON AND INDIA DOCKS COMPANY.

166. In 1889 the docks of the London and India Docks Company received 38 per cent. of the total tonnage, with cargo, entering the Port of London in the foreign and colonial trade. In 1901 they received 48 per cent. During

<sup>1</sup> App. 236 and 454, and information as to the last two years was supplied by the Secretary to the London and India Dock Company.

the same years there was a large increase in the total tonnage of coastwise vessels using these docks. App., p. 454.

While there was between the year 1889 and the year 1901 an increase of 66 per cent. in the tonnage in the foreign and colonial trade entering the docks of this Company with cargo, the gross revenue derived from the docks only increased from £1,628,668 in 1889 to £1,931,765 in 1901, that is to say, by about 18 per cent. See *ante* paragraph 126.

167. On behalf of the Company the following explanations have been given to account for the fact that, with docks used for the most part to their maximum power, and with an increasing trade, the revenue has for many years been insufficient to permit either the payment of adequate dividends upon ordinary stock, or the raising of large sums of new capital for improvements. The company allege that the conditions under which they are compelled to work do not allow them to earn an adequate income. Their income is derived from three chief sources, viz. :—

- (1) From the tonnage dues which they are authorised to levy, up to a certain maximum, upon shipping entering the docks.
- (2) From dock dues up to a certain maximum upon goods landed upon, or loaded from, their quays, and
- (3) From warehousing.

168. Mr. Scott gave the following explanation of the reasons why the London and India Docks Company did not, when he gave his evidence, charge ships the legal maximum of 1s. 6d. per registered ton. Up to the year 1889 the still divided companies were waging a competitive war and had to keep their rates low to attract ships. In 1889 under the Working Union Act the companies came together, but were still bound by certain agreements with some of the shipping companies. When these agreements had expired, the united Company were free to make a charge, and the temptation to do so was great. Mr. Scott stated that if the London and India Docks Company were to raise their tonnage dues on ships by 6d. per ton to the legal maximum this step would produce £100,000 a year, and that if, instead of allowing ships to be free of rent for four weeks, the company charged, as they were entitled to do, a rent of 2d. a week per ton from the date of entrance, they could raise a further large sum. 6026. 5651. 5597.

These steps, however, Mr. Scott said the Company were "loth to take," because they believed that "the lower the charges on shipping can be kept the greater will be the advantage to the Port." Notwithstanding this consideration the Company, within eight months from the date of this evidence, at the beginning of the year 1902, imposed the further charge of 6d. per ton on ships entering the docks. This step has been taken in opposition to an important expression of opinion by shipowners against any increase in dues on shipping. 5597.

169. With regard to the second source of income, that from dues upon goods landed upon their quays, the case of the London and India Docks Company, which is also in this respect the case in some degree of the other dock companies, has been stated before us at great length. They allege that from about three-fourths of the whole of the goods which pass through the docks they now receive no profits at all, or at most a low rent paid for the temporary use of the quays. They say that during the last twenty years the proportion of goods on which the companies receive no dues has constantly increased. Scott 5587. Hardy 6905.

To make this matter intelligible, it is necessary to state shortly the custom prevailing at the Port of London.

170. Import and export goods in the docks either pass through the hands of the dock companies, or are loaded from or delivered to lighters overside, or are dealt with on what are called "overside" conditions (see *infra* paragraph 172). In the first case they are subject to statutory dues which up to certain maximum rates the dock companies have power to levy. Hardy 11651

Hardy 6905.

Import goods in this case are either warehoused by the companies themselves, or are delivered by them direct to the consignees. Only a minor proportion of the goods which pass through the docks are, however, dealt with in this way. It is estimated by the London and India Docks Company that 80 per cent. of the cargo loaded into ships in the docks is brought alongside in lighters, and that 75 per cent. of the cargo discharged in the docks is taken away in the same manner by the consignees. In consequence of the statutory exemptions in the Dock Acts securing to lighters the free use of the waters of the docks the companies obtain no revenue from dues on goods so brought in and taken out. These observations apply not only to the London and India Docks Company, but to the other dock companies of London.

Sutherland 1997.

171. At Liverpool and other large ports the duties of the shipowner end when he has discharged the goods over the ship's side. The cost of sorting and taking delivery of goods falls upon the consignees. From the point of view of the shipowner this is unquestionably the best system, because it enables him most quickly to get rid of his cargo, take in a new cargo, and depart. The custom of the port of London, on the contrary, is that the shipowner's contract does not end until actual delivery has been taken by, or on behalf of, the consignees, subject to the condition that the consignee is ready to take delivery in the time from the report of the ship expressed in the bill of lading or agreement, and, in default of agreement, not later than 72 hours from the report.

Hardy 6905.

Certain North American lines have succeeded in establishing a bill of lading which makes the sorting and re-delivery fall upon the consignee, and so overrides the London custom. With this exception, the cost of sorting the goods and delivering them to their respective consignees falls in London upon the shipowner.

Hardy 6905.

172. Shipowners can sort goods on deck in the docks and deliver them overside to lighters employed by or on behalf of the consignees. In this case no payment whatever is made to the dock companies. But with large and mixed cargoes this process is impossible, or, at least, involves intolerable delays. The larger shipping companies have therefore entered into arrangements with the dock companies by which all the goods, or the great bulk of them, are discharged on to the quays and there sorted and delivered into the barges of the consignees.<sup>1</sup> Goods in this case are held to be delivered upon "overside conditions," paying no dock dues, and the consignee (subject to the condition, under Section 493 of the Merchant Shipping Act, 1894, of being there within a limited number of hours after the ship's report) can claim delivery of them into his barge, exactly as if the quay were a part of the ship's deck.

Hardy 6905.

Scott, 5597.

173. The Merchant Shipping Act, 1894 (section 493 (4)) embodies a provision that "if any goods are, for the purpose of convenience in assorting the same, landed at the wharf where the ship is discharged, and the owner of the goods at the time of that landing has made entry and is ready and offers to take delivery thereof, and to convey the same to some other wharf or warehouse, the goods shall be assorted at landing, and shall, if demanded, be delivered to the owner thereof within twenty-four hours after assortment; expense of and consequent on that landing and assortment shall be borne by the shipowner."

174. Reference has been made in paragraph 171 to the important exception established by some shipping lines trading to London from the United States and Canada to the rule that the cost of assortment and delivery of goods to their owner falls in London upon the shipowner. The "London clause" in the bill of lading used by these North American lines was first introduced in the year 1888.

Apr p. 493.

The Bill of Lading in question contains a special "London Clause," of which the material part is as follows:—

"The steamer-owners shall, at their option, be entitled to land the goods within mentioned on the quays, or to discharge them in crafts hired by

<sup>1</sup> See paragraph 178 *infra*.

"them, immediately on arrival, and at consignee's risk and expense, the steamer owners being entitled to collect the same charges on goods entered for landing at the docks as on goods entered for delivery to lighters. Consignees desirous of conveying their goods elsewhere shall, on making application to the steamer's agents or to the dock company within 72 hours after steamer shall have reported, be entitled to delivery into consignee's lighters at the following rates, to be paid with the freight of the steamer's agents against release, or to the dock company if so directed by the steamer's agents."

The Bill of Lading then states the rates in question, with special provisions as to discharge of grain. These charges now amount to 1s. 9d. per ton upon most articles.

The effect of the "London Clause" practically is to introduce the Liverpool custom so far as regards the cost of sorting and delivering the goods, since the cost falls upon the consignees from the time when the goods are put upon the quay. Scott, 5592.

175. The question has been raised in the Law Courts whether these clauses in the Bill of Lading are valid in view of the custom of the Port of London, and of the provisions of section 493 (4) of the Merchant Shipping Act. The validity of the clause has been sustained by the Courts on the ground that shippers of goods who accept the Bill of Lading contract themselves out of both the custom of the Port and the provisions of the Statute.<sup>1</sup>

It is, however, alleged by traders that this form of agreement has been practically forced upon owners of goods by the combined action of the shipping lines above referred to, and that merchants have thus been deprived of the right of free delivery. Witnesses expressed the view that the special charge was detrimental to trade, and that it would be preferable that the cost of sorting and delivering goods should be included in general freight. Cobbett 9229.  
Stewart 9981.  
Kingsford 10081.  
Roffey 10019.

176. On the other hand ship owners expressed their approval of the "London Clause" on the grounds that it facilitated the quick discharge of cargo, and that the owner of goods ought to pay for the cost of sorting. Mr. Scott pointed out that notwithstanding this arrangement, or perhaps because of it, the North American trade had during recent years increased far more rapidly than any other. We are informed that a Bill is before the Senate of the United States of America prohibiting the insertion in Bills of Lading of clauses imposing on the consignee any charges which would by law or custom of the country of destination fall upon persons other than owners of goods. There can, in our opinion, be no doubt upon one point, viz., that the quick discharge of cargo is in the interest of all who are concerned in the trade of the Port. Sutherland 2060.  
Anderson 2143  
Scott, 5597.

177. The representatives of the London and India Dock Company claim that, legally speaking, the Dock Companies are entitled to levy statutory dues upon all goods which are landed on the quays, even when immediately transferred to barges. The Joint Committee of the London and India Dock Companies made, in the year 1896, an attempt to institute the system of a charge of 6d. per ton upon goods so landed and transferred. This failed, however, to obtain the support of all the shipowners, who felt that it would be practically impossible for them to recover the charge from the consignees, and the Peninsular and Oriental Company threatened to build rival wharves on the river. The Joint Committee, finding themselves unsupported by the shipowners, did not feel strong enough to encounter the opposition which their proposal would have met with from merchants and wharfingers and other riverside interests, and therefore did not persevere. Scott 5589.  
Scott 5727-38.  
Sutherland 1968.  
Scott 5737.

178. Although the London and India Dock Company receive no tonnage charge upon goods landed on the quays for transfer into barges, they have in many cases arranged with shipowners to receive from them rent or

Scott 5597,  
5724-38.

Sutherland 1951.

Scott 5823.

payments for the use of their quays, sorting sheds, and hydraulic cranes, but this source of revenue produces an income far below that which they would receive from dues on the goods thus landed and dealt with. Previously to the year 1889 the Dock Companies themselves with their own labour unloaded the goods thus dealt with from the ships and sorted and delivered them. Under the custom of the Port the shipowners were charged with the cost of this. The dock labour strike in 1889 put an end to this system, and now the unloading of ships and sorting and delivery of goods is for the most part done by the shipowners with labour directly employed by them.

Scott 5771.

179. It will be seen that the great grievance of all the London dock companies is the exemption of the lighters from dues, and their statutory right to enter and leave the docks without any payment in respect of the goods which they carry off. This right of free use of the water area of the docks has been confirmed to the owners of lighters by provisions inserted in the Acts by which the original and all subsequent dock companies were constituted. The companies, however, take up the position that these privileges, which were not unreasonable under the circumstances of a hundred years ago, have long ceased to be so and have become a great injustice to the companies. The first companies, they say, were secured in their position by statutory monopolies of certain branches of trade. When the dock companies enjoyed such advantages, it was, they contend, natural that the Legislature should not only have given large money compensations to persons injured by the institution of the monopolies, but should have allowed lighters to enter the docks freely, and obtain what share of business they could.

Scott, 5771.

180. The companies further contend that, when the statutory monopolies came to an end, the position of the docks was still protected by the practical monopoly of the only bonded warehouses in which dutiable goods, at a time when almost all foreign imports were dutiable, could be deposited, and by the fact that in the days of sailing fleets and a great entrepôt trade, warehousing had a much more important relative part than it now has. Therefore, they say, the Legislature, after the cessation of the monopolies, did not hesitate to continue the "lighter" exemption clause in favour of rivals whose competition was so little formidable. Subsequently, however, the position has been changed by several causes to the detriment of the dock companies and to the advantage of the lighter owners and wharfingers. One cause was the gradual extension by the Customs Authorities, after the recommendations of a Select Committee in 1823, of the privileges attached to a bonded warehouse to many other warehouses in the Port and City of London. Another cause was the extension of Free Trade, and the reduction of dutiable goods to a small number of articles. Also, under modern conditions of shipping and communication a great quantity of goods are not now warehoused at all, but are taken straight into consumption.

Scott, 5820-26.

Scott 5597.

181. All these changes, the companies allege, have diminished the motives which made goods pass through their hands, and have given to the owners of lighters and wharves advantages which were never contemplated when the Acts were passed containing the exemption which has since been followed as a matter of common form. The original lighters were small barges propelled by oars, but modern ones are often of comparatively large tonnage, convey a considerable amount of cargo, and are most often towed by tugs. It was argued that an exemption which may have been just in the case of really light craft, is not equitable in respect of considerable vessels.

Scott, 5597.

182. Our attention was also called to the labour and expense to which the companies are put without remuneration in passing thousands of lighters in and out at entrance locks; to the loss of water which this process involves, rendering additional pumping in of water necessary; to the consequent increased deposit of mud in the docks and the resulting increased expense in dredging; to the crowding and congestion by barges of the water outside and inside the docks, and to other minor grievances of a like character.

Mr. Baggallay, who had been Engineer to the London and India Company, 6701. estimated the cost, direct and indirect, to which the company was put by the use of the docks by the barges, as amounting to £50,000 a year. Complaints of the same kind were made to us by the representatives of the Surrey Commercial and Millwall Dock Companies.<sup>1</sup>

183. The main grievance of the dock companies is, however, that whereas the docks were constructed at great cost upon the assumption that profits would accrue not only from tonnage dues on shipping but from the dock dues on goods, the effect of the "free water" clauses under modern conditions is to deprive the companies of such dues in respect of three-fourths of the goods which enter the docks as imports and exports. The following table in proof of this assertion was put in by Mr. Scott on behalf of the London and India Docks Company. Scott 5597.

ESTIMATED TONNAGE OF IMPORTS AND EXPORTS FOR THE YEAR 1899.

	Imports.	Exports.	Total.
Number of Vessels discharging or loading -	2,800	1,860	4,660
Net registered tonnage of ships - - -	4,281,389	3,203,098	7,484,487
Estimated tonnage of goods discharged or loaded - - - - -	3,946,527	2,413,037	6,359,564
Tonnage of goods on which landing or wharfage charge levied - - - - -	1,085,820	453,431	1,539,251
Tonnage of goods discharged or shipped over-side on which the Joint Committee got no charge whatever - - - - -	2,860,707	1,959,606	4,820,313
The percentage the goods discharged or shipped over-side bear to the total tonnage of goods shipped or discharged - - - - -	72	81	76

184. The goods thus diverted from the quays of the dock company are carried off by the lighters to public and private warehouses, and by railway companies in the same way to their own wharves and quays. The London and India Docks Company urge that the right of the lighters to use the docks without payment is one which although originally sanctioned by Parliament has long ceased to be justified by any special rights or privileges such as those which were originally possessed by the companies. Scott, 5715. Scott, 5771.

185. The Chairman of the London and India Company said, in evidence: Scott 5597.  
 "To prevent commerce from being driven away to other ports, and to enable even the opposing wharfingers to continue to carry on their business, the Dock Company submit that the best and simplest course is to free the docks from hampering and unfair restrictions, and so enable them to earn a living wage, and be in a position to meet the demands of commerce as they arise.  
 "It is submitted that lighters should not, without giving a return, or corresponding benefit of any kind, use freehold property which has cost millions, and enjoy the benefit of the police and labour systems generally of the docks, and that, too, not only without paying rent or due of any kind on their own account, but without paying a penny on the goods which they are occupied in diverting at the dock's expense from the dock quays and warehouses."

186. Complaints to the same effect were made by the representatives of the Surrey Commercial and the Millwall Dock Companies. Malcolm 1769. Duckham 981.

<sup>1</sup> See, as to grievances of these kinds, Scott 5597, Baggallay 6703, Malcolm, for Surrey Commercial Dock Company, 1740, and Duckham, for Millwall Dock Company, 979-81. In the preamble to a Bill of 1902, the London and India Dock Company allege that in the year 1900, 126,361 lighters or similar craft with an aggregate tonnage of upwards of 8,000,000 tons "entered, used, and departed from the docks, basins, and works" of the Company.

Malcolm 1845,  
and App., p. 200.

The Chairman of the Surrey Commercial Dock Company put in a table showing that the percentage of sawn wood goods delivered overside into barges in the docks of the Company to the total of those delivered overside and landed on the quays had increased from 18·92 per cent. in 1890 to 40·58 per cent. in 1899. Mr. Malcolm said :—“It is the general tendency of trade of all kinds to endeavour to economise every charge as much as possible, and if a man having a private timber wharf in London finds he can send a steamer into our dock, and send his barges for it, and that we can charge him nothing on the goods that occupy our docks or on the barge, it is naturally to his interest, instead of having these goods landed in the dock, to take them away direct from the ship’s side to his own private wharf. That tendency is increasing year by year.” He said also :—“What we plead for is to be allowed some compensation in the shape of a tax upon the barges using our docks for their own benefit and not for ours, and on the goods which are taken away loaded in the barges from the ship’s side, for which at present we receive no remuneration.”

981.

187. Mr. Duckham, the General Manager of the Millwall Dock Company, stated that on the average 40,000 barges pass through their lock every year bringing in goods direct to vessels, or taking out goods direct from vessels. He said that of the cargo exported from Millwall Docks 90 per cent. is received in this way, and that of the goods brought into the dock by sea-going vessels about 60 per cent. is removed in this way.

The Commission has been supplied by the Millwall Dock Company with the following table with reference to the import of grain :—

Year.	Reported for all the London Docks	Discharged at Millwall,	Percentage of total Imports.	Landed in Millwall Docks.	Percentage of quantity discharged.	Overside in Millwall Dock.	Percentage of quantity discharged Overside.
	Quarters.	Quarters.		Quarters.		Quarters.	
1899	9,051,000	2,923,531	32 per cent.	1,392,864	47 per cent.	1,530,667	53 per cent.
1900	9,285,800	3,372,586	36 per cent.	1,564,602	46 per cent.	1,807,984	54 per cent.
1901	10,507,500	3,835,149	36½ per cent.	2,165,727	56½ per cent.	1,669,422	43½ per cent.

6019  
8308]

188. This, then, is the position taken up by the London and India Docks Company, supported on this point by the other public Dock Companies. They admit, to use the words of one of their leading Directors, that “it is unquestionably unsatisfactory to have the docks of the Port of London managed by companies which cannot develop it as it should be, and which cannot meet the demands for capital expenditure commensurate with the size and importance of the Port.” But they allege that the cause of their deficient financial vitality is the drain upon profits, which should legitimately come to them, by rivals who have grown under favouring circumstances from a position of toleration on account of insignificance to one of superior participation in the general profits of the trade.

189. Although the misfortunes of some of the dock companies may also to some extent be due, as some adverse witnesses alleged, to rash and premature expenditure of capital and to errors in administration, yet we think that to a considerable extent their explanation of the causes of their present position is a true one. They are, we think, in these respects the victims of a change of circumstances which has dispossessed them gradually of the advantages which they once enjoyed. They have rendered great services for a hundred years to the Port of London, and they are entitled to much sympathy; but when they ask, as they do, for power to tax their rivals in trade in order to restore a lost position, serious difficulties and objections arise.

PROPOSALS MADE BY THE LONDON AND INDIA DOCKS COMPANY,  
AND OBJECTIONS.

190. The East and West India Dock Companies, in the year 1855, brought forward a Bill in the House of Commons repealing the exemption clauses in their Acts and empowering the companies to levy dues upon the lighters entering the docks. This Bill was rejected on a division on the second reading by a majority of 249 to 26. Mr. Cardwell, intervening on behalf of the Government in this debate, said that there had been by the original Dock Acts "what was known in law as a complete dedication to the public of the newly-created water space, in as far as lighters were concerned," and that "before a bargain of that kind is altered by the House a very strong case should be made out by the parties concerned." Scott, 5759.

A further application of this kind was made by the dock companies to Parliament in the year 1900, with the object of obtaining power to levy dues on barges, and rates on goods so conveyed, but the Bill introduced was withdrawn upon the intervention of the President of the Board of Trade, and the present Commission was appointed. Bills with the same object were introduced in the Sessions of 1901 and 1902. Scott, 5626.

191. The definite proposals placed by the London and India Docks Company before us were as follows.— Scott, 5626.

That the London and India Docks Company should have (1) power to charge dues on barges with a maximum rate of 4*d.* per ton, estimated on the basis of 3*d.* per ton to produce the sum of £56,250; and (2) power to levy dues on goods estimated to produce the sum of £177,833. In the consideration of the above powers the dock company expressed themselves as willing to agree (1) That the reasonableness of the amount of the charges on goods as between the different classes of goods on which the rate shall be levied shall be subject to a right of appeal to the Railway Commissioners. (2) That, in place of the present maximum tonnage dues of 1*s.* 6*d.* with rent from the date of entrance of 2*d.* per ton per week now authorised as chargeable on shipping, there shall be substituted maximum dues of 1*s.* 4*d.* to include freedom from rent for four weeks. (3) That the maximum dividend to be paid on the capital stocks of the company shall be 4 per cent., and that the surplus shall be applicable to any of the following purposes only:—(a) The making good of the deficiency of any previous dividend from the date of obtaining the above mentioned powers. (b) The redemption of loan capital. (c) The provision of a reserve fund not to exceed 10 per cent. of the total nominal amount of the capital stocks of the company. (d) The reduction of charges on goods and shipping. (4) The dock company to undertake to complete with all despatch the proposed extension to the south of the Royal Albert Dock.

192. The proposal of the London and India Docks Company that powers should be given to them to levy dues upon lighters and upon all goods entering the docks, was strenuously resisted by the representatives of the public and private wharves and warehouses who appeared before us, and by the owners of lighters. It will be seen from paragraph 196 that it was also opposed by the London Chamber of Commerce.

193. With regard to the free water clauses, those representative witnesses urged that the policy of Parliament has been invariable for a hundred years, and from the earliest Dock Act to the latest. They referred to the fact that vast sums of money have been expended upon the construction of wharves and warehouses; they allege that reliance upon the free use of the dock waters by lighters has to a large extent been the motive for such expenditure, and they contended that a change in this policy would have for a result a considerable depreciation in the value of riverside property. "We consider," said the Chairman of the Wharfingers, Warehousekeepers', and Granary-keepers' Association, "that the traders of the Port of London should not be subject to these recurring attempts to re-open and set aside a settlement which has been solemnly confirmed in every Act of Parliament since the

Marten Smith,  
2466.

Hart-Davis, 2567.  
Scott, 5712-15.

Rogers, 8693.  
2466.

“docks were established, and upon the basis of which their privileges were granted. The abrogation of this condition would be a manifest injustice to the owners and occupiers of wharves which have been erected, maintained, and increased on the faith of the promises of the Acts governing the regulation of the docks, and confirmed from time to time by Parliament.”

Some attempts were made by the representatives of these interests to place before us an estimate of the value of the wharves and warehouses. They did not find it possible to do so with any approach to accuracy. Reasons were given for thinking that the capital value of the 320 wharves and waterside premises which line the river from Westminster Bridge to East Greenwich on the south side, and from Blackfriars Bridge to Silvertown on the north side could not, including the working capital, fall short of £13,000,000. The total assessment of the gross annual value of this property amounts to about £415,000.

Smith, 2452-2466,  
Hart-Davis, 2591.  
App., p. 208.

Rogers, 1234.

194. It was argued that many of the wharfingers, by making lower warehouse charges, are now able to compete against the dock companies in spite of the natural advantage possessed by the dock warehouses in their proximity to the quays where all large ships discharge; in spite, also, of the cost of lightering between the docks and the wharves. If, however, the balance now existing were disturbed by a charge placed upon the lighters using the docks, the wharfingers, it was alleged, could no longer afford to make such lower charges, and the result would probably be that part, at least, of their present trade might be diverted to the dock warehouses. In this case the dock companies would not only gain the money proceeding from the charge upon the lighters, but would achieve a great diversion of business to their own warehouses at the expense of the wharfingers.

195. The second proposal of the London and India Docks Company, viz., that they should be authorised to levy dues upon all goods which enter the dock, was also strongly resisted by the representatives of the riverside interests, and for much the same reasons as those for which they are opposed to a charge upon lighters. They stated their belief that if such dues are levied by the dock companies and used for the purpose of effecting great improvements in the docks, the balance of advantages as between the dock companies and the wharfingers would be seriously affected, to the detriment of the latter. The new charges might at once diminish the cheapness which is the advantage of the wharves and be used to increase the efficiency and therefore the attractive power of the docks.

On this point the wharfingers were supported by the authority of the Chairman of the Peninsular and Oriental Steamship Company. He said, that if the docks were “put in a proper and efficient state to do a great deal more work in the way of storage than they do now” it would, in his opinion, “be rather a bad look out for the wharves.”

8685.

1252.

Scott, 5626.

196. Mr. J. I. Rogers, who appeared as representative of the London Chamber of Commerce, and also in his private capacity as a merchant, said that in his opinion if the dock dues proposed were authorised “a gigantic monopoly would be created in favour of the dock company at the cost of the wharfingers and merchants of London.” The same witness described the proposal of the dock company as one “which, while increasing their own revenues, would depreciate the property of others, in order to make up for their own losses.” The goods on which the dock companies seek to levy new dues are not those which pass through their own warehouses and are already subject to their consolidated rate, but those which pass through the docks on overside conditions without directly contributing to the dock revenue. From the point of view, therefore, of a change which may affect and disturb the existing competition, the wharfingers regard the proposed dues upon goods and dues upon barges in the same light.

5644-47.

197. The point was put to Mr. Scott, the Chairman of the London and India Docks Company, whether the imposition of the proposed new charges, estimated to amount to £235,000 a year, would not modify the present terms of competition between the dock company and the wharfingers,

and whether the company would then get not merely the £235,000 but the profits upon some traffic deflected from its former course into their warehouses. Mr. Scott admitted that this might to some extent be the case. 5645. 5713.

198. The reasons advanced by the wharfingers against the proposals of the London and India Docks Company to impose a charge on barges and on overside goods are, in our opinion, so weighty that we cannot recommend the proposals for adoption. For this reason we forbear to discuss the details of the Company's proposals as set out in paragraph 191. Apart also from the injustice to the wharfingers' interest, we think that any change in a system which has been so long in existence would prejudicially affect the whole trade of the Port of London, in which the business of wharves, independent of the docks, has under the present arrangements grown to a magnitude unequalled in any other port.

199. We gather from the evidence taken upon the subject, that, although the riverside interests and warehousing merchants are strongly opposed to the levy of dues on goods by the dock companies, on whom they look as rivals in trade in their warehousing capacity, they are prepared to acquiesce, if this should be necessary for the improvement of the Port, in a levy of dues upon all import goods by an authority of a public character.<sup>1</sup> This view is clearly expressed in the statement of evidence put in by Mr. Rogers on behalf of the London Chamber of Commerce. After many meetings and investigation of opinion the Chamber of Commerce came to the conclusion that "if the whole tidal basin of the Thames were under one authority, allied with or including a trust for the navigable waters of the Port, the necessary revenues would be found firstly in the present sources, as paid to the Conservancy or others; secondly, if a tonnage rate on ships were found to be insufficient to bring the Port up to date, the merchants of London would not object (under a Trust) to a reasonable rate being charged on all goods whether taken to dock warehouses or the public or private wharves. Such a charge would be differentiated from the late proposal of the dock companies by the fact that it would affect all interests alike, and would give no one any preferential treatment." Rogers, 1170 1261-2.

#### COMPLAINTS OF SHIPOWNERS WITH REGARD TO THE DOCKS.

200. Sir Edwyn Dawes, British India Steamship Company, said, speaking for shipowners: "It is despatch more than anything else that we want, owing to the increasing value of the ships we employ." The view that despatch in loading and discharging cargo is even more important than low port charges was supported by Sir Thomas Sutherland, M.P., the Chairman of the Peninsular and Oriental Company, and by other representatives of ship-owning companies who appeared before us.<sup>2</sup> Not only does the greatly increased capital value of modern ships make it necessary that they should earn profits without waste of time, but the punctuality to dates due to the use of steam power makes it most important that the time of vessels competing for trade with other home and foreign lines should be calculated with a near approach to certainty. The main complaint of large shipowners with regard to the Port of London is that such despatch and punctuality are not easy to reckon on. This is due to the state of the river channel, which we have previously dealt with, and also to the conditions prevailing in the docks. The modern practice of discharging most of the cargo on to the quay upon overside conditions which we have described, has largely diminished the delays, but, in the case of the Peninsular and Oriental Company at any rate, the insufficiency of space in the sorting sheds has made it impossible to deal with all cargo in this way. Special arrangements in loading vessels have to be made with great trouble in Eastern ports, so that part of the cargo may be discharged overside into barges. In the opinion of Sir Thomas Sutherland "the dock sheds are entirely inadequate to the system which ought to exist, namely, a system of 10574 Sutherland, 1951 Sutherland, 2001 1983.

<sup>1</sup> W. M. Smith, 2466; Hart-Davis, 2566-70; Moore, 2772-90; Humphery, 2897.

<sup>2</sup> See Sutherland, 1972; Anderson, 2097; Brightman, 224; Hill, 2384.

1997. "complete discharge of the ship to the shore." The same witness said, "Shipowners ought to be able to discharge as at Liverpool and all great ports on to the quay, and subsequent handling of goods should be at the cost of consignees, but in the present state of plant and sheds this cannot be done."

201. The complaints of the shipowners may be summed up under the following heads, viz:—

10568. 1. The inadequacy of the existing quay and berth accommodation for ships, and, in some cases, of entrance locks and depth of water in the docks, to meet the increased and increasing dimensions of modern steamships. They think that, in the words of Sir Edwyn Dawes, there should be "another large and commodious deep water dock, provided with all modern appliances for rapid discharging and loading."
- Dawes, 10571-73. 2. The inadequacy of the existing quay space and sorting sheds to receive the increasing bulk of modern cargoes, and to give facilities for their rapid sorting and delivery. It is urged that there is special need for accommodation for refrigerated produce, a new and large branch of trade.
3. The want of easy access to the quays for barges, resulting in delays in the clearing of cargoes.
4. The consequent congestion of the docks caused by barges floating about while they await means to approach, and getting in the way of the movements of ships.
5. The insufficiency of graving docks, and the inadequacy of dock plant, of cranes, tugs, etc.

2188. 202. The views of Sir Thomas Sutherland and Sir Edwyn Dawes were supported by other witnesses representing large ship owning companies, such as Mr. A. S. Williams, representing the General Shipowners' Society, who said that immediate dock extensions were needed both at the Albert Dock and at Tilbury, Mr. J. G. Anderson, the Manager of the Orient Steam Navigation Company, Mr. Edward Pembroke, the Chairman of the Shaw Savill and Albion Shipping Company, and Sir Alfred Jones, of Elder, Dempster and Company. All these witnesses were agreed as to the insufficiency of present dock accommodation to meet the requirements of modern trade.

2077, etc. 8325 In illustration of the way in which the general condition of the Port of London enhances the cost to shipowners, we may refer to some figures put in by Mr. Pembroke as to the relative time and cost of discharging ships of the same class at London and in Liverpool. In one case which he quoted, the same ship came from Rangoon with the same kind of cargo on one voyage to London and on another to Liverpool. At Liverpool she discharged 500 more tons than at London in two days less time, and the expenses were £367 0s. 6d. less. Other cases which he quoted gave results, in a less degree, of the same kind.

App. p. 654. App., pp. 376-7. 4836 Sir Alfred Jones, who has experience of the Ports of London, Liverpool and Bristol, put in figures to support his statement that "While London costs about the same as Liverpool and Avonmouth, the despatch is about five times as bad in the case of a large vessel in London."

#### COMPLAINTS OF CONSIGNEES.

203. The main complaint of merchants with regard to the docks in the Port of London is that long delays frequently occur after the arrival of a ship before they can obtain delivery of goods, and that they are put to expense in payments, which under a better system would not be necessary, in consequence of barges having to wait, sometimes for several days, before they can receive the goods.

204. The practice was clearly and concisely explained in a statement made by Mr. T. Hardy, one of the Managers of the London and India Docks Company.

"With regard to the manipulation overside "of goods in the Port of 6905.  
 "London, the ship owner's contract, in the absence of anything to the  
 "contrary in his bill of lading, does not end until actual delivery has been  
 "taken by or on behalf of the consignee. The consignee has, by the practice  
 "of the Port, the privilege of taking delivery by lighter direct from the ship's  
 "side, in which case he pays no dock dues, or if the shipowner, for his  
 "own convenience, lands and sorts the goods on the quay, the consignee  
 "can claim delivery of them from the quay into craft exactly as if the quay  
 "were part of the deck of the ship. If, however, the consignee is not in  
 "attendance with his lighter and all clearing documents within the time  
 "limited by the bill of lading, not exceeding in any case 72 hours after  
 "the ship's report, the shipowner is entitled to land these goods on the quay,  
 "and so subject them to dock charges, in which case the shipowner's  
 "liability ends there. There is no limit of time within which over side  
 "goods have to be removed from the quays, though theoretically the  
 "process of delivering such goods should be continuous and simultaneous  
 "with the discharge."

205. It has already been explained that under the modern practice the large Par. 172.  
 liners discharge the greater part and often the whole of their cargo on to  
 the quay on these "overside conditions." At this point arises the delay  
 which affects the consignee, and the reason of it cannot better be stated than  
 in the following further passage from the evidence by Mr. Hardy:— 6905.

"The delay against which there is so great an outcry is due simply and  
 "solely to the lighterage system. While the ship is alongside the quay the  
 "barges cannot in many cases obtain a berth, and even where a berth  
 "can be provided there is a certain amount of confusion in cross-trucking,  
 "first from the ship into the shed, and then from the shed to lighters.  
 "On an average, and with respect to large ships, it may be said that it takes  
 "18 days from the date of the ship breaking bulk before a shed is cleared of  
 "the cargo."

206. It was stated by other witnesses that, when the docks are full of  
 shipping, as soon as one vessel has cleared another comes in to take the  
 vacant berth. The lighters waiting to come alongside the quay to take the  
 cargo of the first vessel, then have to wait till its successor has also  
 discharged her cargo. As one witness said, speaking of the Albert Dock.  
 "When there is a large ship discharging, there is no berth for the Humphery, 2897  
 "barge to load in; she may poke her head in, but she cannot get  
 "to do very much until the ship is discharged. Then another ship comes  
 "alongside, and there again you have to wait for your goods." Meanwhile,  
 the quay and sheds become blocked with two or more cargoes, and the  
 difficulty of sorting is increased.<sup>1</sup> At the same time, it was alleged, a fleet  
 of barges, insufficiently manned, are floating obstructively about the  
 docks, while consignees have to pay their owners for the hours or days thus  
 idly spent, and have, moreover, the vexation of not being able to reckon  
 with any certainty upon the time of arrival of goods at their warehouses.  
 One witness, in the timber trade, said that his firm "frequently find it  
 "less expensive to take delivery by land carriage, and pay the dock

<sup>1</sup> Compare Hart-Davis (2594): "For instance, I will take a ship that goes, say, into the  
 "Albert Dock; she has a berth there, and all the cargo, if it is a mixed cargo, is put upon the  
 "quay. My lighters are down there waiting for an opportunity, as soon as the ship clears out, to  
 "get alongside and take the goods away. I secure a good berth; the moment that berth  
 "is secured, perhaps, and probably, a dock authority comes up and says; 'You must clear out of  
 "this,' because another ship is coming into the same berth. The other ship comes into the same  
 "berth, and my lighters have to clear out. Then a fresh consignment of goods out of the new  
 "ship is begun to be landed; there is a great deal of confusion, and a great deal of money  
 "lost, and a great deal of time lost, and eventually the goods have to be trucked a very consider-  
 "able distance along the quay, at the cost of the dock company, to my lighters. On some  
 "occasions I have had to wait two or three days before I could get my goods that were lying  
 "on the quay. It has always appeared to me that what you require for a trade such as London  
 "trade is, is a side canal about 4 ft. wide and, say, 8 ft. to 9 ft. deep on the other side of the  
 "shed or quay."

“company’s quay rate, or to store in the dock company’s warehouses and  
“pay the dock company’s heavy consolidated rate, rather than to pay a long  
“bill for demurrage on craft.”<sup>1</sup>

207. We also received evidence as to the delays in delivery of the goods, and as to the causes of such delays, from witnesses who represented many trades, such as the trades in fruit, dried fruit, frozen meat, wool, timber, flour, corn and chemical materials, and who spoke both for themselves and for trade associations<sup>2</sup>. The views of merchants and wharfingers as to the cause of the delays in delivery of goods were corroborated by the evidence of the shipowners<sup>3</sup>.

208. It was suggested by some witnesses that the difficulty would be met by the construction of jetties running out into the river or into the docks, as some do in the Victoria Dock, so that vessels could discharge on one side of the jetty while barges loaded on the other.<sup>4</sup> Other witnesses suggested the construction of barge canals running on the other side of the sorting sheds, parallel to the lines of quays<sup>5</sup>. It was also suggested that dock appliances should be improved<sup>6</sup>, that two-storied sheds should be constructed, that the roads giving access to the docks should be made better<sup>7</sup>, and that dock labour should be better organised.<sup>8</sup> Other witnesses again thought that the true means of enabling rapid discharge and delivery of goods was the construction of new docks<sup>9</sup>, or deep water quays along the river, where large ships might lie, as at Antwerp<sup>10</sup>. This last scheme was advocated by two representatives of large shipping companies, Sir Thomas Sutherland, and Mr. Becket Hill, and by the representative of the “Short Sea Traders’ Association.” It is very questionable, however, how far the available riparian land, within a convenient distance of London, would go to meet the demand for further wharf accommodation, while, further, it should be borne in mind that in a river with a tidal range such as the Thames the rise and fall of the water would entail much inconvenience and expense to large ships.

209. The body of testimony as to the delays in the delivery of goods from the docks and the injury suffered in consequence by the trade of London is overwhelming. The conditions of modern trade and industry, and the increase of railway facilities in various parts of the world, have enabled enormous cargoes to be brought together and shipped for London. Mechanical invention and enterprise have provided ships equal to carrying these cargoes; and the immense growth in population and wealth of London and the country round it have afforded a market sufficient to attract and absorb them.

The dock companies, however, for financial reasons which we have indicated, have not been able to adapt their receptive powers fully to the change of circumstances.

<sup>1</sup> Cobbett, 9229. Evidence as to the delays was also given by the following wharfingers:—Coombe, 2891; Hart-Davis, 2594; Humphery, 2929; Tait Moore, 2734, 2767; Smith, 2466, 2483-9; Weber, 2941.

## COMPLAINTS AS TO DOCK DUES ON GOODS.

211. We were directed by the terms of our reference to inquire into the system of charge for the accommodation of vessels in the Port of London, but were not instructed to inquire into the system of charges upon goods; still less, into the amounts of such charges. We did not refuse to hear evidence as to the general system of charging upon goods made by the dock company or to listen to statements made by traders that the rates levied affected their trades adversely. But we declined to enter into questions whether particular rates charged by the companies, acting within their statutory powers, were or were not reasonable.

212. The question of the dues charged by the dock companies upon the goods which pass through their hands does not concern all traders equally. It has been shown that three fourths of the goods which enter the docks are delivered upon overside conditions, either directly into barges, or through the temporary use of quays rented for the purpose, and on these goods no dues are paid to the dock companies. It is, however, alleged by some witnesses that although it would be more convenient for them to take away the goods by land they are deterred from so doing by the heaviness of the dock company rates<sup>1</sup>. It was contended that if low quay rates were charged upon goods which were passed through the docks to land conveyance, more goods would ~~so~~ be taken, and that the revenue of the company would in the end benefit<sup>2</sup>.

213. Mr. J. I. Rogers maintained that "the root idea of the dock arrangements in London is that goods have to be landed in a public warehouse and housed there. With this view a consolidated rate is charged, which most goods have to pay directly they are landed on the quays," and he alleged that "this consolidated rate includes a number of services which are not required in a vast number of instances."<sup>3</sup> Mr. Smith, in the dried fruit trade, said that "for goods that are taken away from the dock quay as quickly as possible the dock charges are on the same scale as if the goods were warehoused."<sup>4</sup>

"In London," said Mr. Tasker, of the flour trade, "you pay the quay rate and get nothing for it, you simply have to wait, get your flour when they please to let you have it, and if you want it weighed, sorted, classified, &c., you have to pay the full landing, storage and delivery rates."<sup>5</sup>

It was alleged by a witness in the paper trade that "except for very small parcels the dock company's quay rates are prohibitive."<sup>6</sup>

Complaints that their trades were adversely affected by system of charges were also made by representatives of the trades in wool, jute, timber, grain and flour, leather and hides, wines and spirits, cotton, coffee, and other commodities.<sup>7</sup>

It must be understood that we did not invite rebutting evidence, and that we do not express any opinion upon this subject.

214. It is difficult to make a general comparison between London and other ports with regard to relative dearness or cheapness, because the cost at London varies much with the methods employed. To a consignee who takes goods overside, or on overside conditions, and conveys them to his private warehouse on the river, London is a free port with respect to dues upon goods, so far as he is concerned, and the sole expense is that of lighterage. If, on the other hand, goods are landed in the docks, and are stored in the dock warehouses, or taken away by land, they are subject to the consolidated rate.

If, again, the goods are delivered overside into barges, or via the quays upon overside conditions, and taken to public wharfingers, the consignees

<sup>7</sup> Blackburn, 8882; Daniels, 8894; Falconer, 9378; Farquharson, 9690; Leary, 9195; Garratt, 10055; Kingsford, 10077; Roffey, 10019; Powell, 9526; Whelon, 10403; Rouse, 9597; and see comparative figures put in by Mr. Rogers, App. p. 85.

have to pay for lighterage and wharfage. It is alleged that the charges of the public wharfingers are based upon those of the dock companies, with a deduction, and that in many cases there is a working agreement or understanding between the companies and the wharfingers, so that the merchant who takes his goods through the wharfingers pays little less than if he had taken them through the docks.<sup>1</sup> It was stated by the Chairman of the London and India Docks Company that these agreements to fix minimum charges were only in certain trades, and would not prevent competition because there were "a great many people outside the agreements." In the case of tea, he said that the agreements would "practically prevent competition," but that the system suited the convenience of the buyers. Mr. Scott described the wharfingers as being "very friendly competitors to the dock "companies." It was alleged, however, by representative merchants that the destruction of warehouse competition by these agreements extended to other trades and was injurious to the interests of merchants and consequently to the trade of the Port.

#### GENERAL OBSERVATIONS.

215. It is, we think, desirable at this point to observe that while, so far as was shown by the evidence before us referring to them, other leading ports in the United Kingdom, and also some foreign ports, appear to be conducted to the satisfaction, upon the whole, of those who transact business in them, there appears, on the contrary, to be dissatisfaction with the Port of London, for one reason or another, on the part of all concerned with it, whether shipowners or merchants.

The question relating to the docks is so important that we desire, before proceeding, broadly to summarise the position. For a period of an hundred years the Dock Companies have carried on their business under the condition of the "free water clause," which they have endeavoured without success to induce Parliament substantially to alter. During that period other river interests of importance have grown and developed upon the basis of the same condition, so that London has become a port largely dependent upon the enterprise which has constructed private wharves and warehouses fed by barges. The free water clause has operated detrimentally to the Dock Companies, but, (even assuming that in all their administrative policy the Companies have been blameless) the great proportion of the misfortunes which have befallen them must be attributed to trade and fiscal changes for which the other river interests are in no sense responsible. The financial difficulties of the Dock Companies have prevented them from bringing their docks up to the level of modern requirements. It is admitted on all sides that some remedy should be applied to a state of affairs disastrous to the port, but it is a matter of debate what that remedy should be.

On the one hand the Dock Companies suggest the repeal of the free water clause, a measure which, though perhaps not unjust in itself, would disturb the business organisation of the river which has been evolved by the experience of an hundred years. On the other hand, it was in effect contended that, in principle, commercial misfortunes should lie where they have fallen; that great river interests which have not been unfortunate should not be disturbed in order to assist those which have been; and that the vital need for financial strength would be better secured by the creation of a new body responsible to the public, than by strengthening, as against other interests, companies responsible to shareholders.

## PART IV.

---

- 1.—Constitution and expenditure, of Governing Bodies in other British Ports.
  - 2.—Administration and public expenditure in certain foreign Ports.
  - 3.—Proposals made to the Commission with regard to the reform of the Port of London.
- 
-

## CONSTITUTION AND EXPENDITURE OF GOVERNING BODIES IN OTHER BRITISH PORTS.

216. We collected through questions in writing and oral evidence much information as to the history, present constitutions, functions, sources of revenue (and expenditure) of the Port Authorities now existing in the principal Ports of the United Kingdom.<sup>1</sup> This information will be found in full detail in the volume of Evidence and Appendices. It will be sufficient that we should here direct attention to a few leading features.

217. In early days the control of Ports in this country seems to have been usually exercised by the municipal authorities. This management does not appear to have been found adequate to meet the increasing requirements of trade and shipping, for by a number of Acts of Parliament, passed for the most part within the last half century, special Port Authorities charged with the government of the Port have been created in all the more important maritime cities of the United Kingdom. Bristol is the chief port in which the Corporation as a whole continues to be the Port Authority.

The type of Port Authority most opposite in its constitution to that of Bristol is that existing at Liverpool. The Mersey Docks and Harbour Board at Liverpool contains no member, either *ex-officio*, or nominated, who directly represents the municipal authority of the City. This entire exclusion of the municipal representation seems to occur in no other place of importance where a public Port Authority exists.

At Belfast, it is true, such representation of the municipality is limited to the Lord Mayor of the City, who is *ex-officio* one of the Harbour Commissioners, but the ordinary ratepayers have a share in the election of the Port Authority.

In the largest class of cases, containing the largest number of important ports, the constitution of the governing body is a compromise between the entirely municipal character of that at Bristol, and the entirely non-municipal character of that at Liverpool. As a rule the Port Authority contains, in various proportions, members who are *ex-officio*, or by nomination, representative of the municipality, and members who are elected by payers of dues on shipping and goods, together, sometimes, with persons nominated by Government departments or other authorities.

Another important group of ports are controlled, or chiefly controlled, by railway companies, dock companies, or private owners.

218. In order to illustrate more in detail the leading types of governing bodies we may summarise the constitutions of those at Liverpool, Belfast, Glasgow and the Tyne.

At the first-named city the Mersey Docks and Harbour Board was created by an Act passed in the year 1857. It consists of 28 members renewed by rotation, of whom four are nominated by the Conservancy Commission of the River Mersey, who are the First Lord of the Admiralty, the President of the Board of Trade, and the Chancellor of the Duchy of Lancaster. The other 24 members of the Board are elected by persons who have paid not less than £10 in dock rates during any year. We were informed that, in practice, various interests combine to obtain a certain number of representatives on the Board, so that the elected members mainly represent the Steamship Owners' Association, the Ship-owners' Association, the General Brokers' Association, the Cotton Association, the Corn Association, and so forth.

Burton, 4479-4562.

4564.

At Belfast the Harbour Commissioners consist of the Lord Mayor of Belfast and twenty-one members (one-third of whom retire annually), elected by the shipowners and the ordinary ratepayers, upon a system of plural voting according to tonnage or rateable value.

App., p. 856.

<sup>1</sup> Burton 4477-679 and 4700-4703; Girdlestone 4680-99; 4704-822; Mackenzie 5006-128; Unwin 5343-416; Dixon 5417-458 and App. pages 855, 864, 876, 879, 893, 901, 913, 931, and 942.

**Mackenzie, 5009.** At Glasgow, the Clyde Navigation Trust was constituted by an Act of 1858. This body consists of twenty-five members, viz., the Lord Provost of Glasgow, *ex-officio* Chairman, nine Town Councillors of Glasgow, two nominees of the Chamber of Commerce, two of the Merchants House, and two of the Trade House, and nine persons elected by the shipowners and harbour ratepayers.<sup>1</sup>

**Urwin, 5346, and App., p. 914.** The constitution of the Board of Tyne Improvement Commissioners was brought to its present condition by various Acts passed between 1850 and 1898. The most important alteration was effected in 1898, after much discussion in Parliament, when the number of elected members was increased from six to fifteen. The Commission now consists of thirty-two members, of whom seventeen are nominated, and fifteen are elected. Six are nominated by the Newcastle Town Council, two by that of Gateshead, one by that of Jarrow, three by that of Tynemouth, three by the Improvement Commissioners of South Shields, and two (for life) by the Board of Trade. Fifteen members are elected by the shipowners, the coalowners and the traders of the Tyne, each group electing five members. Under the provisions of the constituting Acts, persons, firms and companies who form the electoral units can each claim a number of votes, varying, as the case may be, with the shipping tonnage, coal shipped, or amounts of dues paid on goods.

**App. p. 943.** 219. The evidence shows that as a rule in the large ports of the United Kingdom the wet docks were either constructed in the first instance by companies and have subsequently passed into the hands of the Port Authorities, or have been constructed by those Authorities. In some places, however, certain docks remain in private hands by the side of others which belong to the Authority. This is, for instance, the case on the Tyne, where one of the three wet docks belongs to the North Eastern Railway Company, while the other two belong to the Tyne Improvement Commissioners.

**Burton, 4479.** 220. Liverpool presents an interesting example of the consolidation under a single Authority of docks constructed and held by different bodies. In addition to the Liverpool Dock which had belonged to the City Corporation since the beginning of the eighteenth century, there were in 1855 two other docks at Birkenhead, one belonging to a body called the Birkenhead Dock Commission, the other to a dock company. An agreement was made in 1855 for the transfer of both these docks at Birkenhead to the Liverpool Corporation. In 1857 the whole matter was considered by a Select Committee of Parliament. In accordance with their recommendation an Act was passed by Parliament in the same year contrary to the proposals of the Liverpool Corporation, but in conformity with those made by the Manchester Chamber of Commerce, the Manchester Commercial Association, and the Great Western Railway Company, who desired that the Mersey River and docks should not be controlled by the Corporation. **Burton, 4568—4588.** This Act created the Mersey Docks and Harbour Board in the entirely non-municipal form to which we have called attention, and vested in it from the 1st January, 1858, all these docks at Liverpool and Birkenhead, together with all the powers over the port then belonging to the Corporation, including those of fixing and collecting town and dock dues. **4479**

There are, however, certain other docks, such as the important railway dock at Garston, belonging to the London and North Western Railway Company, and some other smaller docks upon the Mersey. That river also furnishes the access to the Manchester Ship Canal and Docks. The general maintenance and control of the Mersey is in the hands of the Mersey Conservancy Board, the acting conservator on which is appointed by the Board of Trade.

**Burton, 4498—501.** 221. Comparisons were frequently made by witnesses, especially by shipowners, between the whole port system of London and that of Liverpool, and almost always to the advantage of the latter port. But it must be remembered that the Mersey is not lined, as the Thames is for miles, by

(<sup>1</sup>) A Bill was introduced in 1901 to modify the present constitution of the Clyde Trust by diminishing the proportion of municipal representation.

public and private wharves, and that the delays and difficulties due to the large use of lighters have not arisen there. The chief advantages of the Port of Liverpool, in addition to its near access to the sea are (1) That all the docks being under a single authority the destination and berthing of incoming vessels can be organised on a systematic method (2) that the custom by which when the shipowner has discharged his goods on the quays his responsibility ends is convenient for him, and (3) that as all goods landed pay dues on a uniform scale, whether they are afterwards removed from the quays by land or by water, no bounty is placed, as in London, upon one mode of removing them, with the result of congestion in one direction and slack business in another. Burton, 4485.

222. The duties of maintaining and deepening channels and of regulating traffic within the limits of the Port, are usually in ports where a central Authority exists discharged by that Authority. Buoying is also usually in the hands of the Authority, and in some cases, such as Liverpool and Belfast, the superintendence of pilotage within the limits of its jurisdiction. On the Clyde and the Tyne pilotage is, however, controlled by a special statutory Board. Eight out of sixteen members of the Clyde Pilot Board are chosen by the Clyde Trustees, and two out of the seventeen members of the Tyne Pilotage Board are chosen by the Tyne Commissioners. At Southampton, also, and at Cardiff, pilotage is controlled by a special Board of Commissioners. App. pp. 856 and 919,  
App. pp. 881 and 945.  
Dixon 5420.

223. The revenue of the Port Authority in the chief Ports of the United Kingdom is mainly derived from two sources—tonnage dues on ships and dues on goods. This is, for instance, the case at Liverpool, Glasgow, the Tyne, Bristol, Belfast, and Hull.<sup>1</sup> The general rule is that dues upon ships are paid by the owners, dues upon goods by the consignees; sometimes, however, as on the Clyde and at Hull, arrangements are made for convenience that the direct payers of dues upon goods shall be the shipowners. App. p. 888.  
App. p. 908.

In the case of Liverpool, Glasgow, the Tyne, and Bristol, we have made inquiries as to the exact process by which dues upon goods are collected, whether there has been found to be much difficulty or expense about the process, and whether dues are collected upon all goods, or whether any classes of goods are exempted. We print as an appendix the answers which we have received to these inquiries.

224. We have also inquired into the expenditure of the Port Authorities at the leading Ports.

At Liverpool, the Mersey Docks and Harbour Board have spent upon new works and improvements, from their constitution as Port Authority in the year 1857 to the 1st July, 1901, the sum of £19,371,598 raised under their borrowing powers, and the sum of £2,200,000 out of the revenue, or a total sum of £21,571,598.<sup>2</sup>

The expenditure during this period of 44 years was very much larger than the whole expenditure of this kind since the first Liverpool Dock Act was passed in the year 1709 to the year 1857.

We are informed that the total average annual cost upon dredging of all kinds, out of both capital and revenue (including cost of vessels insurance and depreciation) for the ten years ending 1st July, 1901, may be taken approximately at £125,000.<sup>3</sup>

The expenditure has been highly beneficial to the port, and notwithstanding the heavy debt charge the Liverpool Authority appears to be in a very satisfactory financial condition. They have been able in recent years to make considerable reductions in dues, both on ships and goods. Burton, 4653-61.

225. At Bristol the total capital expenditure upon the Dock Estate before it was taken over in 1848 by the Corporation was £424,781. Since that

<sup>1</sup> App. pp. 859, 873, 888, 908, 926, 949.

<sup>2</sup> The sum of £23,947,842 mentioned by Mr. Burton at answer 4628 as the total amount expended at Liverpool represents the total capital expenditure on the Liverpool and Birkenhead Docks Estate by the Mersey Docks and Harbour Board and their predecessors under borrowing powers, exclusive of works paid out of revenue from the year 1709 to the year 1900 together with sinking fund and unappropriated revenue also so invested in works. See correspondence printed as Appendix E to this Report page 187, *post*.

<sup>3</sup> See letter dated May 6th, 1902, in Appendix E, page 187, *post*.

date the Corporation have spent upon the City docks and river improvements a further sum of £1,016,164. In the year 1884 the Corporation purchased at a cost of £821,043 the Avonmouth and Portishead Docks, and have since that date up to the 31st December, 1901, spent upon those docks a capital sum of £375,913. In addition to the capital expenditure on these purposes provided for out of borrowed money, the Corporation have spent upon their works nearly £500,000 out of ordinary revenue.

The average annual cost of dredging, met partly out of capital and partly out of revenue, for the ten years ended 31st December, 1901, has been £10,600.<sup>1</sup>

Girdlestone 4792. We were informed in evidence that the Corporation have decided "to embark upon a further capital expenditure of nearly £2,000,000." This includes the cost of a new dock at Avonmouth, the construction of which has been recently commenced.

Urwin, 5415-6. The Tyne Improvement Commissioners had expended up to the 1st April, 1901, a sum of £5,733,251, met to the extent of £1,581,768 out of surplus revenue, and as to the residue out of borrowed money.

During the ten years ending 31st December, 1901, the average annual cost of dredging met partly out of capital and partly out of revenue was £48,541 in respect of the river Tyne, and £1,504 in respect of the docks and at the river staiths.<sup>2</sup>

Mackenzie, 5108. The total expenditure by the Clyde Navigation Trust upon new works and improvements of a permanent character to the beginning of the year 1901 was stated to be £7,430,702.<sup>3</sup>

The average annual cost of dredging met partly from capital and partly from revenue for the ten years ending 30th June, 1901, has been £45,286.<sup>4</sup>

#### ADMINISTRATION AND PUBLIC EXPENDITURE IN CERTAIN FOREIGN PORTS.

Gomme, 7789

226. We made inquiries through Your Majesty's Consuls into the conditions existing in Germany, Holland, Belgium, and northern France. In all these ports the waterways, docks and quays belong to, and are controlled by the national or local public authorities.

We may quote, in this connection, part of a reply made by M. Royers, Chief Engineer of Public Works at Antwerp, to an inquiry made (among others) in 1895 by the United States Consul, by the direction of the State Department at Washington. This inquiry was made at the instance of a State Board appointed by the Commonwealth of Massachusetts, the results of whose investigations are contained in an interesting report on "Docks and terminal facilities" made in 1897. M. Royers wrote:—

Page 154 of the Report.

"So far as I know, private ownership does not exist on the Continent in regard to wharves, quays, &c.; these are held by the authorities for the benefit of the public. The coast line, the navigable streams and rivers, all belong to the Government, and are under its control. Permission is never accorded to private firms or to public companies to exploit these for their own particular ends or benefit. In all such matters public utility and public convenience alone are taken into consideration. Not only is a navigable river nearly always appropriated to the public service, but the bank, or towing path, is likewise regarded as being Government property. Therefore, speaking generally, it may be said that private ownership does not exist here, either in regard to the stream itself or to

<sup>1</sup> These facts are stated in a letter addressed by Mr. Girdlestone to the Secretary of the Commission dated 27th March, 1902, supplementing his evidence 4722 et seq.

<sup>2</sup> Stated in a letter addressed by Mr. Urwin to the Secretary of the Commission dated 30th April, 1902.

<sup>3</sup> In a letter to the Secretary of the Commission dated 16th April, 1902, Mr. Mackenzie stated that the total capital expenditure down to the 30th June, 1901 was, in "round figures about £7,500,000," of which about £5,500,000 has been applied to the Harbour and Docks of Glasgow, and the remaining £2,000,000 to the improvement of the river.

<sup>4</sup> Stated in a letter addressed to the Secretary of the Commission by Mr. Mackenzie dated 28th April, 1902.

"the land immediately adjacent thereto. For the same reason, private ownership in docks, wharves, quays, &c., here is unknown, and this could not be otherwise. It might happen that a concession for the appropriation of land, either riparian or on the sea coast, might be granted by the Government to individuals. But this is rarely the case; and, in fact, I know of none which have been important or which have met with success."

The State Board say in their Report: "Upon the Continent of Europe public ownership and control of docks and harbours is universal, with the exception of Copenhagen, where the free port is incorporated, and Marseilles, where the ownership of the docks is both public and private."

227. In Germany the sub-imperial States of Bremen and Hamburg administer their own ports. At Rotterdam and Antwerp the port is governed by the municipality, while at Havre, as at all French ports, the docks and quays are controlled and financed by a central State Department, with the assistance of the local Chamber of Commerce, and are served by Government officials, engineers and workmen.

In all these ports large sums of money have been spent in recent years upon deepening channels, construction of quays and docks, perfecting railway communication and otherwise improving the ports and making them formidable competitors for the trade of the world. Mr. Pogson, the British Vice-Consul at Hamburg, stated in his evidence that the total spent at Hamburg on the river channel, docks, quays, and other harbour works since 1888 amounts to about £15,000,000, contributed partly by the Hamburg State, and partly by the Imperial Government, that £5,700,000 had been spent at Bremen and Bremerhaven, and that the total expenditure of this kind at German ports since 1888 amounted to about 24½ millions. At Antwerp and Rotterdam, each the chief maritime outlet of a small but wealthy and energetic country, the national Government has co-operated very largely with the municipal in expenditure upon the Port. 5496-98.

The Massachusetts State Board say in their Report, the result of visits and inquiries: "The four continental ports of Havre, at the mouth of the River Seine, of Antwerp, 59 miles up the Scheldt, of Hamburg, 70 miles up the Elbe, and of Rotterdam, on the new Maas, being the main outlet of the Rhine, 18 miles from its mouth, are all great cities and commercial entrepôts, whose present growth and importance have been largely achieved within the century. They are all connected by systems of waterways with the far interior of Europe, and are great distributing centres, where merchandise changes bulk in transportation to ultimate destination; and all are natural terminals, where barge or river navigation ends and ocean carriage begins. Page 51 of the Report.

"At each city are to be found magnificent and costly systems of docks, piers, anchorages, and waterways, under public ownership and control, possessing every facility for carrying immense trade by means of commodious and convenient warehouses, with modern appliances, operated by steam, water or electricity; and all are designed to promote economy and speed in handling at low, uniform and unvarying rates of charge."

228. In addition to the information which we received from Your Majesty's Consuls, evidence was put before us by Mr. Gomme, the Clerk to the London County Council, with regard to the German, Dutch, Belgian and Northern French ports, based on much information which he had collected from official documents and from personal visits and inquiries. The results of his investigations were summarised by him as follows:— Gomme, 7769-7785.

"(1) That with few exceptions the accommodation for shipping has been provided within the last 40 years, and for the most part within the last 30 years. Bremerhaven, Amsterdam and Rotterdam are the chief exceptions, the rule applying to all the others, and, of course to these ports in great measure as well. (2) That great natural difficulties have had in all cases to be overcome, and that a large part of the energies of the responsible authorities has been devoted to the carrying out of extensive and costly works for the removal of these natural difficulties. It is only necessary 7784.

"to mention the following: The shallow state of the Elbe to Hamburg, "necessitating a large scheme of dredging; the shallow state of the Weser "to Bremen, necessitating a large scheme of dredging; the long and "shallow approach to Amsterdam by either the Zuyder Zee or the "North Holland Canal, necessitating the cutting of the North Sea Canal; "the difficult and tedious approach by the Brielle to Rotterdam, necessi- "tating the cutting of the Hook of Holland Canal; the accumulation of "sandbanks in the Scheldt, necessitating extensive rectification of the "river banks to facilitate the approach to Antwerp; the depth of the "harbour and approaches at Dunkirk, Calais, Boulogne, and Cherbourg, "necessitating extensive dredging; the condition of the Seine, necessita- "ting continuous dredging and extensive dyking in the interests of the ports "of Havre and Rouen. (3) That when many of these extensive schemes "of improvement were undertaken the shipping was of comparatively small "dimensions in view of the cost of the improvements proposed. (4) That "accommodation has been provided to a great extent with a view of "inviting fresh trade rather than of accommodating existing trade. (5) That "the anticipations as to increase of shipping with which improvements have "been undertaken have on the whole been fulfilled. (6) That the principle "of providing for ships of the greatest draught from time to time appears "to have been kept steadily in view."

7789. 229. Mr. Gomme also put in tables with reference to the cost of foreign ports, as compared with that of London. Summarising the broad results he considered that the ports fall into three groups, viz.:

"(1) The ports of Amsterdam, Rotterdam, and Antwerp, where the "charges are exceedingly low, partly owing to the fact that the Imperial "Government in each case has largely contributed to the cost of improve- "ments, and has foregone all imperial dues, and to the fact that the "municipality, acting as the port authority, has made it its object to keep "the charges on shipping at the lowest point. (2) The ports of Hamburg "and Bremen-Bremerhaven, where the Imperial Government has not come "to any great extent to the aid of the municipality in meeting the cost of the "extensive improvements that have been carried out. The port of Hamburg "levies a considerable tax on the shipowner in the shape of a quay due "to meet the cost of the improvements, whereas the State of Bremen levies "a tax on the goods, which accounts for the difference in the charges on "the ship-owner at the two ports. (3) The French ports, where both the "Imperial Government and the local authorities levy very considerable "dues on the shipowner to meet the cost of the extensive improvements "that have been carried out. This comparison, so far as it goes, can be "made with almost absolute certainty."

230. Mr. Gomme also supplied us with figures relating to the relative cost of pilotage at London and the foreign ports, and of that great element in the relative expense of ports, the cost of labour. Figures were also put in by Sir Alfred Jones as to comparative cost in connection with dues and labour, and time occupied in discharging cargo at the Ports of London, Hamburg, Rotterdam, Antwerp and Bremerhaven.

231. Taking together the figures supplied by Mr. Gomme and the evidence given by other witnesses, we conclude that for ships which use the docks—that is, for all large ships—London is a much dearer port, both as regards out-payments and as regards delays, than Amsterdam, Rotterdam, and Antwerp, and that, for those goods which pass through the docks, it is, taking together dues on goods and ships, cost of labour and pilotage, a somewhat more expensive port, as regards out-payments, than Hamburg, and not nearly so well organised.

It appears that at Hamburg the port is not worked at a profit, and that the expenditure exceeds the receipts. The State Government, however, consider that the benefit due to the influx of trade compensates the city for the specific loss, and they look to the future, encouraged by the enormous increase in shipping parallel to the increase in expenditure. The low cost of Rotterdam and Antwerp seems to be partly due to the cheapness of labour, but also to the deliberate policy of the Dutch and Belgian Govern-

7792 and  
App. p. 613.

4831 and  
App., p. 376-77.

Pogson, 5495-97.

ments, who are closely competing for the trade of the Low Countries, and of that great and flourishing region from which goods come down to the coast by the River Rhine and by the German State Railways.

232. The power of undertaking large present expenditure, and of working for a long time at a loss with a view to compensation in a distant future, is no doubt, in the keen world-competition, an advantage possessed by undertakings which have the force of an empire, state, or great city behind them. If, in some countries, national and municipal resources are thus employed, it becomes most difficult for private enterprise elsewhere to hold its own against the intelligent, farsighted, and formidable rivalry thus created.

## PROPOSALS MADE TO THE COMMISSIONERS WITH REGARD TO THE REFORM OF THE PORT OF LONDON.

### VIEWS OF THE SHIPOWNERS.

233. The shipowners trading to the Port of London fall into two main groups, (1) the "Short Sea Traders," whose ships pass to and fro between London and ports on the Continental or British coasts, either in regular services or otherwise, and (2) the owners of the large liners and cargo ships and "tramps," which ply between London and all parts of the world.

The total tonnage of the short sea traders is much less than that of the long traders, but in consequence of the more rapid returns of their ships to the Port they pay, it is stated, 50 per cent. of the river dues, as distinct from the dock dues. 3401.

234. The views of a large group of short sea traders were put before us by Mr. Cattarns, on behalf of the Short Sea Traders' Association, a body owning, at the date of his evidence, 202 ships, with a tonnage of 210,562 tons. This association desires the creation of a central authority "to take over the control and "administration of the Port of London," and to extend, improve, and add to the facilities of the Port. They are strongly adverse to the purchase of the docks by the authority, or to financial assistance to the dock companies, and think that the authority should chiefly devote itself to broadening the channel and deepening the bed of the river, embanking its sides, and providing deep water quays along it. They allege also that "it is essential "to the national interests and in the interests of the Port of London, as "the largest transshipping centre in the United Kingdom, that the taxation "of the Port should be kept to the lowest possible figure, having regard to "the competition of Continental ports, and that anything in the nature of "taxation on goods or a substantial tax on lighters would be detrimental "to the Port." 3527.

App. 355.  
3527.

235. The short sea traders strongly desire improvements in the river channel, but they seem to have no quarrel with the dock companies. Mr. Cattarns, who represented the Association, and also the important General Steam Navigation Company, of which for some years he was secretary and manager, said that in his opinion the difficulties in London had been exaggerated, and that there was not sufficient justification for complaint against the docks, although there was room for improvement in their appliances, and possibly in the arrangement of their quays and sheds. In point of charges he thought that the shipowners who used the London and St. Katharine Docks had "very fair and liberal arrangements with the dock "companies," and that the companies made "fair and just arrangements to "meet the needs of these smaller vessels." 3411.

Mr. Cattarns stated that the "charges which are made to the smaller "ships that come to the upper docks are less than the charges made for "the larger ships that go into the lower docks," and he added, "in point of "fact the upper docks are brought by the dock companies into competition "more or less with the wharves in the upper part of the river, for the "purpose of getting smaller vessels into those docks." 3436.

3481.

Mr. Cattarns believed that the "free quays" which he desired that the River Authorities should provide at a cost of about £1,000,000 along both sides of Long Reach, would not compete in a detrimental way with the docks and wharves of the Port, provided that no warehouses were built by the Authority along such quays. The short sea traders are in competition for transhipment business with the great and rising ports beyond the Channel, and therefore press strongly that no burden shall be laid upon goods in the Thames. They are willing that such increases should be placed upon existing sources of dock and river revenue as would provide funds for carrying out improvements.

3447-8.

It is right to bear in mind that the short sea traders do not use the docks so much as do the ocean traders, seeing that their vessels to a great extent load and unload in the stream, or at wharves. In the case of St. Katharine's Docks special rates are accorded to them by the dock company.

236. The owners of ocean ships approached the question from a different point of view. Looking at the whole system of the Port of London, and comparing it with other ports, the large shipowners find it inconvenient and expensive. The expense was represented by them to be due not so much to the direct dues on the shipping levied by the Thames Conservancy and the Docks, as to the delays caused by the inadequacy of the channel for large ships, the bad arrangements in the docks, and the inefficiency of labour. It must be observed that, since this evidence was taken, the London and India Dock Company have raised their dues on shipping by 50 per cent., to 1s. 6d. a ton, their legal maximum, and that shipowners giving evidence now would not improbably express stronger views on the subject of direct charges than they did a year ago. On the whole, however, the complaint of large ship-owning companies is, that in London they pay heavily in various ways and do not get good return in services for their money.

8331.

237. Mr. Pembroke, of the firm of Galbraith Pembroke and Co., and Chairman of the Shaw, Savill and Albion Shipping Company, remarked: "When I came to London 55 years ago, and for many years afterwards, London was the favourite port with all shipowners, and commanded tonnage at the lowest freights current; now, and for some time past, all owners of tramp steamers, unless they have full cargoes of grain in bulk, do what they can to avoid having their vessels at London, owing to the large expense and delay incurred there. In order to regain the popularity of the Port, I think it is very essential that a harbour trust, which should certainly include two or more experienced dock directors, should be promptly formed to have the entire control of the river below bridge, the docks, and, if possible, the wharves. The improvements required are on such a large scale, and so much money is indispensable, that the present system is altogether powerless to accomplish what is needed. More dock accommodation is imperative, and the river and docks must be adapted for large vessels. If quay space can be inaugurated satisfactorily down the river, it will, of course, relieve the docks to a certain extent, and be of much advantage."

8332.

He also said, after reviewing in detail the condition of the docks, "In the interest of the community the trade of the Port should be the first consideration, but shipping is hampered at every turn to the loss and detriment of shippers, consignees, manufacturers, and consumers, no less than of the shipowner. The defects are of a kind that would be speedily remedied by any corporation trust or public body, whose chief consideration is the best interest of the community, the Port, and the trade, and who are not fettered financially in the expenditure of money which may not yield an immediate revenue."

1988.

238. Sir Thomas Sutherland, chairman of the Peninsular and Oriental Company, said that he was in favour of "an entire change in the system of the Port," and added that "the present system of the Port of London is disgraceful for the nineteenth century." He maintained that "in the interests of public policy the administration of the Port of London and the docks should be in the hands of an authority constituted *ad hoc*, which should have powers not likely to be given either to the present Conservancy

"Board, or to the dock companies, to impose such dues either on ships, or river craft, or on goods, as would appear to be necessary for the purpose of raising a sufficient revenue for the improvement of the Port, and the extension of dock works, or construction of wharves, in whatever direction such improvement may be found necessary."

The revenue should, he thought, be raised from ships, dock dues, and goods. 2009.

He said that he knew that he expressed generally the feelings of the large companies regularly trading to the Port of London. His views were supported by Mr. W. Becket Hill, of the Allan Line. 2008. 2249, etc.

Sir Edwyn Dawes, speaking for the British India Company and the New Zealand Shipping Company, said: "We have always got on extremely well with the dock company, and if the dock company was supplying our wants we should be content. If the dock company is from any cause unable to do it, some other body must, if the Port of London is not to fall behind." 10602.

239. We gather from the evidence that the whole shipowning interest desire the constitution of a single authority controlling the river, and the expenditure of considerable sums in improving the channel, but that with regard to the transfer of the docks to such an authority, some division of opinion exists between the short sea traders and the ocean traders.

#### VIEW OF MERCHANTS WITH REGARD TO THE REFORM OF THE PORT OF LONDON.

240. Reference has already been made (paragraph 199) to the views upon this subject of the riverside interests and wharfingers. The majority of the witnesses who appeared before us to represent mercantile trade associations interested in the efficiency of the Port of London were in favour of the creation of a central Authority for the control of the river and docks. It is not necessary to refer specifically to definite suggestions made by these witnesses, as their views may, on the whole, be taken to be centralised and expressed by the London Chamber of Commerce.

We may, however, mention the suggestion made by one witness that the Authority should receive power to acquire, in addition to the Docks, all public wharves and other riverside property within a certain distance below London Bridge. This proposal did not appear to be suitable for our consideration.

Hart-Davis  
2580, 2594 and  
2664-91.

#### SCHEMES SUBMITTED BY THE LONDON CHAMBER OF COMMERCE, THE CITY CORPORATION, AND THE LONDON COUNTY COUNCIL.

241. We received evidence from representatives of the London Chamber of Commerce, the City Corporation, and the London County Council. These bodies agree in holding that a large reform in the system of the Port is necessary. They agree also in thinking that the control of the Port and river should be vested in a single authority, that the docks should be transferred to that authority, and that considerable sums should be spent by the authority in improving and extending the docks, and in widening and deepening the river approach. They agree in proposing that the authority should be constituted of representatives of national and municipal interests, together with representatives of the shipowners and traders using the Port. There are, however, differences of opinion as the precise way in which the authority should be constituted and as to the way in which its revenue should be provided.

#### SCHEME OF THE LONDON CHAMBER OF COMMERCE.

242. The scheme of the London Chamber of Commerce contemplates the formation of a "London Harbour Trust" having the sole control of the waters of the Thames from Richmond Lock to Yantlet Creek, and with power to dredge beyond Yantlet Creek, where necessary. The general object of the Trust is defined as being "to control the waters of the Port and the traffic thereon, so as to promote the trade and commerce of the

Rogers, 10133

Rogers, 10133.

"Port for the benefit thereof, and in the interest of the inhabitants of London, and not of any section thereof." It is proposed that the powers and duties of the existing river and dock authorities should be transferred to the Trust, including pilotage business.

The Chamber suggest that the Trust should be constituted of 49 members, as follows :—*Ex-officio* members : Corporation, six representatives ; London County Council, six representatives ; one representative of the Admiralty, and one of the War Office ; the Chancellor of the Exchequer ; one representative of the Board of Trade ; the chairman and secretary of His Majesty's Customs ; two representatives of the Thames Conservancy ; two representatives of the Trinity House ; two representatives of the London Chamber of Commerce ; twenty-five elected members, representing the shipowners, sailing-barge, and tug owners and lightermen, short sea traders, Lloyds, public and private wharfingers, and merchants and manufacturers landing goods in the Port.

The Chamber propose that the Trust shall possess the sole right to construct new docks in the Port, that it shall have power of compulsory purchase over riverside property, and that the whole property of all the existing docks shall pass to and become vested in it.

Rogers, 10133.

The Trust is, however, to sell or lease as soon as it can all "water basins, warehouses, sheds, cranes, locks, lighters," or other property that may not be required for the fulfilment of its duties as a Trust for the water area of the Port. The Trust is to be expressly forbidden to undertake such warehousing. The Chamber estimate the cost of the purchase of the water area and quays of the docks, after this sale has been effected, at £9,000,000 ; that of "modernising the docks" at £4,000,000 ; and that of deepening the river at £2,000,000.

The revenue of the Trust, in this scheme, is to be derived from the following sources, viz. :

- (1) The existing sources of revenue of the Thames Conservancy, the Watermen's Company, and the Dock Companies, with power to vary rates.
- (2) Dues upon all goods landed within the jurisdiction of the Trust.

The Chamber of Commerce also suggests that the City Corporation or the London County Council should have power to levy rates to assist, if necessary, the Trust in maintaining or developing the Port, and that the interest upon the capital raised to buy the Docks, to improve them, and to deepen the river, should be guaranteed by the Corporation and (or) by the County Council.

#### SCHEME OF THE CITY CORPORATION.

Samuel, 7919.

243. The City Corporation propose the creation of a Port Authority with a jurisdiction extending from Richmond to a line drawn from the Naze to the North Foreland, to be called the "Thames River, Dock and Harbour Board." The Board is to control both the river and the docks. A special tribunal is also to be constituted, with powers like those of the Railway Commission, to whom may be submitted questions relating to rates and charges arising between persons using the Port and the new authority.

The Board is to consist of 40 members—viz., ten appointed by the Corporation of the City of London, two by the Admiralty, two by the Board of Trade, two by the Trinity House, two elected by the railway companies, two by the underwriters of Lloyds, and the remaining 20 by shipowners, merchants and others paying dues to the Board.

The Board are to have power "to purchase the property of the dock companies and such bonded wharves and warehouses as they may see fit, and to raise the capital necessary for that purpose and for the deepening of the channel of the river and "for the general improvement of the port and docks."

Samuel 7919,  
7922, 7929.

The Corporation propose that power should be given to the Board to "impose such taxes upon all goods entering or leaving the Port, and upon shipping, lighters, and barges using the river, as may be necessary or desirable to procure the income required to enable the necessary capital to be raised." They propose that the Imperial Government should guarantee the stock of the Board, and that it should be made a security in which a Trustee may invest under the Trustees Act, 1893.

## SCHEME OF THE LONDON COUNTY COUNCIL.

244. The London County Council propose that a new authority to be called the "Port of London Committee," should have jurisdiction over the tidal river from Teddington to a line between the Naze and the North Foreland, that to it should be transferred all the powers now exercised by the Thames Conservancy, City Corporation, Trinity House and the dock companies, and that it should take over the undertakings of the London and India, the Millwall, and the Surrey Commercial, Dock Companies. Wood, 7120.

The Council propose that the authority shall consist of not more than 30 members, of whom ten are to be appointed by the County Council, two by the City Corporation, ten to be representatives of the shipowners, merchants and others interested in the commerce of the Port, elected on the Liverpool system, by all who have paid in the preceding year £10 of port dues. The rest are to be appointed by various Government departments, such as the Board of Trade, the Customs, the Admiralty, and perhaps the Treasury.

The County Council propose that the capital necessary for the purchase of the docks and for improvements and extension of docks and river channel should be raised by themselves on behalf of the new port authority upon the security of the London rates. They suggest that in this case the Council should retain control over capital expenditure by the Port Committee, in order to "safeguard the interests of ratepayers." Wood, 7121, 7262-5.

The County Council do not, like the Chamber of Commerce and the City Corporation, propose that dues should be imposed upon all goods landed in the Port. They look for revenue to the present sources of income of the dock companies, Thames Conservancy, and other authorities to be absorbed, but propose that, if this income is not sufficient to meet the total current expenditure and debt charges, it should be supplemented by contributions from the London rates. They suggest also a contribution by the Imperial Government on the ground that "the trade of the capital is not only a matter of local but of national concern," and that it is threatened by the competition of foreign ports. 7120, 7177. Wood, 7120.

## OBSERVATION AS TO THE ABOVE PROPOSALS.

245. We do not intend to criticise specifically the various proposals submitted to us for the reform of the Port of London. We feel, however, that it is necessary to say that none of them were brought before us in a completely workable form. Those who framed them regarded the matter from special and diverse points of view, and did not possess the full information which has been elicited by our inquiry. While, therefore, we found the various schemes useful in assisting us to reach our own conclusions as to the best course to be adopted, we have not been able to recommend the adoption of any one of them as it stands. The chief questions raised by the various proposals submitted to us will appear in the course of the statement of our conclusions and recommendations.

---

---

PART V.

---

CUSTOM HOUSE ARRANGEMENTS.

---

## CUSTOM HOUSE ARRANGEMENTS.

246. We were directed by the reference made to us to inquire into the "arrangements for warehousing dutiable goods." We heard evidence upon the subject from Merchants and Wharfingers, and also from Sir George Ryder, K.C.B., the Chairman of the Board of Customs, and Mr. J. Fleming, a Surveyor-General to the Board.

247. The dutiable goods, *i.e.* tea, tobacco, foreign spirits and beer, coffee, chicory and cocoa, sugar, wine, dried fruits, and a few other articles of small importance, form, as a whole, considerable portions of the imports of London, and some of them come in immense quantities.<sup>1</sup> The Port of London has, for instance, almost a monopoly of the tea trade. Sir George Ryder remarked that "it is undeniable that the scattering of wharves and warehouses over many miles of river, and the necessity of unloading vessels into lighters 670. "which carry goods of a duty value of many hundred pounds at a time, by night and day, to otherwise inaccessible landing places, cause much trouble and expense to the Customs and risk to the Revenue." Sir George Ryder added, "It is not for this department to attempt to direct the course of trade. We follow trade wherever it goes, in obedience to the two principles that govern our action in all cases, *viz.*, the security of the revenue, and the convenience of the merchant."

248. The peculiar difficulties of the Thames were also dwelt upon by Mr. Fleming. He pointed out that the warehouses had to be near the centre of the town, but that the modern large ships had to discharge, for want of 368. space, far away down the river, and that the difficulty had to be met by the system of lightering "unexamined goods in every direction along the course of the river between the lowest dock and the highest approved wharf."

249. Under the influence of the desire to reconcile convenience of merchants with security to revenue a complicated and peculiar system has gradually grown up in the Port of London. The greater part of dutiable articles are conveyed in the first instance to bonded warehouses, situated either at the various docks, or uptown, or at riverside wharves, which have been sanctioned by the Board of Customs for the reception of all, or certain, dutiable goods. If dutiable goods are not put into bonded warehouses, Fleming 366. subject to payment of duty when taken out, the consignee can pay duty when they are landed, and then take them away. There are different classes of "sufferance" wharves where, as well as at the dock quays, all goods, or certain kinds of goods, can be landed, free goods to be examined and cleared, and dutiable goods, if taken away, to be assessed for dues. These wharves are grouped under the control of Customs officers. If any man wishes to have a wharf approved, he only has to prove to the Board of Customs that there is a reasonable prospect of sufficient business being done there. This scattering of business over miles of river makes London a peculiarly difficult and expensive port, from the point of view of the Customs Department. Traders also suffer, inasmuch as one officer cannot be attached to each sufferance wharf, but must visit in turn each of the 368. Ryder, 7478. wharves in his group, and delays therefore are not always avoidable.

250. Some complaints were made to us by traders of insufficiency of hours worked by Customs officers.<sup>2</sup> All goods can be discharged between 6 a.m. and 6 p.m., and free goods can be examined and cleared between Fleming, 375. those hours. The Crown does not undertake the expense of bringing dutiable goods to account except between the hours of 8 a.m. and 4 p.m. Fleming, 387-411. from 1st March to 31st October and 9 a.m. and 4 p.m. during the other six months. These are the authorised hours during which bonded warehouses in London may remain open, and weighing, gauging, &c., proceed

<sup>1</sup> To these have now been added duties on corn and flour.

<sup>2</sup> Smith, 2528; Jacobs, 3739; Deering, 3962; Innes Rogers, 8701.

412. without charge by the Customs to the merchant. In busy seasons additional hours are allowed to warehouses, but in that case the merchant or warehouse proprietor pays the Customs officers for their attendance.

676. 251. The Chairman of the Board of Customs said in his evidence that if some concession in this direction were thought by the Royal Commission to be desirable, and if the Treasury were disposed to sanction it, the most useful form which it could take would be an extension of the Customs warehousing hours from 4 p.m. to either 5 p.m. or 6 p.m., the day in the latter case not beginning perhaps before 9 a.m. He thought, however, that it was very doubtful if any concession could be made in London, unless it were extended to other ports. He pointed out also (1) that habitual attendance for over eight hours work a day implies an increase of staff, because it can only be provided for by an overlapping arrangement, under which part of the staff come and leave early, and the rest come and leave late ; (2) that overtime without charge releases the merchant and wharfinger from the valuable check against needless or wanton demands for extra attendance that is afforded by having to pay for it ; (3) that the boon may prove in reality to be of little value to the merchant, though costly to the Exchequer, because the Customs charge for extra attendance is small compared with the other charges entailed on him for labour by prolonged hours.

252. The evidence given by the experienced Customs officers corroborates the conclusions drawn from much other evidence that the dispersed character of the river trade increases the cost of the Port for all concerned. If, by improvements of the channels and docks, the upper docks near the warehouses and the centres of trade can be made stations more suitable for the discharge of goods from large ships than they are at present, the Port of London will be greatly benefited.

## SUMMARY OF REASONS FOR THE CREATION OF A PORT AUTHORITY.

---

253. It has, in our opinion, been proved that the Port of London is in danger of losing part of its existing trade, and certainly part of the trade which might otherwise come to it, by reason of the river channels and docks being inadequate to meet the increased and increasing requirements of modern commerce.

This Port must always be the great channel through which the dense urban regions in the Lower Thames Valley draw the bulk of their supplies. But the power of the Port to provide the convenience necessary for modern shipping may have an effect on the price of those supplies. Rapid unloading and distribution of cargo are advantageous alike to shipowner, merchant and consumer. The large vessels, as the cheapest carriers of cargo, will probably dominate the oversea traffic of the future. They require deeper river channels and more ample dock accommodation. Ports which cannot adapt themselves to the new necessities must, in spite of custom and tradition, rapidly fall behind in the struggle for trade. With all due allowance for the fall in money values, we have seen that the re-export trade of London has certainly not advanced during the last twenty years, and there are signs that it may diminish under the stress of foreign competition. We have further seen that the Port of London might cease to be the greater distributor to the coasts of England, and that even some part of the supplies of London itself might come in small vessels from distributing ports in neighbouring countries. Par. 24.

We have also found that there is at present great difficulty in improving the Port of London in consequence of the division of powers among different Authorities, and, in so far as the chief Dock Company is concerned, by reason of its financial position. Par. 31.

254. The Thames Conservancy, to whom the old municipal function of maintaining and improving the river channels has been entrusted, does not possess sufficient revenue from existing sources, chiefly shipping dues, to enable them to fulfil their obvious duty. They have not, as we have pointed out, attempted to procure from Parliament the additional financial and other powers which were necessary if they were to undertake the works needed for the permanent improvement of the river, although the need was continually impressed upon them. Moreover, the constitution of this body is not such that we could advise its being endowed with the power of raising the revenue for, or exercising the responsibility of, executing the works which we have felt it to be our duty to recommend. Pars. 50-66.

255. Another Authority exercising various functions in the Port of London is the Trinity House, to which is entrusted the buoying and lighting of channels in respect of which the Thames Conservancy have the duties of formation and maintenance. Further, the pilotage jurisdiction is in the hands of the Trinity House. The exclusive right of navigating lighters is in the possession of an ancient labour guild, whose monopoly has been a cause of wide-spread complaint.

It is, in our judgment proved by the evidence that this distribution of power between distinct Authorities is contrary to the interests of the Port as a whole.

256. The docks in London are as essential to the working of the Port as the river itself. We find that the London and India Docks Company, which has most of them in its possession, is unable, for reasons already explained, to raise the further large sums necessary in order to construct the new docks, and to make the improvements in those now existing, shown to be necessary if the Port is to meet the requirements of modern trade. The Company have themselves admitted that they are unable to carry out these Pars. 164-189.

Para. 192-199

works unless they are entrusted by Parliament with the power of levying dues on barges and upon all goods which enter their docks, whether delivered overside or not. This proposal is keenly resented by the wharfinger and other riverside interests, which have grown up on the faith of long existing rights to the free use of the docks, and have a large capital invested in their properties. This body of traders consider that to give to the London and India and other Dock Companies the powers which they desire, and without which they cannot execute large improvements, would be equivalent to giving to rivals in the warehousing business the power of taxing them. Mainly out of this arises the present deadlock, to the universally admitted detriment of the general public interests of the Port.

Para. 148-157.

257. With regard to the ability of the other Dock Companies to raise fresh capital, one, the Millwall Dock Company, is in an unfavourable financial position, and the other, the Surrey Commercial Dock Company, is prosperous in consequence of certain special conditions.

258. Even if the Dock Companies were in a position to raise the sums and to carry out the improvements required, yet the interdependence of the proposals for improving the river and of those for improving the docks, and the peculiar conditions under which the trade of the Port of London is carried on, render it highly desirable that these two closely connected elements of the Port should be no longer controlled by independent Authorities. The Companies admit that the utility of Dock improvements would depend largely on the simultaneous deepening of the river and its approaches.

Para. 216-225.

259. Attention has been called in this Report to the public character and to the success of the Port Authorities existing in the chief maritime cities of the United Kingdom. We have also referred to the public administration of foreign Ports which have in recent years become formidable rivals in competing for the shipping trade, and especially for the large ocean steamers, and to the effective expenditure which is being made in the case of these Ports.

Para. 226-232.

Para. 233-244.

260. It has been shown that there exists in London among shipowners, merchants and representative bodies, a powerful consensus of opinion in favour of the consolidation of powers at present divided, and the creation of a single public Authority for the control and improvement of the Port.

261. In these circumstances we strongly recommend that such an Authority should be constituted.

#### TRANSFER OF POWERS AND PROPERTIES TO THE NEW AUTHORITY.

262. We think that all the powers and property of the Thames Conservancy in connection with the river below Teddington should be vested in the new Authority, at and from the date to be appointed for the commencement of operations under the constituting Act. The powers of the Trinity House so far as they relate to the area of the Port of London as defined by the constituting Act should also be transferred at the same date. All the powers of the Watermen's Company connected with the licensing and control of watermen and lightermen, and the regulation of lighters and other craft, should also be transferred to the new Authority.

263. We recommend that by the same Act all the powers and property of the London and India, Surrey Commercial, and Millwall Dock Companies should be vested in the Authority, subject to any liabilities as hereafter indicated, and that the actual transfer of the docks should be completed by a date as early as possible to be fixed by the Act.

We deal under the head of finance with the mode of effecting the purchase of the docks.

264. We do not desire to recommend any change with regard to the sanitary and police control of the Port, nor with regard to railway and other docks not included among those which we have named.

## RECOMMENDATIONS WITH REGARD TO THE DOCKS AND WAREHOUSES.

265. In arriving at our conclusion with regard to the docks we have not forgotten: (1) That the docks are not all on the same footing and do not all serve precisely the same purposes, and (2) That the Dock Companies combine dock business proper with warehousing business.

266. We considered whether it would be possible to recommend the transfer to the new Authority of the lower docks only, leaving the London and India Docks Company in possession of their older docks, and not taking over the properties of the Surrey Commercial and Millwall Dock Companies. If this course were followed there would be a competition between, on the one side, a Public Authority controlling the river and the river works of improvement, supported by a large revenue, and owning some of the docks, and, on the other side, Dock Companies owning the remaining docks. It appears to us that a competition of this kind would be unfair to those Dock Companies whose property was unpurchased, or only purchased in part. Apart from this, we think that such a division of the docks would be disadvantageous to the interests of the Port as a whole. A chief advantage in the case of a Port where all docks are under a single authority, is that the distribution of the traffic can be better organised. If, on the other hand, there are competing Dock Companies, or Dock Companies competing with a Port Authority, it is much more difficult to distribute the traffic so advantageously. There is also a danger that ships may be drawn by the temptation of lower rates, or of discounts and rebates, to docks which are not the best suited, in the general interests of the Port and its trade, for their reception.<sup>1</sup> Apart from the opinion which we have formed as to the Port of London, the weight of evidence both with regard to home and foreign ports is in favour of the consolidation of all docks in a port in the hands of a Port Authority.

267. The second question, with regard to the warehouses, was still more serious. We had to consider whether we could recommend that the warehouses, as well as the quays and water areas of the docks, should be taken over and managed by the new Authority.

268. If, on the one hand, this was done, we had to face the objection that an Authority, controlling the improvements, and regulating the traffic of the river, supported by revenue obtained from dues on shipping and goods, and in possession of the quays and waters of all the docks, and possibly assisted by contributions or guarantees from the rates of London, would, in its warehousing business, compete at an advantage against the public and private wharfingers and warehouse owners, who do at present so large a part of the trade of the river, and who have invested so much capital in their properties.

269. Again, we are anxious that no unnecessary burden should be laid on the new Authority. The reasons for entrusting it with the control of the River and of the Docks do not apply with the same force to the case of the Warehouses. The requirements of the Port in this respect appear to have been sufficiently met by private capital and enterprise. Nor can the members of a public body be expected to give the financial facilities and the close and constant attention to minute and complicated details which are important in warehousing business. The new Authority must gain in public esteem and influence in proportion as its business appears clearly to be the administration of a Trust for the general advantage, and not an undertaking involving commercial rivalry.

270. We were fully sensible of the real weight of these objections, but, on the other hand, difficulties attend any proposal to take over the dock quays and waters without the warehouses. Physically, the warehouses, except some up-town ones, are more or less in juxtaposition with the quays. In parts of the London and St. Katharine Docks they rise vertically from the water edge. Commercially also the warehousing has

<sup>1</sup> See Mr. Girdlestone's evidence, 4688 and 4691.

been closely united with the rest of the dock business. It would be contrary to the general law that the Authority should take over by compulsory purchase from the Companies the quays and water areas, and leave the warehouses in their hands.

271. We were, therefore, brought to the conclusion that it will be necessary for the Authority to include in its purchase of the docks all the warehouses belonging to the Dock Companies. We think, however, that in the peculiar circumstances of the Port of London, and in view of the division of trade between the docks and the riverside traders, it may be found to be inexpedient that the new Authority should carry on permanently the business of warehousing. We are of opinion, therefore, that the Authority, after taking over the warehouses, should, subject to the conditions mentioned in the next paragraph, sell or lease such of them as would not be usefully employed in the enlargement of the quays or transit sheds.

272. In order to secure these objects we recommend that the constituting Act should provide that the Authority should, within a period from the acquisition of the dock properties to be fixed by the constituting Act, offer the warehouses for sale or lease in such order and manner as may be convenient, at reserve prices which shall be fair and reasonable. The Authority in the meantime and until such sale or lease is in each case effected, at not less than the price fixed, would carry on the business of such warehouses. In cases in which it proves impossible without great loss to separate warehouses from the docks, we think that the Authority should be authorised permanently to retain such warehouses.

273. We have purposely recommended elasticity in the mode of dealing with the warehouses, because, although on the one hand it has been pointed out (paragraph 180) that the extension of free goods and other circumstances have had a tendency to diminish warehousing at the docks, yet, on the other hand, an increase in the number of dutiable goods, or other circumstances, might have the reverse effect.

#### LIMITS OF THE PORT.

274. We recommend that the Port of London for all purposes of the new Authority should be defined as extending from Teddington Lock, as being the present tidal limit, to a line drawn from Havengore Creek, in Essex, to Warden Point, in the Isle of Sheppey, in Kent. This line is about two nautical miles further east than the present frontier of the Thames Conservancy for dredging purposes, and corresponds with the present actual eastward limit of the Customs Port, and with that of the Thames Conservancy for collecting Port dues. The southward limit of the Port should be the southern line specified in the second schedule of the Thames Conservancy Act, 1894, so far as it applies to the area west of the line from Havengore Creek to Warden Point, thus excluding the Medway.<sup>1</sup>

275. Power might be given to the Board of Trade to extend by Provisional Order from time to time for the special purposes of dredging, buoying, or lighting, the powers of the Port Authority as far as the line between Harwich Naze and the North Foreland defined in the second schedule to the Thames Conservancy Act 1894, and referred to in the second section of that Act.

#### FINANCE.

276. We have now to consider—

- (1) The mode in which the docks are to be purchased.
- (2) The capital expenditure which will be necessary for the improvement of the river and the improvement and extension of the docks, and the method in which capital to meet such expenditure is to be raised.

<sup>1</sup> The actual Customs Port is delimited by an Order, dated 1st August, 1883, made by the Lords Commissioners of the Treasury, under the authority of the Customs Consolidation Act, 1876. See Appendix, p. 757.

1. *Mode in which the Docks are to be purchased.*

277. The usual method of acquiring large undertakings by a public Authority has been to fix by arbitration the value of the undertakings, and then to raise loans in the market and to pay the whole value in cash.

278. In the present case, without expressing an opinion adversely to the alternative of raising a loan, we recommend as a probably more convenient and economical method—which, without inflicting any loss or injury upon the holders of securities and shares in the dock companies, would avoid the uncertainty, expense, and leakage incident to raising such considerable loans in the money market—the following procedure :

- (1) The docks, with all other property belonging to the three dock companies named in paragraph 263, should be vested in the Port Authority subject to any liabilities with respect to debenture stock, as well as to any mortgage debt and to any debt, liability, or other obligation of each company then existing.
- (2) The Authority should be empowered by the Act to create up to a certain limit a Port Stock bearing interest at a rate guaranteed in the manner hereinafter explained (paragraph 298 *post*).
- (3) The Port Authority should issue to each company in consideration for the undertaking so transferred such an amount of Port Stock as may be agreed upon between the Authority and the company, or in default of agreement, as may be determined by a Court of Arbitration to be constituted under the Act.
- (4) The Stock so issued to each company shall be applied and distributed among the shareholders in such a manner as may be determined by the Court of Arbitration.

279. With regard to the principles which we think should guide the Arbitrators, we submit the following observations :—

We think that the pecuniary position of the present proprietors of the docks to be purchased should be rendered neither worse nor better, due consideration being had to all the circumstances of the case, by the expropriation; that, in other words, the proprietors should be indemnified. Indemnity is the principle which governs the purchase clauses of the Lands Clauses Consolidation Acts, and we recommend, therefore, that that principle be applied by the Court of Arbitration to the present case. But certain modifications, chiefly of procedure, in the Lands Clauses Act, appear to us to be desirable. We see no advantage, but, on the contrary, unnecessary cost, in those provisions which require the vendor and purchaser, in default of agreement, to nominate respectively an Arbitrator, and enable the two Arbitrators to nominate an Umpire. The frequent result of these provisions, in practice, is that Arbitrators fall into the attitude of advocates, and that the responsibility of decision rests solely with the Umpire. Again, we consider that unnecessary cost and delay would be incurred in arbitrations of such magnitude as that under consideration, if the Court of Arbitration had itself to value all the subjects of sale in detail, and we think that some portion of that task might be delegated.

Again, though the conventional allowance of ten per cent. for forced sale is possibly justifiable in the case of the dispossession of an owner of land or houses, this allowance is not added in practice to the compensation for the compulsory extinction of trade interests, and we can find no solid reason for it in the case of shareholders, whose position will be affected nominally rather than substantially, by the substitution of a Public Trust for a Limited Company.

Some inconvenience, delay, and cost in re-investment may result to certain holders of dock securities from this latter change, which in ordinary cases would, *inter alia*, be met out of the allowance of ten per cent. As we have advised that this be not recognised, we recommend that the Court of Arbitration shall be empowered to make such compensation for the inconvenience referred to as, to it, may appear just.

280. We are now in a position to summarise in outline our recommendations on the principles and procedure which should regulate the

arbitration. We recommend that the principles of the Lands Clauses Consolidation Acts be applied with the following modifications, viz., that—

- (1) In place of a single Arbitrator, or of two Arbitrators and an Umpire, a Court of Arbitration, consisting of three persons, to determine the value of the undertaking, should be constituted by the Bill.
- (2) The Court of Arbitration should be authorised to delegate to one or more persons such details of the arbitration as it may think fit, provided always that the delegated tribunal be bound to hear and determine for the Court of Arbitration the questions submitted to it judicially, and after duly hearing the parties affected.
- (3) The purchase price should be payable in Port Stock bearing interest at a fixed rate.
- (4) The customary ten per cent. for compulsory sale should not be recognised, but the tribunal should have power to make such allowance as may appear to it to be just, to indemnify the shareholders for the inconvenience and delay (if any) sustained by them by the change in their security.

281. We think that the Port Stock might be properly included among the securities in which a trustee may invest under the powers of the Trustee Act, 1893.

*2. Capital Expenditure which will be necessary for Improvement of the River, and Improvement and Extension of the Docks.*

282. We estimate the capital sums which should be expended within ten years from the commencement of the existence of the Authority upon permanent works of improvement in the channels of the river and subsidiary works at not less than £2,500,000.

We estimate the capital sums which should be expended within the same period upon improving the docks so as to meet modern requirements and in constructing new docks at not less than £4,500,000.

283. With regard to the resources for meeting this expenditure we submit the following observations.

The new Authority will in the first instance succeed to the revenue of the bodies which it supersedes. That is to say that it will take over the revenue now appropriated to the Thames Conservancy in respect of the river below Teddington, and the revenue derived by the Dock Companies from their undertakings. The net revenue may possibly be somewhat increased by economies effected through centralisation of administration, while it may be fairly anticipated that the revenue from these existing sources will eventually be increased through the improvements of the Port and the natural increase of the size and trade of London and its district.

At first, however, it would not be prudent to assume that this revenue will be more than sufficient to meet the current expenditure of the authority, including payment of interest upon the Port Stock issued in respect of the acquisition of the docks.

284. The Thames Conservancy in recent years have not spent in works of maintenance the whole of their lower river revenue available for dredging, and have applied a portion to works of improvement; but, with the deepened channels recommended, at least the whole of their present revenue, and probably larger sums, would in the future be required to be expended in works of maintenance.<sup>1</sup>

285. The Authority, if it takes over the duties of the Trinity House as to lighting and buoying within the Port, will incur, and the Trinity House will be relieved from, an expenditure under these heads. This expenditure would most equitably be met by an equivalent grant from the General Lighthouse Fund representing the annual sum of which the fund would be relieved by the transfer of jurisdiction and outlay.

Pilotage would, as now, be self-supporting.

<sup>1</sup> See paragraph 68.

See par. 80.

See par 163.

286. The total net revenue derived during the three years ending 31st December, 1901, from the undertakings of the London and India, Surrey Commercial, and Millwall Dock Companies has been as follows :—

NET REVENUE OF THE DOCK COMPANIES FOR THE THREE YEARS ENDING  
31ST DECEMBER, 1901.

	1899.	1900.	1901.	Average net Revenue for three years.
London and India Dock Company - -	529,232	528,692	573,482	543,802
Surrey Commercial Dock Company - -	101,097	114,462	115,726	110,428
Millwall Dock Company - - - -	31,261	33,316	44,550	36,375

Some portion of the net revenue of the companies was put aside for reserve fund and other purposes, but the great bulk of it was applied in paying interest upon debenture stock and in dividends.

287. If the warehouses be sold at a reserve price, or let, the interest on the purchase money when invested, or the rents, as the case may be, will, we assume, be sufficient to produce to the Authority a net revenue equal to that now derived from the warehouses. However this may be, we think that, looking to all the circumstances of the case, the total net revenue derived from the dock undertakings, in their present condition, may be taken as remaining about the same as now.

288. If it should be decided to adopt the method of acquiring the dock undertakings which we have suggested in paragraph 278, it may be assumed that the total net revenue derived from those undertakings will be required to meet the interest upon the Debenture Stock, for which the Authority will become liable and the interest upon the Port Stock to be created for distribution among the shareholders in lieu of their existing stock, and to meet also purposes other than payment of interest and dividend to which part of the net revenue is now applied. We should recommend that the commencement of a sinking fund to redeem the stock should be deferred for a period of at least ten years from the date when the constituting Act comes into operation.

289. It thus appears to be probable that all revenue from existing sources will be fully engaged. If the Authority is to raise both the sum of £2,500,000 estimated to be necessary for permanent improvement of the river, and the sum of £4,500,000 for the improvement and extension of the docks, or a total sum of £7,000,000, additional revenue to meet debt charges to these amounts, together with the increasing cost of maintenance and working expenses, will have to be provided.

### 3. Method of Raising the Capital.

290. It is clear then that the provision of an adequate revenue for the Port Authority implies some increase in the charge upon the trade of the Port, nor do we find any hesitation on the part of those most competent to form a judgment in recognising that this must be the case. We entirely concur, however, with the view that, having regard to the existing and increasing competition with the Thames of other and especially of certain foreign ports, such additional charge should be confined to the provision of such improvements as are strictly necessary, and may be expected to be productive.

291. In these circumstances, we have considered whether a part of the foregoing sum of £7,000,000 might not be provided otherwise than by the Port Authority.

292. In Germany, Holland, Belgium and France large capital expenditure at the ports has been provided from national as well as from municipal

funds, with the result, as we have indicated, of placing the Port of London at a certain disadvantage. The idea has been brought before us that this course might be pursued with respect to the Thames. We see no reason for placing any charge on the National Exchequer in respect of this particular river, especially as we think the end may be otherwise achieved.

293. The River Thames with its Port and Docks must always be a great and vital highway of commerce to the many millions dwelling on or within a few miles of its banks. Within comparatively recent times, the maintenance and improvement of the lower Thames was a duty and charge incumbent on the Corporation of the City of London, as being then the only representative municipal authority. Circumstances on which it is needless to enlarge rendered it needful to create other authorities, viz., the Thames Conservancy and London County Council, with functions as to river and finance, which were formerly associated (from the necessity of the case) with the City Corporation.

294. The County Council and the Corporation, in the evidence placed before us, and the proposals made by them, showed, as might be expected, a strong and practical anxiety for the improvement and welfare of the Port of London.

The County Council proposed that they should, upon certain conditions, use their credit for raising the sum requisite for the purchase of the docks. They also proposed to make up, by a grant from the rates, any deficiency which might arise between the revenue on the one hand, and the expenditure on the other, of the new Authority.

The City Corporation showed equal anxiety for the improvement of the Port.

The earnest and public spirited desire thus indicated for the welfare and improvement of the Port should, in our opinion, be welcomed, and advantage should be taken of the powerful assistance of the Council and the Corporation, though in a form rather different from that put before us.

295. We think that it would be best to treat the improvement of the river and the purchase of the docks separately, and that the Council and the Corporation might provide the cost of the first as a grant by them to the Port Authority.

296. We therefore suggest, in view of the circumstances set out and reasons given in the foregoing paragraphs, that the capital sum needful for the deepening, widening, and improving of the river channels (now estimated at £2,500,000), should be provided by the London County Council and the City Corporation, in proportions to be agreed, or, if the assent of both be not forthcoming, then by one of these bodies by way of subvention spread over ten years. The Port Authority should, in the first instance, and before commencing the works to be executed by this capital sum, obtain the approval of the Authorities or Authority contributing the subvention to the works thus proposed to be carried out. In case of a difference of opinion as to their nature or extent the question should be submitted to the decision of the Board of Trade. The full responsibility imposed and the powers conferred upon the Port Authority by the constituting Act should in no wise be impaired or interfered with by the suggested grant thus made with the object of placing the great water highway of London in an efficient condition, and of, in some degree, lessening the need of imposing a charge upon the trade of the Port.

297. If the suggestion thus set forth be adopted, it would relieve the Port Authority of the need of raising revenue to meet the interest on the sum of £2,500,000 estimated to be required for river improvements. If, on the other hand, from unwillingness on the part of the bodies indicated, no such contribution were made, further charges must be laid upon the trade of London than would otherwise be the case.

298. We recommend, that, in addition to the capital assistance by the Municipal Authorities to the Port, the London County Council and City Corporation should be authorised to give a guarantee, either jointly in proportions to be agreed or severally, for the payment of interest upon the stock to be created by the Port Authority. This guarantee would be in addition to the primary security afforded by the revenue which the Authority

will be empowered to collect and raise. It will enable the transfer of the dock properties to take place under advantageous conditions, and will enable the capital necessary for the improvement of the docks and river to be raised upon favourable terms.

299. If, as we recommend, the capital for the permanent improvement of the river channel be furnished by the Municipal Authorities, it will be sufficient that the Port Authority should raise by issue of Port Stock the capital requisite for making the improvements and extensions of the docks. This sum we have estimated at 4,500,000*l.*, an outlay which may fairly be expected to be productive.

#### *4. Sources of Revenue of the Port Authority.*

300. The existing powers of the Thames Conservancy and the Dock Companies to charge tonnage dues upon shipping would pass to the new Authority.

The tonnage dues of the Thames Conservancy are undoubtedly low as compared with those of other British ports, but since the Port of London, on account of its difficulty of approach at some seasons, its cost and quality of labour, and some other circumstances, is already a dear port for a large class of ships, it would, in our opinion, be inexpedient seriously if at all to increase the river dues.

301. The present maximum tonnage dues leviable by the several Dock Companies upon shipping using their docks are as follows, viz. :—At the docks belonging to the London and India Docks Company 1*s.* 6*d.* per ton; at the Surrey Commercial Company's Docks 1*s.* per ton. At the Millwall Docks there is no statutory maximum.

The statutory maximum rate for all these Docks should, we think, in future be 1*s.* 6*d.* per ton. As regards the charge actually levied, we hope, without expressing an opinion which should in any way be regarded as binding on the new Port Authority, that a rate of 1*s.* (which was in existence for many years at the London and India Docks and at the Surrey Commercial and the Millwall Docks) will be found to be sufficient.

302. We have found ourselves unable to recommend any repeal of the "free-water clauses" in the Dock Acts. Under the new government of the Port, it would, however, be fair, and advantageous also for reasons connected with the regulation of the traffic, that the Authority should have power to levy a licensing fee, according to tonnage and description, upon all barges using the Port, and plying in the river or in the docks, or in both. We have shown that the barges have considerably grown both in size and in the part which they take in the traffic of the Port. It appears to be only fair that the barges should henceforth make a moderate contribution towards the revenue of the Port. The best method, we think, will be that every barge should be required to have a licence from the Authority, renewed and paid for annually, and that at each renewal the owner should pay a sum for his license under a list of charges therefore scheduled according to classes of barge tonnage.

The Authority might without undue pressure upon trade levy upon these barges a not inconsiderable sum.

303. The main source of the additional revenue which will be required by the Authority should be dues upon goods landed in the Port, including in that term both river and docks. In this, the Port of London would follow the precedent set at Liverpool, Glasgow, Newcastle, Bristol, and most of the leading ports in the United Kingdom. These dues are paid in some cases directly by the consignee, in other cases indirectly, by arrangement, through the ship-owners. It is true that if the dues were heavy their objects might be defeated, since goods might be diverted and come to London through other ports and railways. We apprehend, however, that the distribution of so comparatively small a sum, over such a mass of goods, would not have this result.

Within certain scheduled maxima of dues upon different classes of goods the Authority would have power, from time to time, to adjust the dues as might be equitable and convenient.

304. We have made inquiries from some of the leading Port Authorities as to the process by which dues upon goods entering their ports are collected, as to whether there has been found to be much difficulty or expense in the process, and as to what, if any, classes of goods are exempted. Their replies are printed as an appendix to this Report.<sup>1</sup>

So far as regards goods landed in the docks in London there will be no more difficulty than at Liverpool and elsewhere in collecting the dues. With regard to goods landed at wharves and piers in the stream there might be some difficulty, but not, probably, of a serious character if a right selection of the goods to be affected by dues be made.

305. There should not, in our opinion, be dues upon export goods nor upon goods which merely enter the Port for transshipment and re-exportation. The exemptions made at Liverpool in respect of such classes of goods would probably afford a useful model when modified so as to suit the conditions of London.

306. It will be understood that the dues upon goods which we propose will be over and above those now leviable at the docks in respect of goods which pass through the docks and are warehoused, or taken away by land, and generally for services rendered. But, in view of the complaints which have been made as to these latter charges, it will be well that the dock committee of the Authority should consider the expediency of dealing with what is known as the "consolidated rate." This committee should separate under distinct heads the charges for all services and facilities rendered, including those for the warehouses.

307. To sum up, then, our recommendations upon these points, we propose that the Port Authority should be empowered :

1. To retain the powers now possessed by the Thames Conservancy of levying dues upon ships which enter the Port.
2. To levy, subject to the statutory maximum, dock tonnage dues upon all ships which enter the docks, and to fix charges upon goods landed in the docks other than those dealt with on overside conditions.
3. To levy annual licensing dues upon barges.
4. To impose dues upon import goods entering the Port, except goods for transshipment, subject to maxima for different classes.

308. We do not desire and must not be understood by thus specifying methods of raising revenue to exclude the consideration and adoption of any other mode should it be found essential to the financial position of the Port Authority. Subject to due safeguards that body ought to have some general powers for such a purpose.

#### CONSTITUTION OF THE AUTHORITY.

309. In forming our opinion as to the best composition of the Port Authority, we have carefully considered the different proposals submitted to us by the London County Council, the City Corporation, the Chamber of Commerce, and the views expressed by various witnesses. The constitutions of the Port Authorities of Liverpool, Glasgow, the Tyne and other important ports have also had our careful consideration, and we have had regard to the distinguishing features of London, and especially to the multiplicity of interests involved.

310. The Authority should, in our opinion, consist of nominated and elected members. The nominated members should be chosen partly by Municipal and partly by National Authorities, and should include persons belonging to the Mercantile community, with which object the Governors of the Bank of England might be, with advantage, one of the Nominating Authorities.

311. In departing somewhat, in this last suggestion, from the precedents of other great British ports in respect of the constitution recommended, we

<sup>1</sup> Appendix F, page 191, *post*.

have kept before us the fact that London differs from them in its enormous population and the magnitude of each class of the interests affected. In Liverpool a distinguished merchant or shipowner is known throughout the whole community. In London such a man is often neither a member of the London County Council, nor of the City Corporation, and, in the vast aggregate of individuals gathered there, his capacity is known only among a section. He may, therefore, be unwilling to submit himself to election. If the obstacle of election be removed the interests of the commercial world will, we think, be sufficient to secure the co-operation of men of high business capacity in the service of this most difficult work of administration.

312. The elected members should be elected by different groups of traders interested in the Port, acting as separate constituencies, so that no important interest will run the risk of being altogether excluded from representation.

313. We suggest then, that—

(1) The Port Authority should consist of about 40 persons, partly nominated and partly elected.

(2) On the assumption that the London County Council and the City Corporation accept the financial responsibilities which we have recommended, the nominated members should be appointed by the following bodies :—

(a) By the London County Council	- - - -	11 members
(b) By the City Corporation	- - - -	3 „
(c) By the Admiralty	- - - -	1 „
(d) By the Board of Trade	- - - -	1 „
(e) By the Trinity House	- - - -	1 „
(f) By the Kent County Council	- - - -	1 „
(g) By the Essex County Council	- - - -	1 „
(h) By the London Chamber of Commerce	- - - -	2 „
(i) By the Governors of the Bank of England from among persons belonging to the mercantile com- munity of London	- - - -	5 „

(3) The elected members should be elected by different groups of voters, viz :—

(j) By the oversea (or ocean) trading shipowners	- -	5 members
(k) By the short-sea trading shipowners	- -	2 „
(l) By the wharfingers and owners of private ware- houses on the river	- - - -	3 „
(m) By owners of lighters, barges and river craft, including river passenger steamers	- -	2 „
(n) By railway companies connecting with the docks	-	2 „

The above figures are only given by way of suggestion, and it is obvious that they should be materially altered if the London County Council and the City Corporation, or either of these bodies, should abstain from assuming the responsibility of the expenditure and guarantee which we have indicated. It may also be desirable, for other reasons, to vary the proportions, or to include some other interests.

314. The electing persons, firms or companies, should be given a number of votes varying according to the amounts paid in dues upon goods, or upon shipping as the case may be. It would be necessary, also, that the constituting Act should contain provisions regulating the retirement, and re-election or replacement, of a certain number of members of the Authority in every year. It is not within our province to enter into details upon these matters. Precedents will be supplied by the constitutions of other Port Authorities, and that of the Tyne Commissioners will probably be found of special value, as it was reviewed and amended in Parliament at a date as recent as 1898.

315. The members of the Trust should be unpaid, but it may perhaps be desirable to pay a small salary to the members nominated by Government Departments, and possibly it may be advantageous to attach a more considerable salary to the posts of Chairman and Vice-Chairman.

In the performance of the duties of the Trust its members will be doing work of the highest civic, and even of national, importance.

316. The Authority would naturally appoint standing Committees for the transaction of various departments of its business, subject to the general control of the Body as a whole. We think, however, that provision should be made in the constituting Act for a Statutory Committee for the management of the docks and works of dock improvement. This Committee should consist of a stated number of members appointed by the Authority, and should have power to co-opt a limited number of expert persons from outside.

#### RECONSTITUTION OF THE THAMES CONSERVANCY FOR THE INLAND RIVER.

317. When the powers of the Thames Conservancy in respect of the river below Teddington are transferred to the Port Authority, it will be necessary that, either by the same Act, or by a concurrent Act, provision should be made for the reconstitution of the Conservancy as a body for the control of the river above Teddington. It would, no doubt, consist in the main of representatives of the riparian counties and towns. It is not within our scope to suggest the exact composition of the body so reconstituted, but we think that, in view of the importance to the channels of the lower river of maintaining a sufficient flow of water over Teddington Weir, the Port Authority should have the right of nominating one or two members of the new Conservancy Board.

The accounts of receipts and expenditure placed before us by the Thames Conservancy Board show that the revenue derived from sources above Teddington will be sufficient to meet the expenditure.<sup>1</sup>

#### THE WATERMEN'S COMPANY.

318. We have recommended that all the powers of the Watermen's Company which relate to the river, should be transferred to the new Authority.

319. We think that in the interests of public safety the new Authority should license watermen for employment in passenger traffic, including river steamboats.

But we agree with the Thames Traffic Committee of 1879 (page 47 of their Report) in not thinking it necessary that men employed in the navigation of non-passenger-carrying lighters, should have any licence, or be subject to any examination. Employers should in this class of craft be left free to employ any men whom they choose, subject to the fullest responsibility for the acts of those they employ. It is, we think, true that the artificial restriction has placed the river traffic too much under the control of a limited class of men, and has, perhaps, by removing the stimulus of open competition, encouraged among them habits which the paternal and well-meant care of the Court of Watermen is not always sufficient to correct. We have received complaints, especially from the officials of dock companies, who may, however, be somewhat prejudiced, as to carelessness and want of discipline among the lightermen. We do not think that public safety will be endangered by removal of qualifying examinations. An owner who commits valuable cargo to a barge, is not, for his own sake, at all likely to select an incompetent crew.

In this recommendation, it should be noted, we are not in agreement with the Report of the Select Committee of the House of Commons on the Thames Watermen and Lightermen Bill, 1890.

320. In connection with the financial part of our proposals, we have recommended that all lighters should be annually licensed by the Port Authority. This process will give to the Authority a control over river craft, and they will be able before renewing licences to take into consideration any complaints as to the trustworthiness of the lightermen. All river craft

---

See paragraph 48.

should have a conspicuous registration number, so as to allow easy identification by the river police and others.

321. The transference of their powers and loss of fees will materially affect the Watermen's Company. They will cease to have any functions, except those of administering certain charities, and will have little revenue apart from that derived from endowments, which are affected by charitable trusts. In these circumstances, and in view of the fact that the company is regulated by Act of Parliament, some statutory provision as to its future will be required. We recommend that provision should be made, if necessary, from the revenue of the Port Authority for compensation to the inspectors of the Company or other officials for any loss which they may sustain, and that power should be given to the Charity Commissioners to make a scheme for the future regulation of the charities which are now administered by the Company for the benefit of aged or incapacitated freemen and their widows. Such a scheme should secure the benefits to persons of the same class, with a priority for existing freemen of the company.

#### PILOTAGE.

322. The transfer of powers of licensing pilots within the Port of London from the Trinity House to the Port Authority will involve some amendment of the provisions of the Merchant Shipping Act, 1894. The line of division of pilot's work at Gravesend under Sec. 618 (1) of the Act would in future naturally correspond with the seaward limit of the Port under the jurisdiction of the new Authority between Havengore Creek and Warden Point.

323. Rates of pilotage within the Port would be fixed by the Authority, and, so long as the system of compulsory pilotage for ships making journeys of certain kinds continues to be law within the Port of London, the distinction between pilots licensed to conduct all ships, and pilots of a lower qualification, licensed to conduct exempted ships, would presumably continue.

324. Provision would have to be made to safeguard the interest of existing river pilots, who are transferred to the service of the Port Authority, in the "Trinity House Pilot Fund" referred to in paragraph 88 of this Report.

325. We have thought it to be our duty to mention complaints as to compulsory pilotage and its legal results which have been made in the evidence which we have taken, and to call public attention to the forgotten Reports of the Select Committee of 1870, the Thames Traffic Committee of 1879 and the Select Committee of 1888. The exemption of ships subject to compulsory pilotage from liability for damages presses with peculiar hardship on the barge-owners who are a large and important class in the Port of London. We do not think, however, that it is within the scope of our reference to make any recommendation as to the connection between compulsory pilotage and immunity of a shipowner for damage, which concerns general law. It will be competent for the Port Authority, if they should think it to be consistent with public safety, to apply to the Board of Trade for a Provisional Order, under Section 578 of the Merchant Shipping Act, 1894, exempting all ships in the Port of London from compulsory pilotage, and annexing to such exemption any terms and conditions which may be desirable. See pars. 90-100.

#### CUSTOM HOUSE ARRANGEMENTS.

326. We have referred to this subject in paragraphs 246 to 251 of our Report. We do not feel that the evidence before us is sufficient to enable us to offer usefully an opinion upon this matter, but we desire to call the attention of the Lords Commissioners of Your Majesty's Treasury to the complaints which we have mentioned.

## CONCLUDING OBSERVATIONS.

327. In conclusion, we desire to say that our inquiry into the conditions of the Port of London has convinced us of its splendid natural advantages. Among these are the geographical position of the Port; the magnitude, wealth and energy of the population behind it; the fine approach from the sea; the river tides strong enough to transport traffic easily to all parts, yet not so violent as to make navigation difficult; land along the shores of a character suitable for dock construction and all commercial purposes. In addition to these advantages, London possesses docks which, although they are not in some cases upon the level of modern requirements, are yet capacious and capable of further development. The deficiencies of London as a Port, to which our attention has been called, are not due to any physical circumstances, but to causes which may easily be removed by a better organisation of administrative and financial powers. The great increase in the size and draught of ocean-going ships has made extensive works necessary both in the river and in the docks, but the dispersion of powers among several Authorities and Companies has prevented any systematic execution of adequate improvements. Hence the Port has, for a time, failed to keep pace with the developments of modern population and commerce, and has shown signs of losing that position relatively to other Ports, British and foreign, which it has held for so long. The shortcomings of the past cannot be remedied without considerable outlay. We are, however, convinced that, if, in this great national concern, energy and courage be shown, there is no reason to fear that the welfare of the Port of London will be permanently impaired.

All which we humbly submit to YOUR MAJESTY'S gracious consideration.

(Signed) REVELSTOKE.

# ROYAL COMMISSION ON THE PORT OF LONDON.

## APPENDICES TO REPORT.

No.	DESCRIPTION.	PAGE.
A.	- Report of the Lower Thames Navigation Commission, 1894-1896, referred to in paragraphs 5 and 50-65 of the Report.	126.
B.	- Extracts from Reports of the Select Committee of the House of Commons on the Pilotage Bill of 1870, the Thames Traffic Committee appointed by the Board of Trade, 1878-79, and the Select Committee of the House of Commons on Pilotage 1888, referred to in paragraph 98 of the Report.	130.
C.	- Exemption of Free-water sections in the Dock Acts, referred to in paragraph 135 of the Report.	133.
D.	- Report upon the Docks in the Port of London made to the Commission by Mr. R. C. H. Davison, M. Inst. C.E., referred to in paragraph 137 of the Report.	135.
E.	- Correspondence subsequent to the close of the evidence relative to the expenditure by the Mersey Docks and Harbour Board upon new works and improvements, referred to in paragraph 224 of the Report.	187.
F.	- Correspondence relative to the collection of dues upon goods in certain Ports of the United Kingdom, referred to in paragraph 304 of the Report.	189.
G.	- Charts of the River Thames.	192.

## APPENDIX A.

(See paragraphs 5 and 50 to 65 of the Report.)

## REPORT of the LOWER THAMES NAVIGATION COMMISSION, 1894-96, APPOINTED UNDER THE THAMES CONSERVANCY ACT, 1894.

## Appendix

To the Right Honourable CHARLES THOMSON RITCHIE, M.P., President of the Board of Trade.

London, 25th March, 1896.

## A.

SIR,

As the Commissioners appointed by the Board of Trade for the purposes of the Inquiry above referred to, we have the honour to submit the following Report:—

Messrs. Williams, Torrey, and Field, Ltd.  
(Atlantic Transport Line.)  
Messrs. W. Smith and Co.  
Messrs. J. B. Westray and Co. (Ducal Line.)  
New Zealand Shipping Co.  
Messrs. Alex. Howden and Co.

London and India Docks Joint Committee.  
Short Sea Traders' Association.  
Wharfingers and Warehousekeepers' Association.  
Essex Sewers Commission.  
The Southland Corporation.  
Kent and Essex Sea Fisheries Commission.

7. We have held seven public sittings for the purpose of taking evidence and hearing arguments. We have inspected the Thames and adjoining Creeks between Gravesend and the Nore, and have carefully studied all the trustworthy charts of this portion of the river which we have ascertained to exist. The result of our examination of these charts, which are extremely instructive, are embodied in Appendix A.

8. It being chiefly at the instance of the London Association of Shipowners and Brokers that authority was given by Parliament for the appointment of this Commission, the evidence which the Association placed before us had, throughout, our most careful consideration, as setting out the complaints of those important interests with regard to the present condition of the portion of the Thames referred to us, and as formulating their demands for measures of improvement. The owners, pilots, and navigating officers of the larger class of vessels frequenting the Thames, who were called by the Association, agreed unanimously in pressing for a low water channel of 30 feet up to Gravesend, and many of them urged, that in order to meet the requirements of safe navigation by ships of considerable tonnage, this depth should be carried on to the entrance of the Royal Albert Dock. The London Association of Shipowners and Brokers practically represent almost the whole of the large steam vessels trading to or from the Port of London.

9. The Engineers to the Tyne Commissioners and the Clyde Navigation Trustees gave us an account of the extensive and costly dredging works which have been successfully carried out in recent years, and are still being prosecuted, in the rivers under this charge.

10. The Engineer-in-Chief of the London and South-Western Railway described to us how at Southampton his Company has completed a channel which would afford a low water depth from the sea to the Empress Dock of 30 feet.

11. The Chairman of the Works Committee of the Mersey Dock and Harbour Board stated that, whereas there had been a depth of only 10 feet of water over the Mersey Bar, it was now improved to 20 feet, and the Board hoped by further dredging to obtain a depth of 30 feet. We understand that the depth, at the present date, on the bar has been increased to 23 feet.

12. The Thames Conservancy, through their officials, gave us their Board's history and past policy, together with an account of the works executed, and proposed, for the improvement of the portion of the river between Yantlet Creek and London Bridge. They also, with regard to the river below Yantlet Creek, laid before us their view that the inconvenience caused to navigation by the deficiency of depth through the Leigh Middle Shoals is "by no means of a serious nature," and after quoting some calculations of tides (see Appendix B, p. iv), mentioned "that only the very largest class of vessels can be affected by this Bar."

13. The Corporation of London, represented by the City Remembrancer, supplied us with records relating to the Port. He watched the proceedings throughout, and, while expressing his desire to render every assistance, did not feel it necessary to lay any evidence before us.

Portion of estuary referred to Commission.

Seaward limit of Conservators' jurisdiction.

No navigation authority east of Yantlet Creek. Buoying and lighting of Thames and its approaches by Trinity House.

Leigh Middle Shoals form main subject of Inquiry.

Rise of Tide.

Public notice given of Inquiry.

Bodies represented at Inquiry.

1. The portion of the Thames Estuary referred to this Commission between Thorney Creek and the Nore Lightship is about  $8\frac{1}{2}$  nautical miles in length, and has a low water width of from 1,400 yards to upwards of 4,000 yards with varying depths. It embraces the mouths of the Benfleet and Leigh Creeks on the north side and of the Medway and the Yantlet Creek on the south side of the river, and is marked by dotted lines on the foregoing chart.

2. The seaward limit of the Thames Conservators' jurisdiction is at Yantlet Creek, which is  $3\frac{1}{4}$  miles below Thorney Creek. Their authority thus extends for that distance into the area on which we have to report.

3. Between Yantlet Creek and the Nore Lightship, and seaward thereof, the channels of the Thames are not under any conservancy body for the purposes of navigation, though the Kent and Essex Sea Fisheries Commission are charged with certain duties in respect of the protection of the fisheries. The buoying and lighting of the whole of the navigable part of the Thames and its approaches, both within and beyond the jurisdiction of the Thames Conservancy, are under the control of the Elder Brethren of the Trinity House.

4. Between Thorney Creek and the Nore Lightship are situated the extensive shoals known generally by the name of the Leigh Middle Shoals, which form the main subject of this Inquiry, and will be referred to in detail hereafter. They extend from 1 mile westward of Yantlet Creek to about 3 miles eastward of it, a distance of 4 miles. They are about 14 miles below Gravesend and the Tilbury Dock, 29 miles below the Royal Albert Dock, and 36 miles below London Bridge.

5. The average rise of spring tides above the low water datum at Sheerness, which is abreast of the shoals in question, is given on the Admiralty Chart as 16 feet, and that of neap tides as  $13\frac{1}{4}$  feet.

6. The appointment of the Commission, its object, and the date and place of the first sitting were, in November, 1894, communicated to the London press, and this resulted in the appearance of the following bodies:—

The Thames Conservancy.  
The Corporation of London.  
The London County Council.  
The London Association of Shipowners and Brokers, Limited, representing the undermentioned firms and companies owing about 500,000 tons of shipping—  
Messrs. Anderson, Anderson and Co.  
W. Becket Hill. (Allan and Wilson Hill Lines.)  
Messrs. Duthie Brothers and Co.  
The General Steam Navigation Co.  
Messrs. Gray, Dawes, and Co. (British India Line.)  
Messrs. Houlder Brothers and Co.  
The Orient Steam Navigation Co., Ltd.  
The Peninsular and Oriental Steam Navigation Co.  
Messrs. Scrutton, Sons and Co. (Direct Line to West Indies.)  
Messrs. Shaw, Savill, and Albion Co., Ltd. (Shaw, Savill Line.)  
Messrs. George Thompson and Co. (Aberdeen Line.)  
Messrs. Frederick Green and Co.

London  
County  
Council.

14. The London County Council, represented by some of their Members and their Solicitor, tendered evidence through their Engineer, who described to us the steps, so important in the interests of navigation, which the Council had taken for precipitating the solid matter from the Metropolitan sewage and carrying it by means of special steamers to Barrow Deep. He also explained what is being done by the Council and by the Vestries and District Boards of the Metropolis to keep road detritus from the river; further, by special order, he impressed upon us the view of his Council, that the preservation and improvement of the Thames is of great National and Metropolitan importance, and gave his individual opinion, as an engineer, that a 30-ft. channel should be provided for the whole distance from the sea up to the Albert Dock.

London  
and India  
Docks  
Joint  
Com-  
mittee.

15. The London and India Docks Joint Committee watched the proceedings by a representative, but expressed no views.

Short Sea  
Traders'  
Associa-  
tion, and  
Whar-  
fingers,  
Ware-  
house-  
keepers,  
and  
Granary-  
keepers'  
Associa-  
tion.

16. The Short Sea Traders' Association, and the Wharfingers, Warehousekeepers, and Granarykeepers' Association, by their respective Solicitors, watched the proceedings with a view to the protection of the interests of the owners of smaller vessels frequenting the Thames. The representatives of these two Associations though raising no objections to the important improvements demanded by the witnesses of the London Association of Shipowners and Brokers, stated that such works would be of little or no benefit to the smaller class of vessels, and expressed their desire to urge upon us at the proper time their contention that no portion of the cost involved should fall upon the owners or freighters whom they represented.

Southend  
Corpora-  
tion and  
Essex  
Sewers  
Commis-  
sion.

17. The Southend Corporation and the Essex Sewers Commission watched our proceedings in the interests of frontagers and of proprietors dependent on the banks which protect the lands within the jurisdiction of the Sewers Commission.

Kent and  
Essex Sea  
Fisheries  
Commis-  
sion.

18. The Kent and Essex Sea Fisheries Commission was represented by their Solicitor, who, by himself and his witnesses, called our attention to the fishing interests, and the mischief which, in their opinion, might accrue to them if any tipping of dredged or other material were allowed in the portion of the river used by the fishermen.

Extracts  
of Evi-  
dence to  
be found  
in Appen-  
dix B.

19. We have attached to this report a copy of the whole of the evidence brought before us; and extracts therefrom will be found in Appendix B.

Latest  
survey in  
1883; new  
one there-  
fore  
required.

20. Having ascertained that no part of the Thames had been surveyed since 1883, we thought it absolutely necessary to obtain accurate information as to the present condition of the river, and we accordingly arranged, with the assistance of the Admiralty and the Thames Conservators, for a new survey to be made. This has naturally occupied a considerable time, but as a result we are now in possession of a complete chart of the Thames from Blackwall to the Nore, all the soundings upon which were taken during the past year. We need not enlarge on the great value of this information, which we hope will shortly be made public in its entirety.

Part of  
the new  
survey  
between  
Thorney  
Creek and  
the Nore  
shown on  
latest Ad-  
miralty  
chart.

21. Part of the new survey is embodied in the Admiralty Chart (No. 1185 printed and published in September, 1895), which shows the present channels of the Thames from Thorney Creek to the Nore. The chart indicates the buoys which mark the navigable channel through the Leigh Middle Shoals, in the positions to which the Trinity Brethren have recently moved them in consequence of the information afforded by the new survey.

Twenty-  
five feet  
channel  
through  
Leigh  
Middle  
now  
buoyed.

22. The buoys now define a safe channel through the Leigh Middle Shoals, with a low water depth at ordinary spring tides of not less than 25 feet, as compared with a limiting depth of 24 feet in 1883.

Drift  
experi-  
ments  
indicate  
reduced  
current off  
Southend.

23. With the assistance of the Thames Conservancy, and their engineer, Mr. C. J. More, M.Inst.C.E., we caused a series of drift experiments to be made with deeply immersed floats.

24. These are described in Appendix A (see Charts I, J, K, and L), and although they do not show the maximum speeds at all the various stations, they indicate that the general velocity of the currents opposite Southend is considerably less than those prevailing in the narrower parts of the river above Scar Elbow.

Appendix  
A  
continued

25. Basing the calculation on the facts shown by the new survey, and on the 124 consecutive tides mentioned in the statement laid before us by the Thames Conservators, we find that an inward-bound or outward-bound vessel drawing 25 feet of water, with an allowance of 2 feet under the keel, would pass the Leigh Middle Shoals without delay at any time of tide; on about 125 days in each year, but might, if she arrived at an unfavourable time of tide, be detained for want of water on the remaining 240 days. The period of such delay would vary from a moment to about three and a-quarter hours.

Vessels  
arriving  
at Leigh  
Middle  
near time  
of low  
water  
would  
have to  
wait.

Under similar conditions vessels drawing 26 feet would pass at all times of tide unhindered on about 55 days; though on the remaining 310 days they might have to wait. The period of such delay would vary from a moment to about four hours.

Those drawing 27 feet would pass unhindered at all times of tide only on 13 days; and on the remaining 353 days of the year the period of delay might vary from a moment to four and three-quarter hours.

And those drawing 28 feet might have to wait every day in the year for periods varying from a moment to about five and a-quarter hours.

26. The above calculations of detention may require to be modified in accordance with the various views of pilots and others navigating the Thames on the subject of the proper allowance of depth under the keel of vessels in different conditions of tide and other circumstances.

27. It is obvious from the history of Sea Reach, as set out in Appendix A, that the channels through the Leigh Middle Shoals from the year 1775 (at which date the first trustworthy records commence) up to the present time have been in an unstable condition. At times, owing to the channels having been favourably situated with regard to the tidal currents or from other causes, there has been a navigable depth of water, with a suitable width through the shoals, of upwards of 30 feet at low water of spring tides, and at other times there has not been more than 23 feet available. Throughout the whole period under review there has always existed a great depth of water, viz.:—from 40 to 60 feet, in the main channel of the river both immediately above and below the situation of the Leigh Middle Shoals.

Channels  
through  
Leigh  
Middle  
always  
unstable.

28. These shoals are in a part of the river where an abrupt widening occurs, and their existence is no doubt due to this configuration of the banks and the consequent enfeeblement of the tidal currents. The same cause produces a set of the flood and ebb tides, slightly across the river towards the embayment on the north side, which circumstance is also prejudicial to the stability of any channel of considerable depth, even when favourable circumstances have produced it. It is therefore to be expected that in the future, as in the past, there will be no permanence of any particular channel until artificial means are employed to regulate and direct the tidal currents. So far as the material forming the shoals is concerned, the records of the various channels in times past, prove that all the shoals in question consist, for a depth of at least 30 feet below low water, of sand or silt which has at some period been moved by the currents of the river, and that there is thus no hard bar forming a natural obstruction.

Shoals  
due to  
excessive  
width of  
river.

29. As the point of view from which we have to regard the questions submitted to us (confined as they are by the Act of Parliament to the lower portion of Sea Reach) must depend upon what is, or will be in the near future, the condition of the upper parts of the Thames forming the approach to the Docks, we find it necessary to refer briefly to the circumstances affecting the river as far upwards as the navigation of large ships extends.

30. Seaward of the Leigh Middle Shoals there is ample depth of water reaching to 40, 50, and 60 feet, and abundant width for navigation. Again higher up the river we find such depths and widths existing in many parts of Sea Reach and for some distance above Gravesend. The river is thus evidently capable of maintaining an ample navigable channel if properly treated. But at present intervening shoals, limited in

Navigable  
depth of  
river from  
Sea to  
London  
Bridge.

Appendix area, exist between Gravesend and Thorney Creek, and one of these off Cliffe Creek reduces the navigable depth to 23 feet. Between Gravesend and the Royal Albert Dock the navigable depth at low water of spring tides is in places not more than 16 or 17 feet. Between the Royal Albert Dock and London Bridge the depth at low water of spring tides is limited by the Thames Tunnel to 12 feet. Apart from the question of depths, the want of width in many places occasions difficulties in the navigation of large ships between Gravesend and the Royal Albert Dock.

Thames Conservancy programme of improvements. 31. The Thames Conservancy have explained to us in evidence the programme of the improvements which they at present contemplate, and upon which they are engaged. The programme is as follows:—

	Minimum width.	Minimum depth.
A channel between Yantlet and Crayford Ness - - - - - (20½ nautical miles)	600 feet.	24 feet.
A channel between Crayford Ness and Bull's Point (Albert Dock Entrances) - - - - - (6½ nautical miles)	500 feet.	22 feet.
A channel between Bull's Point and the Thames Tunnel - - - - - (7½ nautical miles)	300 feet.	18 feet.
A channel between the Tunnel and London Bridge - - - - - (1½ nautical miles)	200 feet.	18 feet.

32. It is no part of our duty to express an opinion upon the intentions of the Conservators, as to deepening the river generally, conditioned as they may be by their financial resources or other matters, as the reference to us is limited by the Act of Parliament to the length of 8½ miles below Thorney Creek, but it is clear that the navigation of the Thames, which has always been a tidal navigation for ships of large draught, will remain so under the contemplated programme. We thus feel obliged to accept what is now aimed at by the Conservators as largely governing our recommendations with regard to the bar formed by the Leigh Middle Shoals, and to point out that, as there is in existence a good navigable channel through these shoals with a low water depth of 25 feet, it is a material fact that the Conservators have no present intention of providing a greater depth than 24 feet at a short distance higher up the river.

Demand of ship-owners. 33. It is right, however, in connection with this point to refer again to the evidence of the agents of the shipowners representing most important lines of steamers trading to various parts of the world. They brought before us instances of the improvements, in progress or realised, in the approaches from the sea to other places, mentioning particularly Southampton, Liverpool, and the Suez Canal, and they urged that the Metropolitan river should be, and can be, placed at least on an equality with the best of those ports. With this in view they unanimously demanded much larger works than are proposed by the Conservators, viz., a navigable channel of 30 feet below low water of spring tides at least as far up the river as Gravesend (in order that the navigation of the largest vessels should no longer be dependent on the tide as far as that anchorage and the Tilbury Docks), while many of them urged that the same depth should be continued as far as the entrance to the Royal Albert Dock. These gentlemen also pointed out the increase in the size of modern vessels, the consequent great expense of any delay to them, and the danger which such vessels incur in navigating a long stretch of river with insufficient water in which to anchor if caught in a fog.

Delays by fog, &c. 34. Although a heavily-laden inward-bound ship, which has to wait for some rise of tide before passing the Leigh Middle Shoals, may have in fine weather time enough, during a single tide, to pass up to the Albert Dock, and arrive there sufficiently near high water for being docked, we find that in many cases fog or unforeseen delays prevent this being done. In such cases she must bring up a second time and anchor some miles short of the docks, thus losing a tide which might have been saved but for the shoals between Gravesend and the sea. The same remark applies to ships leaving the Docks, with too great a draught to pass those shoals after three-quarters ebb.

35. Whatever may be done towards improving the upper river we recognise that it is highly important that all homeward-bound vessels should be able to reach, and foreign going vessels able to leave, Gravesend at any time of the tide. We concur then with the view of the shipowners and others that much public advantage would be gained, if a navigable depth of about 30 feet, suitable for vessels of the largest draught, were afforded at least up to Gravesend.

36. Above Gravesend, there may possibly be some complications affecting the feasibility of any serious deepening of the river by reason of valuable properties in places bordering its banks, and there may be questions as to the stability of the embankments which protect low-lying lands from being over-flowed. These matters would require careful examination, but we have not investigated them, as the upper reaches of the river are beyond the limits of our reference.

37. Strictly speaking also the river between Thorney Creek and Gravesend has not, as we have mentioned, been referred to us, but this length of the river is so intimately connected with the questions affecting the Leigh Middle Shoals that we have felt it our duty to investigate its condition, and we have satisfied ourselves that, apart from any question affecting the Leigh Middle Shoals, the river from Thorney Creek upwards to Gravesend might easily and cheaply be deepened to the extent of providing a channel sufficient for the passage of the largest vessels trading to the Port of London at all states of the tide, and that such an improvement could be maintained at comparatively small expense.

38. As there is no convenient anchorage for large vessels in the Lower Hope Reach, and as Gravesend is the true objective point in the lower river, it appears to us that no sufficiently useful purpose would be served by undertaking the much larger and more expensive work of deepening the channels of the Leigh Middle until the Thames Conservancy extend their programme in the direction above indicated. For these reasons we cannot recommend the immediate expenditure of money between the Nore and Thorney Creek.

39. We have given much attention to the system for many years adopted by the Thames Conservators, of depositing waste dredgings in "Dead Man's Hole," which is situated near Scar Elbow, and some three miles above the Leigh Middle Shoals. It appears from the evidence (Qs. 196, 197) that since 1878 the Conservancy have deposited in a part of this deep water, which is marked out by beacons, and measures 200,000 square yards, more than 2,000,000 cubic yards of waste dredgings. If the material had stopped where it was discharged the bottom over the whole of the 200,000 square yards would have been raised by many feet.

40. The recent surveys, however, show that while other portions of the river have become shallower the depth of "Dead Man's Hole" has not been reduced; and it follows that the solid material deposited there has found its way into other parts of the river or estuary. The extent to which it has moved eastwards, to the injury of the Leigh Middle Channel, or westwards, to the injury to the channel to Gravesend and London, is difficult to define; but the recent surveys by Captain Jarrad and the Conservators' staff place it beyond question that to discharge material in "Dead Man's Hole" is to distribute the larger part of it through the portions of the river most favourable to accretion.

41. We recommend that the practice be immediately stopped, and that the waste dredgings should either be taken to sea or deposited in suitable positions on the foreshores from which they cannot find their way into any navigable channel. In some places on the foreshore the material would be of value in filling up embayments, the existence of which is unfavourable to the most advantageous direction of the tidal currents.

42. We further recommend that, to avoid accentuating the mischievous widening of the river below Scar Elbow, no removal of material from the northern foreshore or shallow banks of the river should be allowed between Scar Elbow and Shoeburyness, and also that frontage owners should be encouraged to prevent the removal of any ground immediately above the high water line.

should be deepened up to Gravesend.

River between Thorney Creek and Gravesend easily deepened.

Deposit at "Dead Man's Hole."

"Dead Man's Hole" not reduced since 1878.

Deposit- ing to be immediately stopped.

Removal of fore-shore to be stopped between Scar Elbow and Shoeburyness.

Improved condition of the Thames.

43. We think the generally improved condition of the Thames since the survey of 1883 is undoubtedly encouraging, and we also think that the carrying out even of the limited programme of the Thames Conservancy cannot fail to have some effect in increasing the velocity of the tidal wave and the quantity of water entering and leaving the river. To that extent the projected works of the Conservators, and the mechanical effect of the navigation through the channels of an increasing number of larger vessels than were in the habit of passing through them, will tend to maintain or slightly increase the present depth.

44. Operating in the same direction are, and will be, the regulations made and enforced by the London County Council and other Metropolitan Authorities with the object of keeping the solid sewage, road detritus, and other refuse of London out of the river. We think more might be still done in the way of preventing the discharge of ashes and refuse from vessels, but we recognise that there has been of late years a stricter watch by the Thames Conservancy than was kept in past times when these practices no doubt assisted the other causes above referred to, in bringing about the deteriorations of the navigable depths which are shown by the charts of 1887 and 1883.

Causes of the instability of the Leigh Middle will remain until training works executed.

45. Although the above matters are, as we have said, encouraging, it is impossible to shut one's eyes to the important fact that the causes from which the instability of the Leigh Middle Channels and the continual movement of the adjoining shoals between the Nore and Thorney Creek result, will remain, so long as the widening of the river, to which we have referred, is permitted to exist.

Leigh Middle Shoals should be dealt with when Conservancy decide to improve the Channel between them and Gravesend.

46. We do not consequently believe that a low water channel with a depth of 30 feet and of adequate width can be practically made and maintained through the Leigh Middle Shoals by dredging alone, but that works for confirming the course of the river will be matters of necessity. Whenever the Conservancy decide to render the navigation of the river no longer tidal between Gravesend and Thorney Creek, such works would, in our opinion, be prudently and advantageously undertaken through the channels of the Leigh Middle.

47. If the desired depth of 30 feet at low water of spring tides, or something approaching it, is to be maintained permanently and economically through these shoals, the chief work for effecting the purpose should consist of a tidal training bank extending in a suitable direction eastward from Canvey Island, in order to direct and control the currents and prevent in the future such divagations of the channels as have occurred in the past. We are of opinion that no injury would be caused to the Benfleet or other creeks by such a work, but that an improvement to them would result.

Training works present no serious difficulty.

48. We think it is unnecessary at the present moment to consider in detail the design of such a work as we have indicated, or its cost, and desire to confine ourselves now to stating that the undertaking does not present any serious difficulties. In order to settle the proper height, size, shape, and precise alignment of the training bank, an enlarged survey and borings and many other particulars involving considerable time and expense would be required. We should be willing to enter upon the whole of these subjects if desired to do so, but it seems inexpedient to embark upon such details of investigation until there be a probability of the river above the shoals being correspondingly deepened by the Thames Conservancy, while, further, before designing a work of this description, it is necessary to be guided by experience in the immediate future as to how far there may be a continuance of the improvements in Sea Reach which are indicated by the survey of last summer.

Financial inquiry unnecessary.

49. Having come, with some regret, to the conclusion that works in the river between Thorney Creek and the Nore cannot at present be recommended, we have found it unnecessary to proceed with the second branch of our inquiry, namely, the source from which funds should be provided for works of improvement within that area. We fully recognise, however, that the deepening of the Thames is a matter of great importance, and that the mode in which the necessary funds should be provided demands very careful consideration. It

seems to us that the financial powers of the Conservators, whenever the fitting time arrives for undertaking the works, should be dealt with as a whole; for though we think it is expedient to provide a deep water channel to Gravesend (or even, possibly, to the Albert Docks), it is of equal, and, perhaps, greater, importance that no financial burden should be so placed as to damage the commercial interests of the Port of London in the present severe competition with other ports in this and foreign countries.

Appendix A. continued

50. We find from the new Chart and the tidal drift Yantlet experiments that the channel between the Nore Middle and Yantlet Shoals (which is fully described in the appendix under the name of the Yantlet Channel) is equal or superior to the present buoyed channel. In consequence also of the tide at the present time setting more directly through it than through the more northerly channels, and in view of the physical changes now in progress in the Nore Swatchway, we believe the Yantlet channel is likely to remain a useful route for large ships for some years to come. We recommend that it should be at once buoyed, and so made available for navigation. We also recommend that the small shoal patches in the Yantlet channel which limit its depth to 25 feet should be removed by dredging. If this be done a straight waterway 600 feet wide, with a limiting depth of 26 feet, would be provided, and the cost of the dredging in question would be so trifling that it might well be defrayed by the Conservancy out of their existing funds.

Yantlet Channel to be buoyed.

51. We have been informed that in addition to the discharge by the London County Council of the solid matter of the London sewage, contractors and others are permitted to deposit spoil in Barrow Deep, about 20 miles below the Nore, within defined boundaries. As the question of the suitability of Barrow Deep for these purposes is quite beyond the limits of the reference to us, we do not desire to express any opinion thereon, or on the possibility, as some apprehend, of these deposits affecting the approaches of the Thames, but we may remark that the matter is of importance, and warrants, in our opinion, careful watching.

Deposit of solid matter in Barrow Deep.

52. We strongly recommend that a competent Marine Surveyor should be immediately and constantly employed by the Conservators to sound and chart the Thames from the Nore upwards, and to record the tidal effects throughout its length. The importance of the traffic and the instability of the lower channels would alone point this out as being urgently required; but the facts which have been ascertained in consequence of the appointment of this Commission enforce the desirability of there being accurate surveys brought constantly up to date. Apparently neither the Navigation Authorities, nor the representatives of the shipping interests were aware, until the new soundings were taken, at the instance of the Commission, that there was a greater depth of water through the Leigh Middle than had been known to exist in 1883, nor that there had been a development of the Yantlet Channel into a better course for large ships than that hitherto used for navigation.

Competent Marine Surveyor to be constantly employed.

53. As a consequence of this want of information, it would appear that, for many years past, ships, both inward and outward bound, have been unnecessarily delayed. The loss of money entailed has probably been large as compared with the cost of frequent surveys.

Delay of ships through want of information as to channels.

54. As part of the duties in connection with the surveys, we recommend the establishment of at least four self-registering tide gauges, placed at points approximately equidistant between Sheerness and London Bridge, in such a manner that their records may be with accuracy referred to a common datum. The gauges should be kept continuously in working order, and the tide diagrams carefully preserved in a form and manner convenient for reference.

Establishment of self-registering tide-gauges.

55. Such observations would be of great value, and we much regret that no sufficiently accurate tidal records of previous years have been available to us during our investigations. Those that have hitherto been made, though adequate for navigation purposes, have not been such as can be relied on for tracing, with sufficient approach to accuracy, the changes which have taken place during past years in the range between high and low water or in the velocity of the tidal wave, upon which questions the extent of practicable improvements in the river and their maintenance must largely depend.

## Appendix

A. continued  
Jurisdiction of Conservancy to be extended.

56. Finally, we recommend that as so many important questions affecting the régime of the River have to be dealt with below Yantlet Creek, the jurisdiction of the Thames Conservancy should be extended by Parliament as far seaward as the Nore.

57. We desire to express our appreciation of the great assistance which has been rendered to us by our Secre-

tary, Mr. R. W. Peregrine Birch, M.Inst.C.E., as also by the Engineer of the Conservancy and his staff.— We have the honour to be, sir, your most obedient servants,

J. WOLFE BARRY.

G. S. NARES.

GEORGE FOSBERY LISTER.

## APPENDIX B.

(See paragraph 98 and 325 of the Report.)

EXTRACTS from the REPORTS of (1) the SELECT COMMITTEE of the HOUSE OF COMMONS on the PILOTAGE BILL of 1870; (2) the THAMES TRAFFIC COMMITTEE APPOINTED by the BOARD OF TRADE 1878-79; and (3) the SELECT COMMITTEE of the HOUSE OF COMMONS on PILOTAGE 1888.

## Appendix

1. EXTRACT from the conclusion of the Report of the Select Committee on the Pilotage Bill, 1870.<sup>1</sup>

## B.

"The objections to the practice of compelling ships to employ pilots are as follows:—

1. It is unjust, for it obliges many ships that do not require pilots, to pay for keeping up a staff for those who do.

2. The system tends to create and maintain a body of protected monopolists, whose interests are not identical with those of the shipowner, who know that they must be employed, and whose independent services are probably not so readily or so effectively given as if their employment depended on their efficiency.

3. A further and very serious objection is to be found in the consequence as regards liability, which has been so fully stated above.

The liability of the owner and his servants is to put an end to, and the security against mismanagement arising from this liability is seriously diminished, whilst persons sustaining damage by collision are deprived of their remedy.

"4. The captain and his officers, from their acquaintance with their ship and crew, are better able to handle her, even in pilotage waters, than a pilot to whom the vessel is strange. To compel the former to give up charge to the latter leads to disaster.

"The two last objections are fully admitted by most of the advocates of compulsory pilotage. And some of them, whilst advocating the retention of compulsory pilotage, still propose that the pilot shall not be allowed to interfere with, but shall only advise the captain; and that the shipowner shall be liable for the acts of the pilot.

"It is obvious, however, that any attempt to carry this proposal into effect would be met by very serious

opposition from the great body of shipowners. The legal principles on which the present law is founded, viz., that a man is liable for the acts of those whom he voluntarily employs, but not for the acts of those whom he is compelled to employ, appears to your Committee to be in itself just and reasonable. And if, for the sake of remedying a practical inconvenience, this principle is departed from, it is probable that further anomalies and inconveniences will be the result. Nor is it likely that the captain and the pilot will ever assume their proper relative positions so long as the former is compelled to employ the latter.

"Your Committee are therefore of opinion that the immunity from liability must stand or fall with the legal obligation to employ a pilot.

"Looking to the above considerations, it appears to your Committee, on the one hand, that the reasons alleged in support of compulsory pilotage admit of satisfactory answers; and that on the other hand, the evils to which it gives rise are of the most serious character, and are such that it is impracticable to cure them without abolishing compulsory pilotage altogether. They have, therefore, come to the conclusion that the principle upon which the Bill is founded is a right one, and that the Bill should, with the amendments which your Committee have made in it, be passed into a law at as early a date as possible. Your Committee are satisfied that if this is done, not only will the trade of the country suffer no injury, but that the step thus taken will lead to further improvements in the pilotage service of the different ports, and will in the end render that service more remunerative to efficient pilots as well as more satisfactory to their employers.

<sup>1</sup> Other important Extracts from this Report are given in the part of the Report of the Thames Traffic Committee quoted below.

## 2. EXTRACT from the Report of the Thames Traffic Committee 1878-79, pp. 38 to 39.

The law of compulsory pilotage in the Thames is subject to so many exceptions that it is not easy to state clearly what it is.

By the Merchant Shipping Act, 1854, sections 353 and 376, compulsory pilotage was continued in all districts in the United Kingdom in which pilotage was compulsory when the Act came into operation, including the Thames above Gravesend, and all existing exemptions from compulsory pilotage were continued.

By the 354th section of the same Act pilotage was made compulsory for coasting passenger ships, unless the master or mate should after examination become possessed of a pilotage license.

By section 379, the following ships, when not carrying passengers, were exempted:—

- (1.) Ships employed in the coasting trade of the United Kingdom.
- (2.) Ships of not more than sixty tons burden.
- (3.) Ships trading to Boulogne, or to any place in Europe north of Boulogne.

- (4.) Ships from Guernsey, Jersey, Alderney, Sark, or Man which are wholly laden with stone, being the produce of those islands

- (5.) Ships navigating within the limits of the port to which they belong.

- (6.) Ships passing through the limits of any pilotage district on their voyages between two places, both situate out of such limits, and not being bound to any place within such limits, nor anchoring therein.

The Trinity House have since extended the exemption of vessels trading to ports north of Boulogne to all vessels trading with any ports between Boulogne and Brest.

The Trinity House have also exempted ships which having come to this country with cargoes from a foreign port proceed in ballast to load at another port.

It is obvious that this state of things is full of anomalies. There is little or no reason in the exemptions. Many of the exempted ships require pilots quite as

much as the non-exempted ships. As a matter of fact the exempted ships actually employ more pilots than the non-exempted ships, whilst they pay less for them. It is obvious, therefore, that compulsory pilotage is not needed, either in order to secure the employment of pilots or to provide pilots with employment. On the other hand, it may be said that there is no hardship on the shipowner in requiring him to employ a pilot, when it is certain that he will employ one whether required or not; but any such hardship is a small part of the evil of compulsory pilotage.

In the first place, as above noticed, the rate of payment for the compulsory pilotage is higher than is found to secure efficient service in the case of exempted ships. In the second place, the division of the pilots into classes according as the ships are divided into exempted or non-exempted ships, is not justified by any distinction in the nature of the work done. In the third place, the relation between employer and employed, where service is compulsory on either, is seldom so satisfactory as when both parties are free. But the most important consequence of the law of compulsory pilotage is to be found in the exemption of the ship-owners from liability for damage done by his ship when the ship is placed in charge of a pilot by compulsion of law.

On this subject the committee of 1870 made the following observations:—

The first enactment on the subject was the 52 Geo. 3. c. 39, s. 30, in 1812:—

“No owner or master of any ship shall be answerable for any loss or damage for or by reason or means of any neglect, default, or incompetency of any pilot taken on board of any such ship, under or in pursuance of any of the provisions of this Act.”

The Pilot Act of 1825–6, Geo. 4. c. 125, which repealed the former Act, contained a section (sec. 55) in nearly the same terms. It exempted the owner from responsibility, not only when the fault was that of a pilot employed by compulsion of law, and also when the fault was that of a pilot acting in charge of the ship in pursuance of the Act, as explained in *Lucey v. Ingram*, 6 Meeson and Welsby, 302.

This enactment was repealed by the Merchant Shipping Act Repeal Act of 1854 (17 & 18 Vict. c. 120.), and was replaced by the 388th section of the Merchant Shipping Act of that year, which is in the following words:—

“No owner or master of any ship shall be answerable to any person whatever for any loss or damage occasioned by the fault or incapacity of any qualified pilot acting in charge of such ship within any district where the employment of such pilot is compulsory by law.”

The immunity of the shipowner is confined by that section to cases in which the damage is occasioned by the fault of the pilot acting in charge, where the employment of such pilot is compulsory by law. All doubt was also removed as to the immunity being applicable throughout the United Kingdom.

Before the first of these enactments, it appears that the Courts of Admiralty had always held the ship doing the damage responsible, notwithstanding that she was in charge of a compulsory pilot. And after the passing of the Act 52 Geo. 3, c. 39, Lord Stowell and Sir John Nichol, feeling the hardship caused by the exemption, refused to apply it on grounds which have been repudiated by later decisions.

These decisions have proceeded on the principle that where the law takes the ship out of the charge of the owner and his servants, and places her in charge of another person, it is a just and logical consequence that the owner should be relieved from the responsibility for acts of that person; and it has been laid down by high authority, that this consequence would follow from a mere legal obligation to employ a pilot, even if there were no express statutory provision exempting the owner from liability; but at the same time the courts have felt the hardship of the exemption as against the ship suffering damage, and have confined its application by a very strict application of the principle adopted by them. They have held that the employment of the pilot must be compulsory at the time. They have also held that wherever the casualty could be traced in any degree to the act of the master and crew, the owner was liable, and they have thrown on the owner the burden of proving that the casualty was caused by the pilot. These decisions have narrowed the injustice caused by the section, but have probably increased litigation, since the question whether a mistake was due to the pilot or the captain or crew is one extremely difficult to determine, and very likely to be productive of false evidence.

At any rate, the effect of this law, coupled with the frequency of collisions arising from the more crowded state of our channels and harbours, and the speed of steamers, is very remarkable. If a vessel navigated by a pilot, but commanded by a master who has passed his pilotage examination, does damage, the owner is responsible. If a vessel is navigated by a pilot whom, for any other reason, the owner is not obliged to employ, does damage, the owner is responsible. But if the vessel is navigated by a pilot whom the law requires him to employ, then, whether the owner would or would not for his own sake have employed the pilot, he is free from responsibility, and there is, practically, no remedy whatever for the injured party. The consequences, when followed out, are most absurd and most injurious. The following are some of the practical absurdities and inconveniences of this state of the law:—

The whole class of smaller vessels which frequent our ports, and which never need a pilot, are deprived of all remedy when in collision with a ship which is compelled by law to employ a pilot.

The Admiralty Court is occupied with collision cases in which the question is, not which of two ships was in the wrong, and how much she ought to pay, but whether the one ship or the other, or both, was in charge of a compulsory pilot, and whether that pilot was or was not in actual charge at the time, and committed the fault which caused the collision.\* This last question is one upon which it is most difficult to get at the truth.

Two ships, A and B, both of the same size and description, come into London, A from the North Sea, B from the Channel. Both employ a pilot. They get into collision. If A is in fault, B has a remedy; if B is in fault, A has none.

Two ships, A and B, say from Leith to London, both take a pilot at Orfordness. A has passengers; B has none. They get into collision. If A is in fault, B has no remedy against A; if B is in fault, A has a remedy against B.

Two ships again, A and B, bound from Havre to London, take pilots at Dungeness. The master of A has taken pains to pass a pilotage examination, and he has a pilotage certificate. The master of B has, perhaps purposely, avoided doing so. They come into collision. A has no remedy against B, whilst B has a remedy against A.

The object of the legislation of 1854 concerning passenger ships, viz., that of requiring, through the medium of compulsory pilotage, that masters should learn to pilot their own ships, is thus defeated. Your Committee are informed that there has actually been a case in which the master of a Scotch passenger steamer asked the Board of Trade to contract the limits of a certificate which they had granted him, because his ability to pilot his own vessel exposed his owner to liability when in charge of a pilot.

\* \* \* \* \*

A further consequence of this exemption from responsibility, coupled with the doctrines laid down by the Courts concerning the relation between the master and the pilot, is to remove the responsibility from the master of the ship, and to prevent him from attempting to interfere with the management of the pilot, however bad that management might be. The following is an extract from the judgment of the Privy Council, in the case of *Hammond v. Rogers*, in the case of “*Christiana*,” Moore’s Rep. p. 171. Baron Park says—“The duties of the master and the pilot are in many cases clearly defined. Under ordinary circumstances we think that the pilot’s commands are to be implicitly obeyed. To him belongs the whole conduct of the navigation of the ship, to the safety of which it is important that the chief direction should be vested in one only. It was never intended that, under ordinary circumstances, the master was to exercise any discretion whether he could obey the pilot or not. There may be extraordinary occasions when the master would be justified in disobeying the commands of the pilot. If from sudden illness or intoxication he becomes incompetent to command, the supreme authority would revert to the master during the pilot’s temporary incapacity. It may be the same in the case of manifest incapacity of a permanent character; but any opinion upon these questions is unnecessary for the decision of the present case, as none of these circumstances occurred. The pilot has unquestionably the sole direction of the vessel in those respects whereon his local knowledge is presumably required.” The same doctrine has been laid down by Dr. Lushington, and was relied on by the Court

\* See, for an instance of the questions raised, Dr. Lushington’s judgment in “*Earl of Auckland*,” Parliamentary paper, 455, 1862, No. 94.

Appendix.  
B.  
continued.

of Inquiry, in the recent case of the "Spindrift" as a reason for exempting the master from blame. The obvious tendency of such a state of the law is to induce the captain to abstain from all interference with the pilot, however necessary. If, in order to prevent obvious danger, he interferes, according to the above doctrines he makes his owner liable for the consequences. If he goes below, or stands by and sees the pilot run his ship into danger, he knows that the law will free him and his owner from all blame or liability.

Your Committee have the strongest evidence of the mischievous tendency and bad effects of such a state of the law. All parties are agreed that, as a general rule, the master is the person who ought to be responsible for the navigation of his own ship, and that the pilot ought to be his adviser only, to point out to him the peculiarities of the local navigation. The captain knows the qualities of his own vessel and of his crew, which the pilot does not, and he acts under a stimulus which it is impossible to apply to a pilot. So much do many of the best and most careful shipowners feel this that, in spite of the law and the possible consequences to themselves, they direct their captains never to give up charge to the pilot, but to use him as a local adviser only; whilst others say that they think this the safe and proper course, but hesitate to adopt it for fear of making themselves liable for damage.

In confirmation of the above opinion concerning the state of the law, your Committee would refer to the Admiralty regulations on this point. The following is the 7th section of the Navigation and Pilotage Regulations:—"The captain is to order everything that relates to the navigation of the ship to be performed as the pilot shall require; but, nevertheless, he and the master (that is, the navigating officer,) are to attend particularly to his conduct, and if, from his or his mate's observations, he shall have reason to believe the pilot not qualified to conduct the ship, or that he is running her into danger, he is to remove him from his charge and to take such measures for the safety of the ship as the circumstances may require, noting the time of the pilot being so removed in the ship's log-book; and if the ship be damaged at any time through the ignorance or negligence of the pilot, but where a common degree of attention on the part of the captain and master would have prevented the disaster, those officers will be deemed to have neglected their duty."

These observations are fully borne out by the evidence given to the present Committee. The representatives of the General Shipowners Society, of the General Steam Navigation Company, and of the wharfingers and barge owners, illustrate and confirm the objections pointed out in the above extract. The barge owners point out with great force that whilst they are bound to employ a particular set of men, they are liable for damage done, whilst if the barges or their cargoes are damaged by a ship in charge of a compulsory pilot, their only remedy is against the pilot.

The doctrine of immunity has been recently carried to a still greater length. The Conservators recently prosecuted a captain of a steamer for going too fast. The fact seems to have been proved, but the magistrate dismissed the case on the ground that the vessel was in charge of a compulsory pilot, and his decision has been affirmed on appeal by the Court of Queen's Bench.\* Consequently a law which can only be justified on the ground that it is necessary to prevent danger, actually becomes a shelter to those who do dangerous acts, and prevents the lawful authority from enforcing against them the just consequences of their actions.

These objections are admitted by most of the advocates of compulsory pilotage, and apparently by the

\* See Times Law Report, 16th June, 1879, Oakley v. Speedy.

Trinity House, for, whilst stating the arguments in favour of compulsory pilotage, they at the same time express an opinion that in accordance with what they understand to be the law in America and several Continental states, the immunity from liability of the owner should be abolished, and also that the pilot should be placed by law in the position indicated by the Admiralty regulations quoted above.

Your Committee think, however, that it would be difficult, if not impracticable, to carry this opinion into effect without abolishing compulsory pilotage. In the words of the Committee of 1870—

"It is obvious that any attempt to carry this proposal into effect would be met by very serious opposition from the great body of shipowners. The legal principles on which the present law is founded, viz., that a man is liable for the acts of those whom he voluntarily employs, but not for the acts of those whom he is compelled to employ, appears to your Committee to be in itself just and reasonable. And if, for the sake of remedying a practical inconvenience, this principle is departed from, it is probable that further anomalies and inconveniences will be the result. Nor is it likely that the captain and the pilot will ever assume their proper relative positions so long as the former is compelled to employ the latter."

Under these circumstances your Committee have no hesitation in recommending the abolition of compulsory pilotage above Gravesend. They are confirmed in this resolution by the following statement of the Elder Brethren:—

"As to No. 10. '*That compulsory pilotage and the immunity arising therefrom should be abolished above Gravesend.*' it will be gathered from the answers to the previous question that the Elder Brethren do not regard immunity as the corollary of compulsion, but as respects compulsion in the river, although the Trinity House cannot but have some anxiety whether without it the desirable safeguards can be properly provided, yet seeing that by legislation more or less contrarious, a state of great confusion exists, and that without compulsion owners as a rule do take pilots, the Elder Brethren have come to a resolution that as respects the river above Gravesend they would not oppose its abolition; trusting that, if abolished, the Legislature would, in the interests alike of life and property, and the prudent owner, entail on those who neglected to avail themselves of properly qualified servants penal and pecuniary consequences, at least as great as those for any variety of recklessness in land transit."

We are aware that, if compulsory pilotage is abolished, no ship, whether carrying passengers or not, will be required to take a pilot above Gravesend; and that the provision made in 1854, by which home-trade passenger ships are required, either to take pilots or to be navigated by officers who have passed a pilotage examination, will be virtually repealed. But the practice of home-trade passenger ships and of exempted ships shows that ships do as a matter of fact generally employ pilots above Gravesend, whether required to do so or not. As regards the provision requiring home-trade ships to take a pilot if they do not pass a pilotage examination, it is to be remembered that the principal object of that provision was to induce the officers to qualify themselves in pilotage. As a matter of fact very few masters of foreign going ships do so qualify themselves; and one reason of this is that when they are so qualified, pilotage ceases to be compulsory, and their ship ceases to enjoy the immunities from liability for damage which a ship in charge of a compulsory pilot enjoys. The abolition of the obligation to employ a pilot will do away with this reason, and will *pro tanto* encourage that pilotage qualification in masters and mates which the enactment of 1854, whilst intending to promote it, has really discouraged.

### 3. EXTRACT from the Report of the Select Committee of the House of Commons on Pilotage, 1888.

"The question of the continuance or the abolition of compulsory pilotage is one which your Committee have had before them from the commencement of their inquiry. The evidence on this subject has been of a conflicting nature, but your Committee do not feel justified, looking to the vast interests involved, in recommending that there should be any interference with the system as it now stands.

"They are of opinion, taking all the circumstances into consideration, and having regard to the advantages of decentralisation, that the principle of compulsion, as it now exists should not be interfered with, leaving to local pilotage authorities full and ample powers to adopt such systems and to frame such regulations, subject to

the sanction of Parliament, as may be most conducive to the interests of the trade and shipping of the particular port over which their jurisdiction extends.

"Your Committee are strongly of opinion, having regard to the views just expressed, that the time has arrived when the exemption of the owner from liability for damage done by his ship, when the ship is placed in charge of a pilot by compulsion of law, should cease to exist. Your Committee are of opinion that such exemption is indefensible, and is inimical to the safety of life and property at sea. In their opinion, the master of a vessel, even while a pilot is on board, should continue to be responsible for the conduct and navigation of his ship.

## APPENDIX C.

Appendix  
C.

(See paragraph 135 of the Report.)

## EXEMPTION OR "FREE WATER" SECTIONS in the DOCK ACTS.

(1) *London and India Docks Company.*

MEMORANDUM supplied by the Secretary of the Company with regard to the exemption clause in favour of lighters and craft.

An exemption clause was inserted in all the Acts originally constituting the various dock companies now represented by the London and India Docks Company. Taking them in order of date these sections are as follows:—

West India Dock Company, Section 138, of the West India Dock Act, 1799 (39 Geo. 3, cap. 69).

(*Exemptions.*) 138. Provided always, and be it enacted, that this Act shall not extend to charge with the said rate or duty of six shillings and eightpence per ton herebefore granted, any lighters or craft entering into the said docks, or basons, or cuts, to convey, deliver, discharge, or receive ballast or goods to, or from on board of, any ship or ships, vessel or vessels.

London Dock Company, Section 60, London Dock Act, 1800 (39 & 40 Geo. 3, cap. 47).

(*Exemptions.*) 60. Provided always, and be it enacted, that all lighters and craft entering into the docks, basons, or cuts to discharge or receive ballast or goods to or from on board any ship or ships, shall be exempted from any rates or duties.

East India Dock Company, Section 92, the East India Dock Act, 1803 (43 Geo. 3, cap. 126).

(*Exemptions.*) 92. Provided always, and be it enacted, that nothing in this Act contained shall extend or be construed to extend so as to charge with the said rates any lighters or craft entering into the said docks, basons, or other works, or any of them, to convey, deliver, discharge, or receive goods, wares, or merchandise, or other matter or thing whatsoever, to or from on board of any ship or ships, vessel or vessels in such docks, basons, or other works or any of them.

St. Katharine Dock Company, Section 116, St. Katharine Dock Act, 1825 (6 Geo. 4, cap. 105).

(*Exemptions from Rates, etc.*) 116. And be it further enacted, that all lighters and craft entering into the said docks, basons, or cuts to discharge or receive ballast or goods to or from on board any ship or vessel shall be exempted from the payment of any rate, and also all such ballast or goods so discharged or received shall be exempt from any rate, dues, or charge whatsoever.

Victoria Dock Company, Section 45, Vict. (London) Docks Act, 1853 (16 & 17 Vict., cap. 131).

(*Exemption from Rates.*) 45. That all lighters and craft entering into the said docks, basons, or cuts, to discharge or receive ballast or goods to or from on board any ship or vessel, shall be exempted from the payment of any rate and also all such ballast or goods so discharged or received shall be exempt from any rates, dues, or charges whatsoever.

It will be noticed that goods carried in barges were not exempted in the first three Dock Acts, but only the actual barge. The probable reason for this was that while the monopolies given to these companies lasted all goods had to be landed in the docks, and therefore incurred charges irrespective of how they were afterwards taken away.

The Victoria Dock Company's first Act of 1850, curiously enough, contains no exemption clause, but one was inserted when the company applied to Parliament for fresh powers in 1853.

All the above sections have long since been repealed, and the sections now in force are Section 136 of the London and St. Katharine Docks Act 1864 (27 and 28 Vic., cap. 177), which applies to the London, St. Katharine, Victoria and Albert Docks; Section 83 of the West India Dock Act 1831 (1 and 2 Will. IV., cap. 52), applicable to the West India and East India Docks; and Section 26 of the East and West India Dock Company's Extension Act 1882 (45 and 46 Vic., cap. 90), which applies to Tilbury.

These sections are as follows:—

5823.

(*Exemption from Rates.*) 136. All lighters and craft entering into the docks, basons, locks, or cuts to discharge or receive ballast or goods to or from on board any ship or vessel lying therein shall be exempt from the payment of any rates, so long as the lighter or craft is *bond fide* engaged in so discharging or receiving the ballast or goods, and also all the ballast or goods so discharged or received shall be exempt from any rate or charge whatever.

Section 136, London and St. Katharine Docks Act, 1864.

(*Exemptions from Rates.*) 83. Provided always, and be it enacted, that all lighters and craft entering into the said docks, basons, locks, or cuts, to discharge or receive ballast or goods to or from on board of any ship or vessel lying therein, shall be exempt from the payment of any rates so long as such lighter or craft shall be *bond fide* engaged in discharging or receiving such ballast or goods as aforesaid, and also all such ballast or goods so discharged or received shall be exempt from any rate or charge whatever.

Section 83, West India Dock Act, 1831.

(*Tonnage Rates in respect of Lighters, Barges, etc.*) 26. The tonnage rates which the Company may from time to time demand and take in respect of any lighter, barge, or other like craft entering their new dock, lock, or tidal basin, and for lying therein, shall not exceed the rate, rent, or sum which from time to time is charged by them in respect of vessels trading coastwise between the port of London and any port or place in the United Kingdom. Provided always that any lighter, barge, or other like craft entering the new dock, lock, or tidal basin, to discharge or receive ballast or goods to or from on board of any vessel lying therein, shall be exempt from the payment of any rate, rent, or sum so long as such lighter, barge, or other like craft shall be *bond fide* engaged in discharging or receiving such ballast or goods as aforesaid. Provided also that all such ballast or goods so discharged or received shall be exempt from any rate or charge whatever.

Section 26, East and West India Dock Company's Extension Act, 1882.

(2) *Surrey Commercial Dock Company.*

46. Provided always, and be it enacted, that lighters and craft entering into the docks or basons to discharge or receive ballast or goods to or from on board any ships shall be exempted from any rates or duties, such goods paying dues as in other cases.

An Act for completing and maintaining the East Country Dock at Rotherhithe (1811), 51 Geo. 3, cap. 171.

43. All lighters and craft entering into the said docks, basins, and cuts, to discharge or receive ballast or goods to or from on board any ship or vessel, shall be exempted from the payment of any rate; and also all such ballast or goods so discharged or received shall be exempt from any rates, dues, or charges whatsoever.

Commercial Dock Act, 1851, 14 & 15 Vict., cap. 43.

125. Provided always, that all lighters and craft entering the docks to discharge or receive ballast or goods into or from any vessel lying therein shall be exempt from the payment of any rates so long as such lighter or craft is *bond fide* engaged in discharging or receiving such ballast or goods, and the ballast or goods so discharged or received shall be exempt from the payment of any rates.

The Grand Surrey Docks and Canal Act, 1855, 18 & 19 Vict., cap. 134.

117. Provided always, that all lighters and craft entering the docks to discharge or receive ballast or goods into or from any vessel lying therein shall be exempt from the payment of any rates so long as such lighter or craft is *bond fide* engaged in discharging or receiving such ballast or goods; and the ballast or goods so discharged or received shall be exempt from the payment of any rates.

The Surrey Commercial Dock Act, 1864, 27 Vict., cap. 31.

(3) *The Millwall Dock Company.*

Provided always, that all lighters and craft entering into the canals, basins, or cuts, to discharge or receive ballast or goods to or from on board of any ship or vessel lying therein, shall be exempt from the payment of any rates so long as such lighter or craft shall be *bond fide* engaged in discharging or receiving such ballast or goods as aforesaid, and also all such ballast or goods so discharged or received shall be exempt from any rate or charge whatsoever.

Millwall Canal, Wharfs and Graving Docks Act, 1864, 27 & 28 Vict., cap. 55, sec. 59.

APPENDIX D.

(See paragraph 137 of the Report.)

REPORT by R. C. H. DAVISON, M.Inst.C.E., on the Result of certain Inspections and Inquiries made by him on behalf of the Royal Commission.

ppendix.  
D.

25, Victoria Street, Westminster. S.W.  
November, 1901.

To the Royal Commission on the  
Port of London.

My Lord and Gentlemen,—I have the honour to communicate to you the results of certain inspections and inquiries with regard to the Docks of the Port of London, which you appointed me to make on the 26th July, 1901.

(a) The depth of water at the centre of the River Thames opposite the various entrances to the Docks; the area of the dock property and water area; the size and cross section of the entrances to and of the passages within the various docks; the area and depth of water of the several docks and basins; whether pumping is used to raise the level of the water in the docks and basins; the power employed for the machinery of cranes, warehouse lifts, lock gates; and other particulars.

(b) Warehouses and transit sheds, their heights and materials, total floor area, by whom occupied and for what purpose, and their position relatively to the quays.

(c) State of repairs of each dock, its machinery, warehouses, and transit sheds, roads and quays, etc.

The docks dealt with are as follows:—

- 1. The St. Katharine Docks (page 134).
- 2. The London Docks (page 139).
- 3. The Limehouse Dock (page 147).
- 4. The Millwall Dock (page 149).
- 5. The West India Docks (page 152).
- 6. The East India Docks (page 159).
- 7. The Royal Victoria and Albert Docks (page 164).
- 8. The Tilbury Docks (page 171).
- 9. The Surrey Commercial Docks (page 174).

NOTES.

Trinity high water mark is 12 feet 6 inches above ordinary datum—that is, the datum used for the Government Ordnance Survey.

The depths of the River Thames are taken from the Admiralty Chart corrected to 1897.

The depths of water and levels in the various locks, passages, basins, and docks are from information obtained from the Dock Companies.

A bonded warehouse is any warehouse fitted with locks, etc., in accordance with the requirements of H.M. Customs for goods in bond, but when there are no dutiable goods in such a warehouse it is used as and becomes an open warehouse.

A. 1. THE ST. KATHARINE DOCKS.

St. Katharine entrance lock is situated 0m. 5f. 3chs. below London Bridge on the north side of the River Thames.

The depth of water at the centre of the River Thames opposite this entrance is:—

	Ft.	In.
At high water ordinary spring tides	33	4
At Trinity high water	32	4
At high water ordinary neap tides	28	4
At low water ordinary neap tides	14	4
At low water ordinary spring tides	11	0
Depth of Thames Conservancy proposed channel	12	0

The depth of water over the Thames Tunnel which passes under the bed of the river further down is at low water ordinary spring tides 11 feet, leaving a depth of material above the extrados of the arch of the tunnel of about 16 feet.

	A. R. P.
Area inside Dock Company's boundaries	23 0 0
Company's property not included in above	Nil.
Water area	10 0 37

THE ST. KATHARINE'S ENTRANCE LOCK.—Cross Section.

	Ft.	In.
Length between outer and inner gates	130	0
Divided by middle gates not used		
Deduct for swing of gates, etc.	say	15 0
Width at coping	45	0
Width at invert	35	0
Depth of water on centre of		

	Outer Sill.	Inner Sill.
	Ft. In.	Ft. In.
At high water ordinary spring tides	28 10	24 10
At Trinity high water	27 10	23 10
At high water ordinary neap tides	23 10	19 10
At low water ordinary neap tides	9 10	5 10
At low water ordinary spring tides	6 6	2
Depth of Thames Conservancy proposed channel:		
At low water ordinary spring tides	12 0	-
Depth of water less at toe of side walls by	11 0	7 0
Quays above Trinity high water	-	6 0

Side walls curved.  
Invert curved.

For the effective depth for modern ships the following reductions will have to be made from the depth of

water at centre of sills owing to the curve of the walls and invert.

	Ft.	In.
For ships with 30 feet beam - - -	3	6
For ships with 35 feet beam - - -	5	0
For ships with 40 feet beam - - -	9	0

## BASIN.

	A.	R.	P.
Area - - - - -	2	0	0
Width - - - - -	200		
Depth of water at Trinity high water -	24		0
Depth of water at high water ordinary neap tides - - -	20		0

Water level is not raised by pumping.

## WEST PASSAGE.—Cross Section.

(One pair of gates.

	Ft.	In.
Width at coping - - - - -	45	0
Width at invert - - - - -	40	0

Depth of water on centre of sill:—

At Trinity high water - - - - -	23	10
At high water ordinary neap tide - - -	19	10
Depth of water less at toe of side walls by - - - - -	10	0

Side walls curved.  
Invert curved.

For the effective depth of modern ships the same reduction will have to be made from the depth of water at centre of sill as in the case of the entrance lock.

## WEST DOCK.

	A.	R.	P.
Area - - - - -	3	3	35
Depth of water at Trinity high water -	24		0
Depth of water at high water ordinary neap tides - - -	20		0

Water level is not raised by pumping.

## EAST PASSAGE.—Cross Section.

One pair of gates.

	Ft.	In.
Width at coping - - - - -	45	0
Width at invert - - - - -	40	0

5823

Depth of water on centre of sill:—

	Ft.	In.
At Trinity high water - - - - -	23	10
At high water ordinary neap tides - - -	19	10
Depth of water less at toe of side walls by - - - - -	10	0

Side walls curved.  
Invert curved.

For the effective depth for modern ships the same reduction will have to be made from the depth of water at centre of sill as in the case of the entrance lock.

## EAST DOCK.

	A.	R.	P.
Area - - - - -	4	1	2
Depth of water at Trinity high water -	24		0
Depth of water at high water ordinary neap tides - - -	20		0

Water level is not raised by pumping.

## PUMPING.

There is no provision for raising the water level in the basin or docks by pumping or otherwise, and the water level depends on the amount of locking that takes place between the time of spring tides and neap tides.

## POWER.

New pumping engines have been erected near the St. Katharine entrance lock to supply hydraulic power. The Hydraulic Power Company previously supplied the Dock Company with power.

Some private firms are putting up wall cranes on the warehouses they occupy, and taking the hydraulic power by meter from the Dock Company.

There are fifty-five hydraulic cranes, but many of them are of an obsolete type.

There are 6 hydraulic jiggers.

There are 27 hand cranes.

There are 14 hand jiggers.

There are 21 warehouse lifts worked by hydraulic power.

The lock gates and the gates at the passages are worked by chains, the power being hand power.

The bridge is worked by hydraulic power.

## RAILWAYS.

None.

## ROADS.

About 2 miles.

## GENERAL.

The docks are only capable of accommodating the smaller coasting vessels and barges, the lock is only capable of dealing with barges, the vessels mostly coming in on a level. Before vessels can leave the docks, they require the Tower Bridge opened as they come out of dock stern first on the flood tide, and drop up stream; this could only be remedied by joining these docks to the London Docks. The longest ship of the Clyde Shipping Company is about 260 feet long, and can only enter on the level, and then only to the East Dock with the greatest difficulty. These docks and warehouses would form, were they set apart for the purpose, an ideal granary fed from barges.

## B.—THE ST. KATHARINE DOCKS.

## WAREHOUSES AND TRANSIT SHEDS.

The St. Katharine Docks are almost entirely surrounded by lofty warehouses coming out to the face of the dock walls, the front being carried on cast-iron columns having a quay space beneath.

The storage capacity of the warehouses is estimated at 86,000 tons.

The floor area of the warehouses is estimated at 1,655,000 square feet.

Appendix.

D.  
continued.

BONDED WAREHOUSE A.—Cross Section.

A seven story brick building, partly occupied by the General Steam Navigation Company, including jetty, and partly in the Dock Company's hands as a tea, indigo, and general cargo warehouse. The back of the warehouse abuts on Little Thames Street.

BONDED WAREHOUSE B.—Cross Section.

A seven story brick building in the Dock Company's hands as a tea, indigo, and general warehouse. The back of the warehouse abuts on Little Tower Hill.

GENERAL OFFICE.

Partly occupied by Messrs. Compton and Sons, and partly by the Dock Company as offices.

BONDED WAREHOUSE C.—Cross Section.

A seven story brick building, partly occupied by the Algo Steamship Company, and partly as a general warehouse in the Dock Company's hands.

BONDED WAREHOUSE D.—Cross Section.

Appendix.  
D.  
continued.

A seven story brick building, partly occupied by the Clyde Shipping Company, partly by Messrs. J. and J. Lonsdale and Co., Limited, and partly as a general warehouse in the Dock Company's hands. Part of this warehouse abuts on Upper East Smithfield.

BONDED WAREHOUSE E.—Cross Section

A seven story brick building, partly occupied by the Clyde Shipping Company, and partly as a wool warehouse in the Dock Company's hands. The back of this warehouse abuts on Nightingale Lane, and is connected by a bridge with the London Dock.

BONDED WAREHOUSE F.—Cross Section.

An eight story brick building, partly occupied by the Algo Steamship Company and another, and partly as a wool and general warehouse in the Dock Company's hands. Part of this warehouse abuts on Nightingale Lane, and is connected by a bridge with the London Docks.

## Appendix

## WAREHOUSE G.

continued. D. A four story brick building, occupied partly by the Apollinaris Company, Limited, and as a wool warehouse in the Dock Company's hands.

WAREHOUSE H.—Cross Section.

A four story brick building, occupied by the Apollinaris Company, Ltd., and abuts at the back on Lower East Smithfield.

## BONDED WAREHOUSE I.

A four and five story brick building, occupied partly by the Haller Line, partly by Gordon and Dilbuthes Oatsup, Limited, and partly as a scent warehouse in the Dock Company's hands.

West of Warehouse I., the London and Tilbury Lighterage Contracting and Dredging Company, Limited, have a shoot for the discharge of rubbish into barges.

CROSS SECTION, NORTH AND SOUTH.

CROSS SECTION, EAST AND WEST.

The space east of the Basin marked on the maps "Wool Wharf" is occupied by a one story iron shed used by marble import firms.

## VAULTS.

The wine and oil storage vaults are estimated of a capacity of 37,500 pipes. They extend under warehouses A, B, C, D, E, F, and I.

From the foregoing the position of the warehouses relatively to the quays can be seen.

Should it be desirable to widen the quays it could be carried out by introducing columns and girders under the warehouses.

Invert curved.		

**Pumping.**  
The pumps at the Shadwell entrance and at the Shadwell Old Basin raise the water level in the Hermitage Basin, the Western Dock, the Tobacco Dock, and the Eastern Dock, 3 feet 6 inches. The Wapping Basin, the Shadwell Old Basin, and the Shadwell New Basin have no provision for raising the water level; but the level of water in these latter depends on the amount of locking taking place between the time of spring tides and the time of neap tides.

**Power.**  
Chiefly hydraulic; the power coming from the engines at St. Katharine's Docks entrance, which seems to be too far away to get good results without a thorough overhauling of the pipe system. The power from the Hydraulic Power Company has still to be drawn on to assist the Dock Company's engines. There are 118 hydraulic cranes, but many of them are of an obsolete type. There are 18 hydraulic jiggers. There are 15 hand cranes. There are 12 hand delivery jiggers. There are 22 warehouse lifts worked by hydraulic power. The lock gates at the Shadwell Lower Entrance Lock and the Inner Lock, Shadwell Basin, are worked by chains, the power being hydraulic. Four of the swing bridges are also worked by hydraulic power; the other gates and bridges are worked by hand.

**Railways.**  
None.  
**Roads.**  
About six miles.  
**General.**

The passages at the Tobacco Dock greatly limit the size of vessels that can use the Western Dock, and I have seen that dock without a ship in it. There is some rule or law preventing more than two entrances to be maintained in use, but it would facilitate traffic if an entrance could be set apart for barges only, with power to confine them to the use of that entrance.

**B.—THE LONDON DOCKS.**  
**WAREHOUSES AND TRANSIT SHEDS.**  
These docks are the centre of the wool trade, special provision having been made for lighting some of the

top floors of the warehouses, and reserving them as show and sale rooms.

The storage capacity of the warehouses is estimated at 174,000 tons.

The floor area of the warehouses is estimated at 3,092,700 square feet.

#### HERMITAGE BASIN.

Wooden sheds, occupied by Messrs. Thomas Ronaldson and Company, Limited.

Brick warehouse, abutting on Nightingale Lane, occupied by the Dock Company as their stores.

#### WAPPING BASIN.

The Dock Company's shops, a one story brick shed situated on the south-east side.

Ice ships discharge into barges at north-east corner crane.

The two story timber shed on the west side is occupied by Messrs. John Allen and Company.

The brick warehouse on the west, abutting on Red Mead Lane, is partly occupied by Messrs. John Allen and Company, the Dock Company, and Messrs. William Oliver and Company.

#### INNER LOCK, WAPPING BASIN.

The timber one story shed on east side is occupied by the Dock Company.

The timber one story shed on the west side is occupied by the Dock Company.

#### WESTERN DOCK.

##### NORTH QUAY.

At the west end is a two story iron transit shed, occupied by the Dock Company.

Cross Section.

Along the North Quay, in continuation of the iron transit shed, but of smaller dimensions, run one story timber sheds, partly used as Custom House Offices and partly as transit sheds in the Dock Company's occupation for general goods.

#### BONDED WAREHOUSE.—No. 1.

A four story brick building, occupied by the Dock Company for general goods.

#### BONDED WAREHOUSE.—No. 2.

A four story brick building, occupied by the Dock Company for drugs.

#### BONDED WAREHOUSE.—No. 3.

A four story brick building, occupied by the Dock Company for fruit and wool.

#### BONDED WAREHOUSE.—No. 4.

A four story brick building, occupied by the Dock Company for fruit and wool.

#### BONDED WAREHOUSE.—No. 5.

A four story brick building, occupied by the Dock Company for pepper and wool.

Along Pennington Street, commencing at the east.

A one story brick warehouse, marked "Cair Warehouse," occupied by the Dock Company for wool, gums, and general goods.

A one story brick warehouse, marked "Drug Ware-

house," occupied by the Dock Company for general goods.

A one story brick warehouse, marked "Drug Warehouse," occupied by the Dock Company for general goods.

A one story brick warehouse, marked "Drug Warehouse," occupied by the Dock Company for general goods.

A four story brick warehouse, marked "Wool Warehouse," occupied by the Dock Company for wool and gum.

A four story large brick warehouse, marked "Wool Warehouse," facing end of George Street, occupied by the Dock Company for wool and wool show rooms.

A four story large brick warehouse, marked "Wine Warehouse," facing end of Well Street, occupied by the Dock Company for wool and wool show rooms.

A four story large brick warehouse, marked "Wool Warehouse," facing end of Dock Street, occupied by the Dock Company for wool and wool show rooms.

#### WEST QUAY.

##### BONDED WAREHOUSE.—No. 6.

A four story brick building, occupied by the Dock Company for ivory, spices, and bark.

##### WEST QUAY WAREHOUSE.

A five story brick building with its front on dock wall, supported on iron columns, being part of Nos. 7 and 8 warehouses.

##### BONDED WAREHOUSE.—No 7.

A five story brick building, with a bridge to St. Katharine's Docks, occupied by the Dock Company for wool.

Appendix.  
D.  
continued.

Appendix.

D.  
continued.

## BONDED WAREHOUSE.—No. 8.—Cross Section.

A three story brick building, occupied by the Dock Company for wool.

## BONDED WAREHOUSE.—No. 9.—Cross Section.

A six story brick building, with a bridge over Nightingale Lane to St. Katharine's Docks, occupied by the Dock Company for Wool; basement, tallow.

## TRANSIT SHED.—No. 9.

A wooden one story building, occupied by the Dock Company for general goods.

## TRANSIT SHED ON EXPORT JETTY.

An iron and wooden shed, occupied by the Dock Company for general exports.

## SOUTH QUAY.

## TRANSIT SHED ON SOUTH QUAY.—Cross Section.

A one story wooden shed, occupied by the Dock Company, at the west end, for general goods. The east end, occupied by Messrs. Forwood Brothers and Company.

SOUTH QUAY WAREHOUSE.

Appendix.  
D.  
continued.

A four story brick building, with the west end abutting on Red Mead Lane ; ground floor, east end occupied by Messrs. Forwood Brothers and Company, the remainder by the Dock Company for general goods. The west end is the bottling and vat shed.

EAST QUAY.

East Quay Warehouses.—Cross Section.

A one story large brick and wood building occupied by the Dock Company for fruit, wool, and sugar.

TOBACCO DOCK.—Cross Section.

Warehouse on North Wall.

A one story brick and wooden building, occupied by the Dock Company for low wools and skins.

Bonded Warehouses on South Side, with back abutting on Worcester Street.

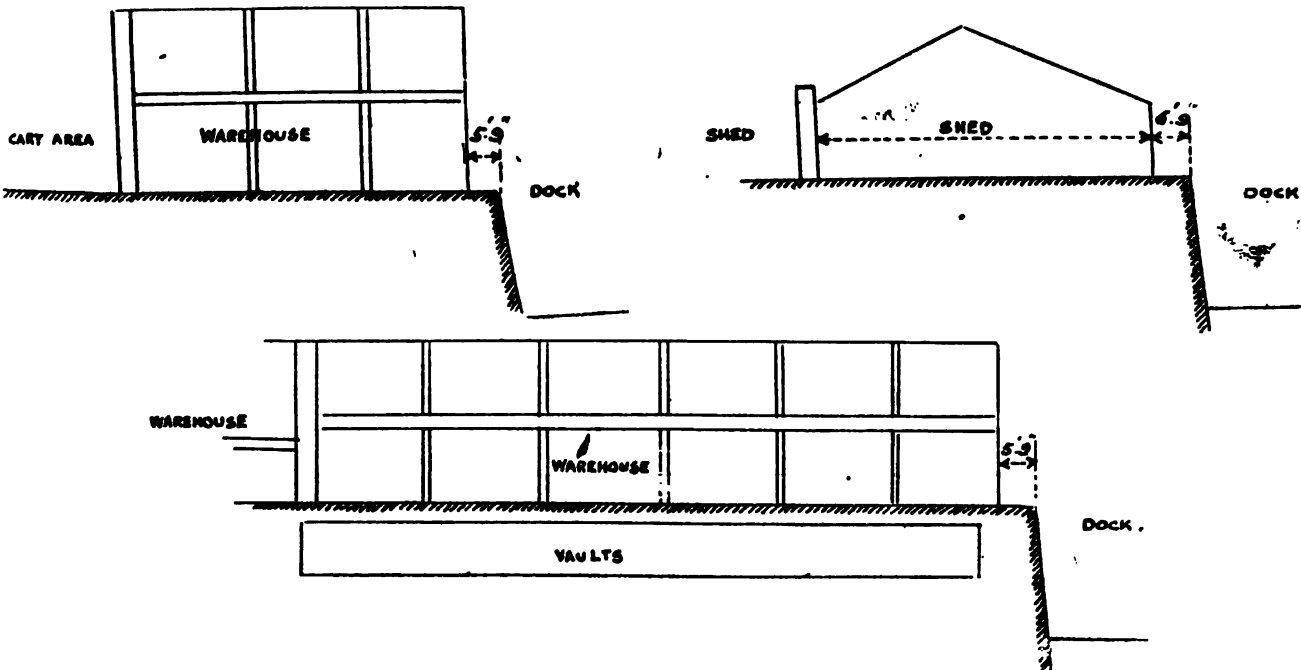

One and two story brick buildings, occupied by the Dock Company for sugar and fibres.

EASTERN DOCK.

A wooden warehouse abutting on West Gardens. A one story building, occupied by the Dock Company for fibres.

Warehouses on North, North-west, and North-east sides, coming within 5ft. 9in. of the dock wall—one and two story buildings.

Cross Sections.

North occupied by Messrs. James Hartley and Co ; East by Messrs. Cheesewright and Ford and the London and Channel Islands Steamship Co., Limited; and West by the Dock Company as a sugar warehouse. Brick warehouse corner of West Gardens and New Gravel Lane, occupied by Messrs. Lipton, Limited.

Appendix.

D.  
continued.

## WEST QUAY.

## BONDED WAREHOUSE.—No. 10.

A five story brick building, occupied by the Dock Company for cocoa, coffee, and fruit.

## SOUTH QUAY.—Cross Section.

At West of South Quay a two story brick warehouse, with top story level with quay, occupied by the dock company's coffee husking plant and engines; the eastern end being one story, used for general goods.

The one and two story timber warehouse at the south-east corner is occupied by the Dock Company for fibre.

The one story timber warehouses situated between

the Inner Locks from the Shadwell Basins are occupied by the Dock Company, the western one for fibre, the east one for frozen meat being landed from barges into Dock Company's special vans.

The one story timber warehouse situated between the Entrance Locks to the Shadwell Basins is occupied by Messrs. D. C. Thomas and Sons.

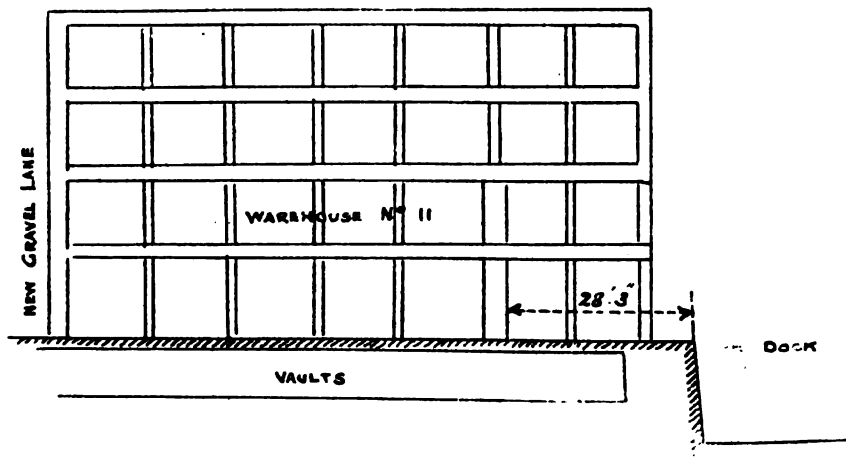

## SHADWELL NEW BASIN.

## WEST QUAY.

## BONDED WAREHOUSE.—No. 11.

A four story brick building, with the front on dock wall and back abutting on New Gravel Lane, occupied by the Dock Company for sugar.

## Cross Section.

## NORTH QUAY.

On the north side are one story wooden and iron sheds, occupied by the Dock Company for the discharge of sugar, wool and general goods.

## Cross Section.

EAST QUAY.

On the east side are one and two story wooden and iron sheds, occupied by Messrs. Fisher, Renwick and Co., of Manchester.

Cross Section.

VAULTS.

The wine and oil storage vaults are estimated of a capacity of 83,500 pipes.

They extend under warehouses Nos. 6, 7, 8, and 9; under the warehouses next Upper East Smithfield and Pennington Street, and warehouses Nos. 1, 2, 3, 4, and 5; under warehouses north of Tobacco Dock; under sugar warehouse on west, north, and east of Eastern Dock; and under Messrs. Lipton, Limited; under south side of Tobacco Dock; under East Quay warehouses; and under South Warehouse, South Quay of Western Dock.

From the foregoing the position of the warehouses relatively to the quays can be seen.

Should it be desirable to widen the quays it could be carried out by introducing columns and girders under the warehouses.

## Pumping.

The water level of the dock and the Regent's Canal are maintained by pumping, the power house is situated in the old Ship Lock. The canal has now been rendered by the pumping arrangements quite independent of the reservoirs.

## Power.

Hydraulic.—The power house is built in the old Ship Lock.

There are 32 Hydraulic cranes chiefly on the coal transhipment jetties.

There are no hand cranes.

The Lock Gates are worked by chains, the power being hydraulic.

The Regent's Canal locks are worked by an hydraulic capstan.

## Railways.

None.

## Roads.

Round North, East and South East Quays.

## General.

This dock is the inlet to the Regent's Canal up which a great deal of the cargoes are taken after being transhipped into barges.

The transhipment of coal forms a large portion of the trade.

## B.—THE LIMEHOUSE DOCK.

## WAREHOUSES AND TRANSIT SHEDS.

The Victoria Wharf Warehouse is situated on the river front east of the Ship Lock, and is in the Dock Company's occupation for general goods.

The West Transit Shed South Quay is chiefly used by South Wales boats for general cargo.

The East Transit Shed South Quay is occupied by the Dock Company for general goods, wool, cocoanuts, lamp glasses, etc.

The Warehouse at corner of Horseferry-road and Harrow Street is let on lease to Stuart's Granolithic Stone Company, Ltd.

## NORTH QUAY.—Cross Section.

From the foregoing cross section the position of the Warehouse relatively to the Quay can be seen.

## Transit sheds.

Fair.

This dock is in a good state of repair, and additional machinery for expediting the working of the locks is being fixed.

## A. 4.—THE MILLWALL DOCKS.

The entrance lock of the Millwall Docks is situated 3m. 4f. 3chns. below London Bridge on the north side of the River Thames.

The depth of water at the centre of the River Thames opposite this entrance is:—

	Ft. In.
At high water ordinary spring tides	- 32 4
At Trinity high water	- 31 4
At high water ordinary neap tides	- 27 4
At low water ordinary neap tides	- 13 4
At high water ordinary spring tides	- 10 0

Depth of Thames Conservancy proposed channel:—

	Ft. In.
At low water ordinary spring tides	- 18 0

The depth of water over the Blackwall Tunnel which passes under the bed of the river further down, is at low water ordinary spring tides 17 feet, leaving a depth of material above the extrados of the tunnel of about 14 feet 8 inches. The Thames Conservancy proposed channel only lessens this by one foot.

## ENTRANCE LOCK.—Cross Section.

	Ft. In.
Length between outer and inner gates	- 450 0
Divided by middle gates into 250ft. and 200	0
	Ft. In.
Deduct for swing of gates, etc.	- say 20 0
Width at coping	- 80 0
Width at invert	- 80 0

Depth of water on centre of sill:—

At high water ordinary spring tides	- 28 7
At Trinity high water	- 27 7
At high water ordinary neap tides	- 23 7
At low water ordinary neap tides	- 9 7
At low water ordinary spring tides	- 6 3

Depth of Thames Conservancy proposed channel:—

	Ft. In.
At low water ordinary spring tides	- 18 0
Depth of water less at toe of side walls by	- 5 0
Quay above Trinity high water	- 4 5
Side walls plumb.	
Invert curved.	

The Elder Dempster Line of Steamers, 470 feet in length and 56 feet in breadth (See Questions No. 978 and No. 1033), must pass in and out on the level, and draw at least 2 feet 6 inches less than the depth of water on centre of sill, owing to the curve of the invert.

## OUTER DOCK.

	A. R. P.
Area	- 25 2 0
	Ft. In.
Width	- 350 0
Depth of water at centre of Trinity high water	- 28 0
Depth of water next walls at Trinity high water	- 24 0
Water level is raised by pumping	- 1 6

The quay level was formerly 4 feet above Trinity high water, but under the Floods Prevention Act it had to be raised 1 foot 6 inches, or to 5 feet 6 inches above Trinity high water.

## Appendix.

D.  
continued.

## PASSAGE TO INNER DOCK.—Cross Section.

	Ft.	In.
Width at coping - - - - -	80	0
Width at toe of walls - - - -	80	0
Depth at centre at Trinity high water -	28	0
Depth at toe of side walls at Trinity high water -	28	0
Water level is raised by pumping -	1	6
Walls plumb.		
Invert none.		

## INNER DOCK.

	A. R. P.	Ft.	In.
Area - - - - -	10	0	0
Width - - - - -		350	0
Depth of water at centre at Trinity high water -		28	0
Depth of water next walls at Trinity high water -		24	0
Water level is raised by pumping -		1	6
Quay level above Trinity high water -		5	6

## Rumping.

There are two water wheels used for raising the water level in the docks, the engine house being situated at the Entrance Lock.

## Power.

Chiefly hydraulic.  
There are 65 hydraulic cranes.  
There is one hand crane.  
There are 12 hydraulic jiggers.  
There are 50 hydraulic lifts in the warehouses.  
There is an 80-ton sheer legs.  
The Entrance Lock gates are worked by chains by hydraulic power.  
The swing bridge at lock and the rolling bridge at passage are worked by hydraulic power.  
Electric power is used on the timber roller tracks, which are a special feature of these docks.

## Railways.

There are 50 miles of single line—access from Millwall Extension Railway.

## Roads.

Round the docks and to the sheds.

## General.

These docks have been much neglected, and are dependent on one entrance only. An Equipment Company is now spending £200,000 on a new granary and new timber installation.

## B.—THE MILLWALL DOCKS.

## WAREHOUSES AND TRANSIT SHEDS.

There are no bonded warehouses.  
The sheds consist of one story brick and iron buildings, which, in some cases, have had a second floor erected inside them.

## OUTER DOCK.

## NORTH QUAY.

Shed A, occupied by the Dock Company for general goods.  
Shed A 2, occupied by the Dock Company for wood.  
Shed A 3, occupied by Keg and Drum Company for making of same.  
Shed B, occupied by McAndrew Brothers, Spanish merchants.  
Shed B 2, occupied by the Dock Company for wood and paper.  
Shed B 3, occupied by the Dock Company for wooden mouldings.  
Shed C, occupied by the Dock Company for general goods.  
Shed C 2, occupied by the Dock Company for paper and grain.  
Shed D, occupied by the Dock Company for general goods.

## Cross Section.

Shed D 2, occupied by the Dock Company for general goods.  
Shed D 3, occupied by the Dock Company for grain and general goods.  
Shed E, occupied by the Dock Company for general goods.  
Shed No. 1, occupied by the Dock Company for grain and general goods.

Shed No. 2, occupied by the Dock Company for grain and general goods.  
Shed No. 3, occupied by the Dock Company for grain and general goods.  
Shed No. 4, occupied by the Dock Company for export goods and fruit.  
Shed No. 5, occupied by the Dock Company for export goods and fruit.

SOUTH QUAY.

Shed Z, occupied by the Dock Company for exports and general goods.  
Shed X, occupied by the Dock Company for general Baltic goods.

Shed W, occupied by the Dock Company for general Baltic goods.  
Shed V, occupied by the Dock Company for general Baltic goods.

Appendix.  
D.

Cross Section.

Shed T, occupied by the Dock Company for general Baltic goods.  
Shed T 2, occupied by the Dock Company for general Australian goods.  
Shed S, occupied by the Dock Company for oil cake.

Shed P, occupied by the Dock Company for exports and general goods.  
Shed P 2, occupied by the Dock Company for wood.  
Shed O, occupied by the Dock Company for wood.

INNER DOCK.

WEST QUAY.

Shed Q, occupied by S. Priday for furniture wood.  
Shed R, occupied by the Dock Company for nitrate of soda.

Shed No. 6, occupied by the Dock Company for grain.  
Shed No. 7, occupied by the Dock Company for grain.  
Shed F, occupied by the Dock Company for grain.

Cross Section.

Shed F 2, occupied by the Dock Company for sack store.  
Shed G, occupied by the Dock Company for Montreal cargoes. North of Shed G is the site for new granary.

Shed J 2, occupied by the Dock Company for wood. Eastern granary is in front of J 2.  
Shed K, occupied by the Dock Company for general goods in transit.  
Shed L, occupied by the Dock Company for general goods in transit.  
Shed M, occupied by the Dock Company for general Cuba cargoes.

EAST QUAY.

Shed J, occupied by the Dock Company for grain.

Cross Section.

Shed M 2, occupied by Agricultural Organising Agency.  
Old Millwall Athletic Ground and Company's ground adjoining is being laid out as a timber yard with live roller conveyors from the south-east corner of Inner Dock and from the front of the Great Eastern Railway Wharf Outer Dock.

From the foregoing Cross Sections the position of the Sheds relatively to the Quays can be seen.

The depth of water at the centre of the River Thames opposite the South West India Blackwall entrance:—

	Ft.	In.
At high water ordinary spring tides	38	4
At Trinity high water	37	4
At high water ordinary neap tides	33	4
At low water ordinary neap tides	19	4
At low water ordinary spring tides	16	0

Depth of Thames Conservancy proposed channel:—

	Ft.	In.
At low water ordinary spring tides	18	0

The depth of water over the Blackwall Tunnel which passes under the bed of the river further down, is at low water ordinary spring tides 17 feet, leaving a depth of material above the extrados of the arch of the tunnel of about 14 feet 8 inches. The Thames Conservancy proposed channel only lessens this by one foot.

Pumping.

The water in the Blackwall Basin, the West India Import Dock, the West India Export Dock, and the Limehouse Basin is raised by pumping to 1 foot 6 inches above Trinity high water level; and the same can be done when necessary to the Junction Dock, the South Dock Basin, and the South West India Dock. The pumping station is situated near Blackwall entrance.

Power.

Chiefly hydraulic.

There are 60 hydraulic cranes.  
There is one electric crane.  
There are 23 steam cranes.  
There is 1 20-ton floating crane.  
There is 1 6-ton floating crane.  
There are 120 hand cranes.  
There are 23 electric travellers.  
There are 29 hydraulic jiggers.  
The warehouses have hydraulic lifts back and front.  
The gates at the Blackwall West India Entrance Lock are worked by hydraulic rams, all other gates by chains and hydraulic power, with the exception of the

Appendix. locks out of the Limehouse Basin to the docks, which are worked by hand.

D. The swing bridges have hydraulic power, with the exception of those at the inner end of the Limehouse Basin, which are worked by hand.

#### Railways.

About 12 miles of single line, connecting with the outside railway system.

#### Roads.

About 4½ miles.

#### General.

These docks, the oldest in London, are greatly hampered by the Millwall Railway passing over all the passages at their eastern end. There seems to be some rule or law preventing more than two entrances being maintained in use, but it would facilitate traffic if an entrance could be set apart for barges only, with power to confine them to the use of that entrance.

### B.—THE WEST INDIA DOCKS.

#### WAREHOUSES AND TRANSIT SHEDS.

The storage capacity of the warehouses and sheds is estimated at 180,000 tons.

The floor area of the warehouses and sheds is estimated at 4,378,000 square feet.

#### LIMEHOUSE BASIN.

Used for vessels and craft lying up or repairing, and for landing wood.

#### WEST INDIA IMPORT DOCK.

##### NORTH QUAY.

Warehouses four to six story, with basements.

No. 1 Warehouse, burnt.

No. 2 Bonded Warehouse, ground floor let to Messrs. Simpson, Spence and Young; the basement and other floors in the Dock Company's occupation for general goods.

No. 2 Shed.—A one story brick building let to Messrs. Simpson, Spence and Young.

No. 3 Bonded Warehouse.—Ground floor let to Messrs. Simpson, Spence and Young; the basement and other floors in the Dock Company's occupation for general goods.

No. 4 Bonded Warehouse.—In the Dock Company's occupation for general goods.

Cross Section.

No. 5 Bonded Warehouse.—The ground floor and basement in the Dock Company's occupation for general goods; the upper portion is the Dock Company's cold storage, capable of taking 100,000 sheep. At back is the engine house for cold storage and the electric light station.

No. 6 Bonded Warehouse.—Ground floor let to Messrs. Williams, Torry and Field (Atlantic Transport Company); the basement and other floors in the Dock Company's occupation for general goods.

No. 7 Bonded Warehouse.—In the Dock Company's occupation for furniture wood and general goods.

No. 8 Bonded Warehouse.—In the Dock Company's occupation for furniture wood and general goods.

In front of the foregoing bonded warehouses, but separated from them by a cart road, runs a wooden shelter shed for the whole length of the North Quay.

The foregoing bonded warehouses are substantial brick buildings, but of an obsolete type, and would,

with great advantage, be removed and replaced by two story transit sheds, running from the front of shelter shed next to quay to the Dock Company's boundary wall, having hatchways in the top floor over the cart roads and railroads.

There is a line of rails from the east along the back of the foregoing bonded warehouses.

##### EAST QUAY.

No. 10 Warehouse, with a wooden shelter shed in front, is a three-story brick building, occupied by the Admiralty as a Royal Naval Store.

##### WEST QUAY.

No. 11 Bonded Warehouse, a four story brick building, with a wooden shelter shed in front, occupied by the Dock Company for general imports and exports.

Cross Section.

SOUTH QUAY.

No. 12 Bonded Warehouse, a three story brick building, occupied by the Dock Company for general goods.

No. 1 Bonded Shed, a one story brick building, occupied by the Dock Company for the storage of rum.  
No. 2 Bonded Shed, a one story brick building occupied by the Dock Company for the storage of rum.

Appendix.  
D.  
continued.

Cross Section.

East Bonded Rum Shed, a one story brick building, occupied by the Dock Company for the storage of rum.

WEST INDIA EXPORT DOCK.

NORTH QUAY.

West Bonded Rum Shed, a one story brick building, occupied by the Dock Company for the storage of rum.

No. 1 Export Shed, a one story wooden building, occupied by the Dock Company as a furniture wood store.

In front of the foregoing sheds runs an iron bonded shelter shed, occupied by the Dock Company for the storage of rum.

No. 2 Export Shed, a one story wooden building, occupied by the Dock Company as a furniture wood store.

West Furniture Wood Sheds, a one story wooden building, occupied by the Dock Company for the storage of furniture wood.

No. 3 Export Shed, a one story wooden building, occupied by the Dock Company as a furniture wood shed.

No. 4 Export Shed, a one story wooden building, occupied by the Dock Company as a furniture wood store.

East Furniture Wood Sheds, Nos. 1 to 11, one story wooden buildings, occupied by the Dock Company for the storage of furniture wood. These sheds have electric overhead travellers for the handling of the timber.

WEST QUAY.

Wooden one story sheds abutting at back on Bridge Road, occupied by the Dock Company as a furniture wood store.

Cross Section

EAST QUAY.

Nos. 12 to 21, wooden one story sheds, occupied by the Dock Company as a furniture wood store. These sheds have electric overhead travellers for the handling of timber.

Cross Section.

QUAY BETWEEN WEST INDIA EXPORT DOCK AND SOUTH-WEST INDIA DOCK.

Cross Section.

No. 1 Shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 1A Shed, a one story wooden building, occupied by the Dock Company as a general export shed.

## Appendix.

continued.

No. 2 Shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 2A Shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 3 Shed, a one story wooden building, occupied by the Dock Company as a general export shed.

No. 3A Shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 4 Shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 5 Shed, a one story wooden building, occupied by the Dock Company as a general export shed.

No. 5A Shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 6 Shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 7 Shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 7A Shed, a one story wooden building, occupied by the Dock Company as a general export shed.

No. 8 Shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 8A shed, a one story brick building, occupied by the Dock Company as a general export shed.

No. 9 Shed, a one story part brick and part wooden building, occupied by the Dock Company as a general export shed.

No. 10 Shed, a one story brick building, occupied by the Dock Company as a general export shed.

## SOUTH WEST INDIA DOCK.—Cross Section.

## SOUTH QUAY.

No. 1 to No. 23, two story brick warehouses, occupied by the Dock Company for general goods.

No. 1 Warehouse is used for frozen meat.

No. 14 Shed, a one story wooden building, occupied by the Dock Company as a general export shed.

Iron Shed, a one story building in front of the east block of warehouses, occupied by the Dock Company for general goods.

Wooden Shed, a one story building in front of the west block of warehouses, occupied by the Dock Company for general goods.

No. 15 Shed, a one story wooden building, occupied by the Dock Company for the storage of furniture wood.

No. 16 Shed, burnt.

No. 17 Shed, a one story wooden building, occupied by the Eastern Telegraph Company.

## WEST QUAY.

A one story brick building, occupied by Messrs. Scrutton, Sons and Company.

## EAST QUAY.

H.M. Ship "President," and wooden drill shed.

## JUNCTION DOCK.

## Cross Section of East Quay.

Teak Sheds at east side, one story wooden buildings, with electric overhead travellers for the handling of logs, occupied by the Dock Company.

## Cross Section of West Quay.

SOUTH DOCK BASIN.  
SOUTH QUAY.—Cross Section.

No. 13 Shed, a one story wooden building, with cover in front, occupied by the Dock Company.

No. 13A Shed, a one story wooden building, occupied by the Dock Company.

Front Shed at east end, a one story wooden building, occupied by the Dock Company.

Back Shed at east end, a one story wooden building, occupied by the Dock Company.

#### Vaults.

There are storage vaults of the estimated capacity of 24,000 pipes.

They extend under the warehouses of the North, East, and South Quays of the West India Import Dock.

From the foregoing Cross Sections the position of the warehouses relatively to the Quays can be seen.

I estimate the sum of £45,000 is required to be spent to bring the docks up to a good state of repair, besides the annual up-keep. This sum does not include any amount for new cranes or works to render the docks more fit for modern requirements. (Carried to Summary.)

### A. 6.—THE EAST INDIA DOCKS.

The entrance locks to the East India Docks are situated, upper, 6m. 5f. 3chs., lower, 6m. 5f. 8chs. below London Bridge, on the north side of the River Thames.

The depth of water at the centre of the River Thames opposite these entrances is:—

	Ft.	In.
At high water ordinary spring tides	37	4
At Trinity high water	36	4
At high water ordinary neap tides	32	4
At low water ordinary neap tides	18	4
At low water ordinary spring tides	15	0

Depth of Thames Conservancy proposed channel:—

	Ft.	In.
At low water ordinary spring tides	18	0

A. R. P.

Area inside Dock Company's boundaries, including Blackwall Station	71	0	0
Dock Company's property not included above			Nil.
Water area	33	0	0

### EAST INDIA DOCKS.

## EAST INDIA IMPORT DOCK.

	A.	R.	P.
Area	17	1	0
Width	536	0	
Depth of water at Trinity high water	26	0	
Water level is not raised by pumping.			
North, South, and East Quay above Trinity high water	8	0	
West Quay above Trinity high water	6	0	

A false quay has been constructed on the south side of this dock. It consists of timber piles with an iron and concrete top.

## PASSAGE FROM BASIN TO EXPORT DOCK.—Cross Section.]

One pair of gates.

	Ft.	In.
Width at coping - - - - -	60	0
Width at invert - - - - -	60	0
Depth of water on centre of sill:—		
At Trinity high water - - - - -	30	0
At high water ordinary neap tides - - - - -	26	0
Depth of water same at toe of side walls.		
Quay above Trinity high water - - - - -	4	6
Side walls plumb.		
Invert flat.		

There are 19 jiggers.

The basin warehouses have 12 hydraulic lifts.

The lower entrance lock gates and the passage gates into the Export Dock are worked by hydraulic rams, and the inner lock to the Import Dock by chains worked by hand.

The swing bridge is worked by hydraulic power.

## RAILWAYS.

On the North Quay of the Export Dock and Basin about 0.75 miles of single line, connecting with the outside railway system.

## ROADS.

About 2 miles.

## GENERAL.

The locks being too short, and the basins being too narrow to enable them to be lengthened, ships and barges have to be worked in and out on the level. The largest ships of the Union Castle Line cannot use these docks.

## B.—THE EAST INDIA DOCKS.

## WAREHOUSES AND TRANSIT SHEDS.

The storage capacity of the warehouses and sheds is estimated at 32,800 tons.

The floor area of the warehouses and sheds is estimated at 871,200 square feet.

## EAST INDIA DOCK BASIN.

## EAST QUAY.

Three story brick warehouses in occupation of the Dock Company, but appropriated to the Union Castle Line for exports.

## OLD PASSAGE FROM BASIN TO EXPORT DOCK (Closed).

A fixed bridge now passes over this passage.

## EAST INDIA EXPORT DOCK.

	A.	R.	P.
Area - - - - -	8	0	0
		Ft.	In.
Width - - - - -	436	0	
Depth of water at Trinity high water - - - - -	26	10	
Water level is not raised by pumping.			
Quay above Trinity high water - - - - -	6	0	

A false quay has been constructed on the north side of this dock, it consists of timber piles with an iron and concrete top.

## PUMPING.

There is no provision for raising the water level in the basin or docks by pumping, so the water level depends on the amount of locking that takes place between the time of spring tides and neap tides.

## POWER.

Chiefly hydraulic.

There are 30 hydraulic cranes.

There are 51 hand cranes.

## Cross Section.

## NORTH QUAY.

Three story brick warehouse in occupation of the Dock Company, but appropriated to the Union Castle Line for imports.

Appendix.

D.  
continued.

The shed next the inner lock, No. 1 warehouse, shed in front of No. 2 and No. 3 warehouses, and the shed between No. 3 and No. 4 warehouses, have been destroyed by fire. The Dock Company are replacing them with a one story ferro concrete warehouse.

No. 4 Bonded Warehouse.—A two story brick building, occupied by the Dock Company as a furniture, wood and wool store.

No. 5 Bonded Warehouse.—A two story brick building, occupied by the Dock Company as a furniture wood and wool store.

Shed in front of No. 4 and No. 5 warehouses. A one story wooden building, occupied by the Dock Company.

No. 6 Bonded Warehouse.—A two story brick building, occupied by the Dock Company as a furniture wood and wool store.

No. 7 Bonded Warehouse.—A two story brick building, occupied by the Dock Company as a furniture wood and wool store.

Shed in front and at side of No. 6 and No. 7 warehouses. A one story wooden building, occupied by the Dock Company.

No. 8 Bonded Warehouse.—A three story brick building, occupied by the Dock Company as a furniture wood and wool store.

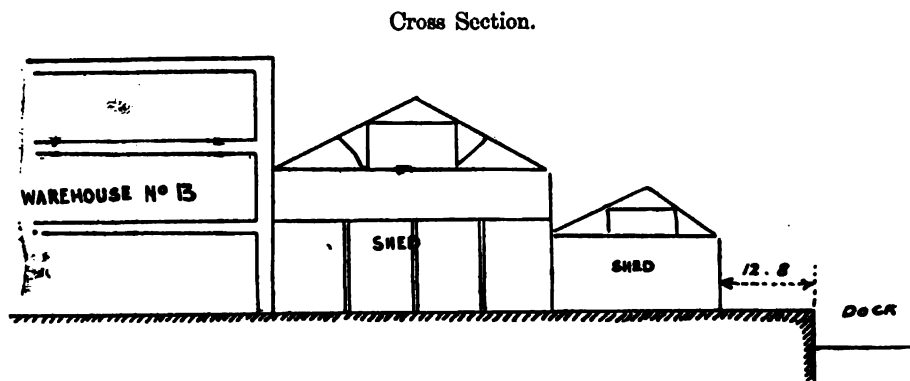

No. 9 Bonded Warehouse.—A three story brick building, occupied by the Dock Company as a furniture wood and wool store.

Shed at side of No. 9 warehouse. A one story wooden building, occupied by the Dock Company.

In front of the above warehouses and sheds runs a one story wooden shed next the quay, occupied by the Dock Company.

No. 12 Bonded Warehouse.—A three story brick building, occupied by the Dock Company as a furniture wood and wool store.

No. 13 Bonded Warehouse.—A three story brick building, occupied by the Dock Company as a furniture wood and wool store.

No. 14 Bonded Warehouse.—A two story brick building, occupied by the Dock Company as a furniture wood and wool store.

In front of the above warehouses next the quay, runs a one story wooden shed with brick ends, occupied by the Dock Company.

No. 1 Shed.—A one story wooden building, occupied by Messrs. Johnson and Jorgensen, glass bottle manufacturers.

No. 2 Shed.—A one story wooden building, occupied by the Dock Company for general export goods.

No. 3 Shed.—A one story wooden building, occupied by the Dock Company for general export goods.

No. 4 Shed.—A one story wooden building, occupied by the Dock Company for general export goods.

No. 5 Shed.—A one story wooden building, occupied by the Dock Company for general export goods.

No. 15 Warehouse.—A one story brick building, occupied partly by the Orion Chemical Company, and partly by Messrs. Johnson and Jorgensen.

## Cross Section.

At low water ordinary neap tides -	18	0
At low water ordinary spring tides -	14	8
Depth of Thames Conservancy proposed channel:—	Ft.	In.
At low water ordinary spring tides -	22	0
Depth of water less at toe of side walls by -	5	0

For the effective depth for modern ships the following reductions will have to be made from the depth of water at the centre of sills, owing to the curve of the invert:—

	Ft.	In.
For ships of 60 feet beam -	2	0
For ships of 70 feet beam -	3	0
Quay above Trinity high water -	7	0
Side walls plumb.		
Invert flat but ramped at toe of side walls.		

The depth of water at the centre of the river Thames opposite the Royal Albert Entrance Lock is:—

	Ft.	In.
At high water ordinary spring tides -	42	4
At Trinity high water -	41	4
At high water ordinary neap tides -	37	4
At low water ordinary neap tides -	23	4
At low water ordinary spring tides -	20	0

Depth of Thames Conservancy proposed channel:—  
At low water ordinary spring tides - 22 0

From the Lower Royal Albert Entrance Lock a wharf 1,000 feet long and 50 feet in breadth, stretches down the Thames on the North bank, having a depth of water alongside at low water ordinary spring tides of 27 feet, with a railway station abutting on it.

## PUMPING.

The water in the Royal Victoria Basin, the Royal Victoria Dock, the Royal Albert Dock, and the Royal Albert Basin is maintained at the level of Trinity high water by means of powerful pumps situated near the Upper Royal Albert Entrance Lock, and can be raised 9 inches higher when necessary.

## POWER.

Chiefly hydraulic.  
There are 190 hydraulic cranes.  
There are 4 steam cranes.  
There is 1 30-ton floating "Titan."  
There is 1 50-ton floating "Leviathan."  
There are 24 hand cranes.  
There are 13 hydraulic jiggers.  
There are 21 hydraulic lifts.  
All the gates are worked by chains by hydraulic power.  
The swing bridges are worked by hydraulic power.

Appendix.  
D.  
continued.

## RAILWAYS.

About 45 miles of single line, connected with the outside railway systems.

## ROADS.

About 12 miles.

## GENERAL.

The equipment of these docks is much more modern than those further up the river, as they seem to get the new plant, their old plant being moved on up to the older docks.

## B. THE ROYAL VICTORIA AND ALBERT DOCKS.

## WAREHOUSES AND TRANSIT SHEDS.

The storage capacity of the warehouses and sheds is estimated at 281,000 tons.

The floor area of the warehouses and sheds is estimated at 3,180,000 square feet.

## THE ROYAL VICTORIA BASIN.

On the North-West Quay are sheds, occupied by the Midland Railway Company.

At the back of the North Quay are sheds, occupied by the Great Northern Railway Company.

Shed No. 28, or N. Shed, a one-story wooden shed, occupied by the Dock Company for general cargo.

Cross Section.

Shed N. 38, or West Shed, a one-story wooden shed occupied by the Dock Company for general cargo: The South Quay is occupied by the Acme Wood Flooring Company, and Messrs. Cory and Sons.

## THE ROYAL VICTORIA DOCK.

## NORTH QUAY AND JETTIES.

E Warehouse, an iron one-story building, occupied by the Dock Company as an export shed.

G Shed, an iron two-story building, occupied by the Dock Company for imports.

G Warehouse, an iron one-story building, occupied by the Dock Company for exports.

X Warehouse, a brick four-story building, occupied by the Dock Company for tobacco.

Cross Section.

## Appendix.

D-  
continued.

D Warehouse, a brick two-story building with vaults, occupied on the ground floor by Messrs. Furness, Withy, and Co., Limited, and the first floor and vaults by the Dock Company for imports.

W Shed, a brick three-story building, occupied by the Dock Company for tobacco.

H Warehouse, an iron one-story building, occupied by Messageries Maritimes de France for imports.

H Warehouse, an iron one-story building, occupied by the Dock Company for exports.

C Warehouse, a brick, two-story building, with vaults, occupied on ground floor by Messrs. Furness, Withy and Co., Limited; on first floor by the Dock Company for imports, and the vaults for wine.

S Warehouse, a brick three-story building, occupied by the Dock Company for tobacco.

K Warehouse, a brick three-story building, occupied by the Dock Company for tobacco.

No. 33 Shed, a wooden one-story building, occupied by the Dock Company as a sack store.

No. 32 Shed, a wooden one-story building, occupied by the Dock Company for exports.

B Warehouse, a brick two-story building, with vaults, occupied on the ground floor by Messrs. Furness, Withy, and Co., Limited; and the first floor and vaults by the Dock Company for imports.

K Warehouse, an iron two-story building, occupied on the ground floor by Messrs. Tyser and Co., and on the first floor by the Dock Company for imports.

A Warehouse, a brick two-story building, with vaults, occupied on the ground floor by Messrs. Birt, Potter, and Hughes; the first floor and vaults by the Dock Company for imports.

Cross Section.

T Warehouse, a brick four-story building, occupied by the Dock Company for tobacco.

Cross Section.

V Warehouse, a brick four-story building, occupied by the Dock Company for tobacco.

L Warehouse, a brick three-story building, occupied by the Dock Company for tobacco.

I Warehouse, an iron two-story building, occupied by Thompson, of Aberdeen, for imports.

No. 1 Granary, a brick two-story building, occupied by the Dock Company for tobacco.

No. 2 Granary, a brick two-story building, occupied by the Dock Company for tobacco.

No. 3 Granary, a brick two-story building, occupied by the Dock Company for tobacco.

No. 4 Granary, a brick three-story building, occupied by the Dock Company for tobacco.

No. 5 Granary, a brick three-story building, occupied by the Dock Company for tobacco.

No. 6 Granary, a brick three-story building, occupied by the Dock Company for tobacco.

No. 7 Granary, a brick three-story building, occupied by the Dock Company for tobacco.

No. 8 Granary, a brick three-story building, occupied by the Dock Company for tobacco.

The Quay in front of Nos. 5, 6, 7, and 8 Granaries has been widened, and a two-story iron shed is being built on same.

At the present time the Thames Iron Works, Ship-Building and Engineering Co., Limited, use this corner of the dock for completing their war vessels after they have been launched at their yard, but this will have to be discontinued when the new shed comes into use.

## SOUTH QUAY.

No. 18 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 17 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 16 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 15 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 14 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 13 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 12 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 11 Shed, a brick one-story building, occupied by the Dock Company for general cargo.

No. 10 Shed, a brick one-story building, occupied by the Dock Company for general cargo.

No. 9 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 8 Shed, burnt down.

No. 7 Shed, a brick one-story building, occupied by the Dock Company for general cargo.

No. 5 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 4 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 3 Shed, a brick one-story building, occupied by the Dock Company for general cargo.

## Cross Section.

Appendix.  
D.  
continued.]

No. 2 Shed, a brick one-story building, occupied by the Dock Company for general cargo.

No. 1 Shed, a wooden one-story building, occupied by the Dock Company for general cargo.

No. 19 Shed, an iron one-story building, occupied by the Dock Company for a discharging berth.

## Cross Section.

No. 20 Shed, a wooden one-story building, occupied by the Dock Company for a discharging berth.

No. 21 Shed, an iron one-story building, occupied by the Dock Company for imports.

No. 23 Shed, an iron two-story building, reserved for the Allan Line for imports.

No. 22 Shed (in front of No. 14 and 15 Sheds), an iron two-story shed, occupied by the Royal Mail Steam Packet Company for imports.

Between the quay and the North Woolwich Road are situated four large corn elevators, belonging to the London Grain Elevator Company, and one is being

built by the Dock Company. They have water and railway access, the former through the pond at south-east corner of the dock, the latter from the west.

South-east corner is occupied by Messrs. Burt, Boulton and Haywood's railway sleeper works.

## CANAL.

At the north side of the canal, which joins the Royal Victoria Dock to the Royal Albert Dock, are situated large cold meat storages; these are being extended to the east side of the Connaught Road, the total capacity being 565,000 carcases.

## Cross Section.

The south side is occupied by the Old Mud Shoot, and the quay which has been taken over by the Great Western Railway Company.

## THE ROYAL ALBERT DOCK.

## NORTH QUAY.

The sheds are one-story iron buildings.

No. 35 Shed, occupied by the Dock Company, for exports for Messrs. Lamport and Holt.

No. 33 Shed, occupied by Messrs. John Swire and Sons (Ocean Steamship Company), for imports.

No. 31 Shed, occupied by Messrs. John Swire and Sons (Ocean Steamship Company), for imports.

No. 29 Shed, occupied by Messrs. John Swire and Sons (Ocean Steamship Company) for imports.

No. 27 Shed, occupied half by W. Lund for imports and half by the Dock Company for exports.

## Cross Section.

No. 25 Shed, occupied by the Dock Company for exports to New Zealand.

No. 23 Shed, occupied by the Dock Company for exports to New Zealand.

## Appendix.

D.  
continued.

No. 21 Shed, occupied by the Dock Company for exports to New Zealand.

No. 19 Shed, occupied by the Dock Company for the Peninsular and Oriental Steam Navigation Company's exports.

No. 17 Shed, occupied by the Dock Company for the Peninsular and Oriental Steam Navigation Company's exports.

No. 15 Shed, occupied by the Dock Company for the Peninsular and Oriental Steam Navigation Company's exports.

No. 13 Shed, occupied by the Dock Company for the Peninsular and Oriental Steam Navigation Company's imports.

No. 11 Shed, occupied by the Dock Company for the Peninsular and Oriental Steam Navigation Company's imports.

No. 9 Shed, occupied by the Dock Company for the Peninsular and Oriental Steam Navigation Company's imports.

No. 7 Shed, occupied by the Dock Company for the Peninsular and Oriental Steam Navigation Company's imports.

No. 5 Shed, occupied by the Dock Company for the Peninsular and Oriental Steam Navigation Company's imports.

No. 37 Shed, occupied by the Dock Company for carbon black.

The General Offices, Central Hotel, Ship Company's Offices, etc., are situated at the back of this quay.

## SOUTH QUAY.

At the west end are several private engineering firms, and two dry docks.

No. 28 Shed, occupied by Messrs. Gray, Dawes and Co. (British India Steam Navigation Company) for imports.

Cross Section.

No. 26 Shed, occupied by Messrs. Gray, Dawes and Co. (British India Steam Navigation Company) for imports.

No. 24 Shed, occupied by the New Zealand Shipping Company for imports.

No. 22 Shed, occupied by the Atlantic Transport Line (New York) for imports.

No. 20 Shed, occupied by the Atlantic Transport Line (New York) for imports.

No. 18 Shed, occupied by the Atlantic Transport Line (New York) for imports.

No. 16 Shed, occupied by the Wilson, Furness and Leyland Line (New York) for imports.

No. 14 Shed, occupied by the Wilson, Furness and Leyland Line (New York) for imports.

No. 12 Shed, occupied half by the Wilson, Furness and Leyland Line (New York), and half by the Dock Company for imports.

No. 10 Shed, occupied by the Wilson, Furness and Leyland Line (New York) for imports.

No. 8 Shed, occupied by the Shaw, Savill and Albion Company for imports.

No. 6 Shed, occupied by Thompson, of Aberdeen, half for exports and half for imports.

At the back of this quay is the site for the proposed new dock.

## A. 8.—THE TILBURY DOCKS.

The entrance to the Tilbury Docks is situated 25m. 7f. 4chs. below London Bridge on the north side of the River Thames.

The depth of water at the centre of the River Thames opposite this entrance is:—

	Ft.	In.
At high water ordinary spring tides	66	9
At Trinity high water	65	9
At high water ordinary neap tides	61	9
At low water ordinary neap tides	47	9
At low water ordinary spring tides	45	0

## Depth of Thames Conservancy proposed channel:—

	Ft.	In.
At low water ordinary spring tides	26	0
Area inside Dock Company's boundaries	279	0 0
Company's property not included in above	286	0 0
Water area	73	0 0

## TIDAL BASIN.

## Depth of water:—

	Ft.	In.
At high water ordinary spring tides	46	0
At Trinity high water	45	0
At high water ordinary neap tides	41	0
At low water ordinary neap tides	27	0
At low water ordinary spring tides	24	3

## Depth of Thames Conservancy proposed channel:—

	Ft.	In.
At low water ordinary spring tides	26	0

## ENTRANCE LOCK.—Cross Section.

Appendix.  
D.  
continued.

	Ft. In.
Length between outer and inner gates-	700 0
Divided by middle gates into 550 feet and	154 0
Deduct for swing of gates, etc., say-	20 0
Width at coping - - - - -	80 0
Width at invert - - - - -	80 0

	Outer Sill.	Inner Sill.
	Ft. In.	Ft. In.
Depth of water at centre of :		
At high water ordinary spring tides - - - - -	45 0	39 0
At Trinity high water - - - - -	44 0	38 0
At high water ordinary neap tides - - - - -	40 0	34 0
At low water ordinary neap tides - - - - -	26 0	20 0
At low water ordinary spring tides - - - - -	23 3	17 3
Depth of Thames Conservancy proposed channel :		
At low water ordinary spring tides (The middle sill is at the same level as the outer sill.)	26 0	26 0
Depth of water less at toe of side walls by - - - - -	5 0	5 0

For the effective depth for modern ships the following reductions will have to be made from the depth of water at the centre of the outer sill owing to the curve of the invert :—

	Ft. In.
For ships of 69 feet beam - - - - -	3 0
Quays above Trinity high water - - - - -	4 6
Side walls plumb.	
Invert curved.	

MAIN DOCK.

	A. R. P.
Area - - - - -	25 0 0
	Ft. In.
Width - - - - -	600 0
Depth of water :—	
At high water ordinary spring tides - - - - -	39 0
At Trinity high water - - - - -	38 0
At low water ordinary neap tides - - - - -	34 0
Water level is not raised by pumping.	
The west end of the docks is sloped, and is left without a quay in view of future extensions.	

EAST BRANCH DOCK.

	A. R. P.
Area - - - - -	9 0 29
	Ft. In.
Average width - - - - -	250 0
Depth of water :—	
At high water ordinary spring tides - - - - -	39 0
At Trinity high water - - - - -	38 0
At high water ordinary neap tides - - - - -	34 0
Water level is not raised by pumping.	

CENTRE BRANCH DOCK.

	A. R. P.
Area - - - - -	11 0 3
	Ft. In.
Width - - - - -	300 0
Depth of water :—	
At high water ordinary spring tides - - - - -	39 0
At Trinity high water - - - - -	38 0
At high water ordinary neap tides - - - - -	34 0
Water level is not raised by pumping.	

PUMPING.

There is no provision for raising the water level of the docks by pumping or otherwise, so the water level depends upon the amount of locking that takes place between the time of spring tides and neap tides.

POWER.

Chiefly hydraulic.  
There are 53 hydraulic cranes.  
There are 2 steam cranes.  
There is 1 hand crane.  
There is 1 floating "Mammoth."  
There is 1 floating 30-ton derrick.  
The gates are worked by chains by hydraulic power.  
The power house is situated at the north end of the docks

RAILWAYS.

About 26 miles of single line, connected with the London, Tilbury, and Southend Railway.

ROADS.

About 2½ miles.

GENERAL.

These docks may be called railway docks, as being situated so far from London there is but little carting of goods; in fact, they seem chiefly to be used by vessels of the largest modern type that would have difficulty in going up the river in its present condition, or are even too large for the entrances of the Royal Victoria and Albert Docks. These docks were built to compete with the Royal Victoria and Albert Docks, and as such were a complete failure, and, as far as London is concerned, are quite too far away ever to be used for choice. The railways run at front and back of all the transit sheds, and take all the land carriage.

B.—THE TILBURY DOCKS.

WAREHOUSES AND TRANSIT SHEDS.

There are no warehouses at these docks.  
The storage capacity of the sheds is estimated at 80,000 tons.  
The floor area of the sheds is estimated at 968,000 square feet.

TIDAL BASIN.

Shed on North Quay used by Ostend Line.

Shed on East and South Quays in Dock Company's hands, used by S.S. "La Marguerite," etc.

Cross Section.

Docks.

The sheds are of corrugated iron, wood frames, double spans of 60ft., and occupied by general goods.  
Shed A, used by Bibby Line.

Cross Section.

Shed B, half used by Bibby Line, and half in Dock Company's hands.

Shed C, half in Dock Company's hands, and half used by White Star Line.

Shed D, used by White Star Line.

Shed E, not built.

Shed H, half used by City Line and half by Clan Line.

Shed I, used by Clan Line.

Shed J, used by Clan Line.

Cross Section.

Shed K, in Dock Company's hands.  
Shed L, in Dock Company's hands.  
Shed M, in Dock Company's hands.

Shed N, half in Dock Company's hands, and half used by Clan Line.

Cross Section.

Shed O, in Dock Company's hands.  
Shed P, used by Nippon Yusen Kaisha Line.  
Shed Q, in Dock Company's hands.  
Shed R, used by Messrs. T. and J. Harrison.  
Shed S, in Dock Company's hands.  
Shed T, in Dock Company's hands.  
Shed U, used by Anchor Line.  
Shed V, half in Dock Company's hands, and half used by Messrs. T. and J. Harrison.  
Shed W, used by Atlantic Transport Line.

Shed X, used by Atlantic Transport Line.  
Shed Y, used by Atlantic Transport Line.  
Shed Z, used by Atlantic Transport Line.  
Quay No. 13, used for the railway sleeper works of Messrs. William Christie and Co.  
Quay No. 14, used by Messrs. William Cory and Sons, Limited, for the shipment of coal.

From the foregoing Cross Sections the position of the Sheds relatively to the Quays can be seen.

## A. 9.—THE SURREY COMMERCIAL DOCKS.

The Grand Surrey Entrance Lock is situated 1m. 6f. 7chs. below London Bridge, on the south side of the River Thames.

The depth of water at the centre of the River Thames opposite this entrance is:—

	Ft. In.
At high water ordinary spring tides	- 34 4
At Trinity high water	- 33 4
At high water ordinary neap tides	- 29 4
At low water ordinary neap tides	- 15 4
At low water ordinary spring tides	- 12 0

Depth of Thames Conservancy proposed channel:—

	Ft. In.
At low water ordinary spring tides	- 18 0

The depth of water over the Blackwall Tunnel, which passes under the bed of the river further down, is at low water ordinary spring tides 17ft., leaving a depth of material above the extrados of the arch of the tunnel of about 14ft. 8in. The Thames Conservancy proposed channel only lessens this by one foot.

	A.	R.	P.
Area inside Company's boundaries	370	0	8
Canal premises and other property	81	0	0
Water area - - - - deep	102	1	3
Water area - - - - shallow	63	2	14

## THE GRAND SURREY ENTRANCE LOCK.

## Cross Section.

	Ft. In.
Length between outer and inner gates	250 0
Deduct for swing of gate, etc. - say	20 0
Width at coping - - - -	50 0
Width at invert - - - -	50 0
Depth of water on centre of sills:—	
At high water ordinary spring tides	- 28 3
At Trinity high water	- 27 3
At high water ordinary neap tides	- 23 3
At low water ordinary neap tides	- 9 3
At low water ordinary spring tides	- 5 11

Depth of Thames Conservancy proposed channel:—

	Ft. In.
At low water ordinary spring tides	- 18 0
Depth of water less at toe of side walls by - - - -	8 3

For the effective depth for modern ships the following reductions will have to be made from the depth of water at centre of sills, owing to the curve of the invert:—

	Ft. In.
For ships of 35 feet beam - - - -	- 2 0
For ships of 40 feet beam - - - -	- 3 0
For ships of 45 feet beam - - - -	- 5 0
Quay above Trinity high water	- 4 0
Water level is not raised by pumping.	
Side walls plumb.	
Invert curved.	

## THE SURREY BASIN.

This basin, owing to the increase in the size of ships has now to be used as a lock.

	A.	R.	P.
Area - - - - -	2	3	3½
	Ft. In.		
Average length - - - - -	400	0	
Depth of water at Trinity high water	- 27	0	
Depth of water at high water ordinary neap tides - - - - -	- 23	0	
Quay above Trinity high water - - - -	- 4	0	
Water level is not raised by pumping.			

## PASSAGE FROM THE SURREY BASIN TO THE ALBION DOCK.

## Cross Section.

One pair of gates.	
	Ft. In.
Width at coping - - - - -	50 0
Width at invert - - - - -	50 0
Depth of water at centre at Trinity high water - - - - -	25 0
Depth of water at centre at high water ordinary neap tides - - - - -	21 0
Depth of water less at toe of side walls by - - - - -	8 0

For the effective depth of modern ships the following reductions will have to be made from the depth of water at centre of sill, owing to the curve of the invert :—

For ships of 35 feet beam - - -	Ft. In.
For ships of 40 feet beam - - -	1 6
For ships of 45 feet beam - - -	2 6
Quay above Trinity high water - - -	4 0
Water level is not raised by pumping.	
Side walls plumb.	
Invert curved.	

Appendix.  
D.

Note.—In the foregoing particulars the new works in course of construction have been dealt with as if they were completed.

## PUMPING.

The level of the water in these docks depends on the tide of the day, as a level has to be maintained throughout in order to deal with the traffic. There is no provision for raising the water level by pumping or otherwise.

## POWER.

Chiefly hydraulic.

There are 16 hydraulic cranes.

There are 2 steam cranes.

There are 19 hand cranes.

Some of the warehouses have band machinery for the distribution of grain.

The gates at the Surrey Lock South Lock are worked by chains by hydraulic power, those at the Lavender Lock by hand.

The gates at the New Greenland Lock will be worked by hydraulic rams.

The swing bridges have hydraulic power, with the

exception of that between Lady Dock and the Norway Dock, but all the lifting bridges are worked by hand.

Appendix.

D.

continued.

## RAILWAYS.

There is railway access only to the South Dock in connection with the London, Brighton and South Coast Railway (Deptford branch).

## ROADS.

About eight miles.

## GENERAL.

These docks are almost entirely given over to the grain and timber trade.

## B.—THE SURREY COMMERCIAL DOCKS.

## WAREHOUSES AND TRANSIT SHEDS.

There is a storage capacity in the grain warehouses estimated at 271,000 quarters.

There is a storage capacity in the timber sheds estimated at 61,501 Petersburg standards, or 5,647,665 cubic feet, besides a very large extent of open stacking ground.

The floor area of the warehouses and sheds is estimated at 3,000,000 square feet.

The sheds have mostly brick side walls, iron columns, from 20 to 25 feet in height, and wooden roofs.

The dock walls in the older portion consist of open timber wharfing, close timber wharfing, or concrete walls founded on close timber wharfing cut down to below water level.

The new dock walls are of concrete, the upper portion being faced with blue bricks.

The timber ponds have slopes, some of which are pitched with stone, but mostly unprotected.

## ACORN YARD.

Your obedient servant,

R. C. H. DAVISON.

## APPENDIX E.

(See paragraph 224 of the Report.)

## CORRESPONDENCE RELATIVE to the EXPENDITURE by the MERSEY DOCKS and HARBOUR BOARD upon NEW WORKS and IMPROVEMENTS.

ROYAL COMMISSION ON THE PORT OF LONDON,

19, Spring Gardens, S.W.

March 20th, 1902.

SIR,

With reference to the evidence given by you in March 1901 before this Commission, Lord Revelstoke desires me to request that you will be good enough, in order to supply the Commission with the latest figures, to state :—

1. The total capital expenditure by the Mersey Docks and Harbour Board for all purposes since its constitution in 1857 to the end of 1901.

2. The total capital expenditure to that date upon dredging or improving the harbour bar.

3. The average annual cost out of revenue of current dredging of the docks and river for the ten years ending 31st December, 1901.

I am, Sir,

Your obedient servant,

BERNARD HOLLAND.

Secretary.

The General Manager and Secretary,  
Mersey Docks and Harbour Board.

Appendix.

E.

Appendix.  
D.  
continued.

Appendix.  
E.  
continued.

MERSEY DOCKS AND HARBOUR BOARD,  
General Manager and Secretary's Office,  
Liverpool, *April 1st, 1902.*

SIR,  
Referring to your letter of the 20th ultimo, requesting to be furnished with certain information as to the capital expenditure of this Board, etc, I beg to reply thereto as follows:—

1. The total capital expenditure by this Board, for all purposes, under their borrowing powers, for the 44 years commencing the 25th of June, 1857, and ending the 1st of July, 1901, amounts to £19,371,598, exclusive of expenditure for new works and improvements, out of revenue.

2. The total capital expenditure to the 1st of July, 1901, upon dredging or improving the harbour bar, amounts to £438,950.

This expenditure is in respect of the operations which are being carried out to obtain an increased depth of water at the Mersey Bar, and includes the cost of the vessels, and insurance and depreciation.

3. The average annual cost out of revenue of current dredging of the docks and river for the ten years ending the 1st of July, 1901, amounts to £27,692.

This expenditure is on account of dredging, scuttling, sluicing, etc.

You will observe that the information is given up to the 1st of July last, and not the 31st of December last as requested in your letter, the former being the date on which the Board's last financial year expired.

I am, Sir,

Your obedient servant,

MILES KIRK BURTON.

*General Manager and Secretary.*

Bernard Holland, Esq.,  
Secretary,  
Royal Commission on the Port of London,  
19, Spring Gardens, London, S.W.

ROYAL COMMISSION ON THE PORT OF LONDON.

19, Spring Gardens, S.W.

*April 4th, 1902.*

SIR,

I am obliged for the information given in your letter of the 1st instant.

I shall be glad if you will also state the amount of the total expenditure of your Board out of revenue on new works and improvements up to the 1st July, 1901.

It would be useful to the Commission if you were able to inform them how much of the total sum spent by your Board upon new works and improvements, whether out of revenue or out of borrowed capital, was expended upon the docks, and how much upon river works.

I am, Sir,

Your obedient servant,

BERNARD HOLLAND.

*Secretary.*

The General Manager and Secretary,  
Mersey Docks and Harbour Board, Liverpool.

MERSEY DOCKS AND HARBOUR BOARD.

General Manager and Secretary's Office,  
Liverpool, *April 15th, 1902.*

*Capital Expenditure, etc.*

SIR,  
Referring to your letter of the 4th instant, requesting to be furnished with certain further information hereon, I beg to reply thereto as follows:—

1. The amount of the total expenditure out of revenue on new works and improvements, for the 44 years commencing 25th June, 1857, to the year ending 1st July, 1901, may approximately be taken at £2,200,000.

2. The total sum spent by the Board upon new works and improvements may be set down as follows:—

(a) Capital Expenditure under Borrowing Powers, as given in paragraph No. 1 of my letter of the 1st instant	...	...	£19,371,598
(b) Expenditure out of Revenue as above mentioned	...	...	2,200,000
Total	...	...	<u>£21,571,598</u>

The whole of this amount may be taken as expenditure upon docks, and the sum of £438,950, mentioned in paragraph No. 2 of my letter of the 1st instant, as being the total capital expenditure to the 1st of July, 1901, upon the dredging or improving of the harbour bar as the only amount applicable to "river works," if by that term is meant works carried out to improve the navigable channels of the estuary and river.

I am, Sir,

Your obedient servant,

MILES KIRK BURTON.

*General Manager and Secretary.*

Bernard Holland, Esq.,  
Secretary,  
Royal Commission on the Port of London,  
19, Spring Gardens, London, S.W.

ROYAL COMMISSION ON THE PORT OF LONDON,

19, Spring Gardens, S.W.,

*April 25th, 1902.*

SIR,

It appears from your answers given in evidence to the Commission (4623-30) that the total amount expended upon their works by the Mersey Docks and Harbour Board to the 1st July, 1900, was £23,947,842 of which £19,930,989 was raised under borrowing powers and the remaining £4,016,853 was derived from sinking fund and unappropriated revenue.

In your letter of the 1st instant you state that the total capital expenditure of the Board for all purposes under the borrowing powers for the 44 years commencing 25th June, 1857, and ending 1st July, 1901, amounts to £19,371,598, a sum slightly less than that mentioned by you in evidence. In your letter of the 15th instant you give the total expenditure upon new works and improvements as

(a) Capital expenditure and Borrowing Powers, as given in paragraph 1 of my letter of the 1st instant	...	...	£19,371,598
(b) Expenditure out of Revenue as above mentioned	...	...	2,200,000
Total	...	...	<u>£21,571,598</u>

I am directed to inquire whether the difference between the £23,947,842 mentioned by you in answer 4628 and the £21,571,598 mentioned in your letter is due to the fact that monies derived from sinking fund have been invested in the works to the extent of this difference. The Commissioners wish to ascertain the total expenditure of the Board to the 1st July, 1901 upon new works and improvements from whatever source the funds are derived.

The Commission would also be much obliged if you would furnish them with the total average annual cost upon dredging of all kinds out of both capital and revenue for the ten years ending 1st July, 1901.

I am, Sir,

Your obedient servant,

BERNARD HOLLAND,

*Secretary.*

The General Manager and Secretary,  
Mersey Docks and Harbour Board, Liverpool.

Mersey Docks and Harbour Board,  
General Manager and Secretary's Office,  
Liverpool, May 6th, 1902.  
*Capital Expenditure, &c.*

SIR,

Referring to your letter of the 25th ultimo, with regard to the amounts of capital expenditure, etc., furnished to you in my letters of the 1st and 15th ultimo, and to my answers on the same subject given in evidence before the Royal Commission on the Port of London on the 25th of March, 1901, I beg to reply as follows, viz:—

1. The amount of £23,947,842, mentioned in the first paragraph of your letter of the 25th ultimo, represents the total Capital Expenditure on the Liverpool and Birkenhead Dock Estate by the Mersey Docks and Harbour Board and their predecessors under Borrowing Powers, exclusive of works paid out of revenue, since the first Liverpool Dock Act was passed in 1709, to the 1st July, 1900, a period of 191 years, and this expenditure was provided as under—

Loans on Bond, consideration for Mersey Dock An- nuities and Pro- missory Notes -	£19,930,989
Sinking Fund -	£3,165,280
Unappropriated Revenue, etc. -	851,573
	<u>4,016,853</u>
	<u>£23,947,842</u>

as stated in the Board's printed accounts for the year ending the 1st of July, 1900, page 3.

The amount referred to in the second part of your letter, viz:—£19,371,598, represents the total capital expenditure by the Mersey Docks and Harbour Board *only*, under Borrowing Powers, exclusive of Works paid out of Revenue, from 25th June, 1857, to the 1st of July, 1901, a period of 44 years.

It will be seen therefore, that (beyond the fact that the second paragraph deals with a year later than the first paragraph), the difference between the last mentioned amount of £19,371,598, and the figures given in evidence, is the amount expended on Dock Works from 1709 to 1857, that is, for the period prior to the formation of the Mersey Docks and Harbour Board.

If the Commissioners wish to ascertain the total expenditure on the Liverpool and Birkenhead Dock Estate since the constitution of the Mersey Docks and Harbour Board, i.e. from 25th June, 1857 to the 1st of

July, 1901, upon New Works and Improvements from whatever source the Funds are derived, the approximate amount will be

Capital Expenditure under Borrow- ing Powers - - - - -	£19,371,598
Expenditure out of Revenue - - -	2,200,000
	<u>£21,571,598</u>

as stated in paragraph No. 2 of my letter of the 15th ultimo.

If, however, the Commissioners wish to ascertain the total expenditure on the Liverpool and Birkenhead Dock Estate of the Mersey Docks and Harbour Board and their predecessors, from 1709 to 1st July, 1901, the approximate amount will be

Capital Expenditure under Borrowing Powers (as per Board's Printed Accounts for 1901, page 2) - - -	£25,219,703*
Expenditure out of Revenue, viz:—	
1709–1857, Predecessors of the Mersey Docks and Harbour Board -	£1,500,000
1857–1901, Mersey Docks and Harbour Board - - - - -	2,200,000
	<u>3,700,000</u>
	<u>£28,919,703</u>

2. The total average annual cost upon Dredging of all kinds, out of both Capital and Revenue, (including the cost of vessels, insurance and depreciation) for the ten years ending 1st July, 1901, may be taken approximately at £125,000.

Copies of the Board's Printed Accounts for the years ending the 1st of July, 1900 and 1901, are enclosed.

I am, Sir,

Your obedient servant,  
MILES KIRK BURTON,  
General Manager and Secretary

2 enclosures.

Bernard Holland, Esq.,  
Secretary,  
Royal Commission on the Port of London,  
19, Spring Gardens, London, S.W.

\* The corresponding figure for the 1st of July, 1900, was £23,947,842, stated in reply to question No. 4628 of the Royal Commission Evidence.

## APPENDIX F.

(See paragraph 304 of the Report.)

### CORRESPONDENCE RELATIVE to the COLLECTION of DUES upon GOODS in CERTAIN PARTS of the UNITED KINGDOM.

ROYAL COMMISSION ON THE PORT OF LONDON.  
19, Spring Gardens, S.W.,  
3rd January, 1902.

SIR,

I am directed by Lord Revelstoke, the Chairman of the Commission, to request that you will be so good as to furnish me with information on the following points:—

- (1) The exact process by which dues upon goods entering the Port of Glasgow are collected and paid.
- (2) Whether there has been found to be much difficulty or expense about the process.
- (3) Whether dues are levied upon all goods, or whether any classes of goods are exempted.

I am, Sir,

Your obedient Servant,  
BERNARD HOLLAND, Secretary.

Above letter sent to—

Clyde Navigation,  
Mersey Docks and Harbour Board,  
Bristol Docks,  
Tyne Improvement Commission.

5823.

TYNE IMPROVEMENT COMMISSION.

Newcastle-upon-Tyne,  
7th January, 1902.

DEAR SIR,

I duly received your letter of the 3rd instant, and in reply to your questions Nos. 1, 2 and 3 have to state as follows, viz:—

1. River dues on goods entering the Port of Tyne are collected under the powers of the Harbours, Docks and Piers Clauses Act, 1847, the Tyne Improvement Act 1861, and the Tyne Improvement Act, 1865, and the Tyne Improvement Act, 1890.

Under the first-named Act returns of the goods unshipped in the Port are obtained from the masters of vessels or their agents, and under the other Acts named returns are obtained from the consignees or owners of the goods unshipped.

The former returns are known as "Reports" and the latter as "Entries."

These two separate and independent sets of particulars

Appendix.  
F.

Appendix. act as a check upon each other, and all errors or omissions ascertained through such checking are adjusted.

F. The dues chargeable in respect of the goods specified in the foregoing returns are collected as follows:—

- continued.
- (a) A fair proportion of the due is paid by the consignees at the time they hand in the entries of their consignments, and in these cases no accounts are rendered.
  - (b) In certain other cases accounts are rendered to the consignees for the dues on the goods specified in the returns furnished by them, and the amounts are either remitted direct by the consignee to the commissioners' collector, or paid on personal application.
  - (c) In the case of certain lines of regular steam traders, the commissioners have arranged with their agents, for a consideration, to hold themselves responsible for the dues on the whole of the cargoes of their vessels, and these are paid over monthly to the commissioners' collector.
  - (d) And, finally, in the case of consignees who only receive small and infrequent consignments during the year, accounts for the dues chargeable thereon are rendered to such consignees made up from the particulars given in the "Report" furnished by the master of the vessel or his agent, and the usual entries are in such cases dispensed with.

2. There is a considerable amount of work entailed in the gathering in of the aforesaid "Reports" and "Entries," and especially in the labour of checking off the many thousands of items specified on the Returns, but beyond this it cannot be really said that many difficulties are met with in the work.

The expense of collecting the River Dues on goods entering the Port in 1900 was rather over £1 per cent.

3. Dues are levied upon all goods discharged within the limits of the Port of Tyne, with the exception of fish caught in the open sea.

For your information I enclose you a print of the Commissioners' Rates, Tolls, Dues, and Charges, which contains extracts from the Acts of Parliament above referred to.

I am, Sir,  
Yours faithfully,  
R. URWIN,  
Secretary.

1 Enclosure.

Bernard Holland, Esq., Secretary,  
Royal Commission on the Port of London,  
19, Spring Gardens, London, S.W

7/2125. 2 Enclosures.

Bristol Docks Office,  
Queen Square, Bristol,  
8th January, 1902

Sir,

In reply to your letter of the 3rd instant I have the honour to give you the following information with respect to the collection of dues at this port:—

1. (a) *Foreign Goods*.—On the arrival of a vessel it is under the Wharfrage Act of 1807, the duty of the consignee or consignees of the cargo to produce to the collector of dues the usual customs' "entry," and to pay the dock dues on the quantities or weight specified thereon. The Collector of Dues then certifies by india-rubber stamp on the face of the entry that such dues have been paid, without which the Collector of Customs is prevented by the Act referred to from accepting entry at the Custom House and the cargo from being landed. When the delivery of the Cargo has been completed the particulars of quantities and weights appearing on the entries are compared with the ship's out-turn, and post entries if necessary are passed.
- (b) With respect to goods arriving *coastwise* the bulk thereof at this port is carried in regular Liners from the principal ports of the United Kingdom. In these cases the owners or agents of the ship take the whole responsibility of the collection of the dues from the consignees in consideration of the payment by the Docks Committee of a small commission. On all other goods the Docks Committee require the payment of the dues by the consignees or their

agents immediately on the arrival of the importing vessel, and for this purpose, as no customs entry is required, a special form is provided, copy of which is appended hereto.

2. No difficulty is ever experienced in the process of collecting these dues. In the case of dues on goods from foreign parts the provisions of the special Act mentioned above practically insure the prompt payment thereof, and as regards coastwise goods the owners are aware of the powers which the Collector of Dues has under 10 Vic. cap. 27 to arrest any goods on which the dues have not been paid, and he therefore takes care to make the necessary payment before they are removed from the Dock premises. No exceptional expenditure is incurred in the collection of these dues, the only cost being that of the clerical staff engaged in receiving and checking the various entries and comparing them with the ship's manifest.
3. Dues are levied upon all goods imported in respect of "entry to port" whether landed on the quay or not, with the exception of those which arrive coastwise for direct transhipment to foreign-going vessels.

I notice that your inquiry refers only to goods *entering* the port, and it is to such goods that my remarks apply, there being no export dues at the Port of Bristol.

I enclose a copy of the schedule of dues on shipping and rates on goods, and shall be happy to furnish any further information which may be required by your Commission.

I am, Sir,  
Your obedient Servant,  
F. B. GIRDLESTONE,  
Secretary and General Manager.

Bernard Holland Esq., Secretary,  
Royal Commission on the Port of London,  
19, Spring Gardens, London, S.W.

General Manager and Secretary's Office,  
Glasgow, 8th January, 1902.  
Dues on Goods.

4892.

SIR,

I duly received your letter of 3rd inst., and, as requested, have the pleasure in answer to your three queries, to give you the following information:—

1. The process by which dues and goods entering the Port of Glasgow are recovered is so intimately related to the system by which dues on goods outwards and on vessels inwards and outwards are collected and paid, that it appears to me the only satisfactory way of dealing with the question is to describe the methods applicable to all these operations.

The statutory rules under section 8 of our Act of 1887 with respect to payment of rates, as you will see on page 30 of the enclosed rates book, are that the rates on vessels inwards must be paid before any of the cargo is unshipped, and on outward vessels before any cargo is shipped, and on all other vessels before they leave the Harbour, on inward cargo before it shall be removed from the Trustees' premises, and on cargo outward before it is shipped.

In carrying out these rules, three separate methods of recovering the dues are adopted. The first method is, monthly credits or accounts are allowed to a limited number of shipowners having regular lines. No monetary or other security is lodged by these firms with my Trustees, who have statutory authority to allow those who, at the passing of the 1887 Act, had monthly credits, to continue paying in that manner. The system is very old, and it is not known how or when it originated. Where monthly credit is in operation, a vessel on arrival is allowed to discharge and give delivery of her cargo without hindrance, and the outward cargo is shipped under the same conditions, the vessel being permitted to sail without any interference on the part of my Trustees. In this class of transaction the shipowner take responsibility for collection and payment to us of dues on the cargo; this, however, does not deprive any consignee or shipper of the right to settle direct, which is largely done, but principally on foreign goods, inwards and outwards. In such cases the amount of the shipper's

consignee's payment is deducted from the sum payable by the shipowner at his monthly settlement.

There is one firm of shipowners who do not accept responsibilities for dues on cargoes; but facilities are afforded for stopping the goods if we desire it; and no loss has for a considerable time been made by the Trust.

The second method is, security is taken from the shipowner in the form either of a cash deposit or of a banker's guarantee, the terms of which you will find enclosed. This is called the "Periodic Deposit system."

The deposits are calculated on an average of several months to cover the dues on ship and cargoes for a period of a week, a fortnight, or a month, as the case may be; and at the end of such period the returns for ship and cargoes are sent in to our collector, who checks them and receives payment as soon thereafter as possible, the original deposit being allowed to remain in the trustee's hands, but not for longer than one year without renewal.

Where security is given by banker's guarantee vessels and cargoes are treated exactly in the same way as with monthly credits.

The third method is that relative to individual vessels and their cargoes not coming under either of the above categories, and is known as the "ordinary deposit system."

The agent or owner of the vessel leaves a deposit with our collector for both ship and cargo inwards; and if the same agent or owner has the working of the vessel outward, he leaves a sum to cover ship and cargo out as well, rather than come back a second time in clearing the vessel. After the vessel has (perhaps a day or so) left the port, the agent or owner of the vessel sends in a complete statement of the weights and quantities of the cargoes, with the ports from and to which the vessel was bound; and this statement is checked with the measurers', weighters', and harbour master's returns, and, if correct, passed to our cashier, who thereupon places the amount of the deposit to credit of the account in settlement, along with any sum which may have been paid by a consignee or shipper on the part of the cargo originally covered by the ship's deposit. If the ship's agent does not wish to take the responsibility for the payment of dues on cargo, then he must make a complete return to the trustee's collector of vessel's cargo, along with the name of the consignee or shipper of same, who must pay the dues before the goods can be removed from the trustees' premises.

Where the vessels and goods inwards and outwards are separately paid for, the practice is that payment of the dues on ships is not asked for until the vessel is about to sail, but must in all cases be paid before it leaves the harbour. In the case of inward cargo, the goods are allowed to be placed on the quay or in shed; but the dues must be paid before removal from the Trustee's premises. In the case of outward cargoes they are allowed to be laid down in the vessel's berth but not shipped until the dues are paid.

I may state, as showing the extent to which deposits cover accounts for dues, that at our annual balance on 30th June last the deposits in hand were 25,600*l.* and bankers' guarantees 2,100*l.*, while the dues outstanding amounted to 28,216*l.* 13*s.*, leaving a sum of only 516*l.* uncovered.

I enclose a complete set of the forms used by our collector in carrying out the work.

2. In reply to your second query, whether there is not much difficulty or expense about the collection of dues, there is not. Our collector's department is wrought on a well-organised system, which is both economical and efficient. Last year's dues of all classes amounted to over 430,000*l.*, and the cost of collection may be taken at, say, 6,000*l.*

3. As regards your third query, as to whether dues are levied upon all goods, or whether any classes of goods are exempted, I would refer you to the evidence I gave before the Commission, where from about the middle of page 252, commencing "then as to goods," to the end of paragraph 5025, you will find a concise and complete answer.

If I can be of any further service in any way I shall be very glad.

I am, Sir,

Your obedient Servant,

T. R. MACKENZIE.

Bernard Holland, Esq., Secretary,  
Royal Commission on the Port of London,

# MERSEY DOCKS AND HARBOUR BOARD.

General Manager and Secretary's Office,

Sir, Liverpool, 18th January, 1902.

In answer to your letter of the 3rd instant, requesting to be furnished with information on the following point, viz.:-

1. The exact process by which dues upon goods entering the Port of Liverpool are collected and paid.
2. Whether there has been found to be much difficulty or expense about the process.
3. Whether dues are levied upon all goods, or whether any classes of goods are exempted.

I beg to reply as follows:-

1. *The exact process by which dues upon goods entering the Port of Liverpool are collected and paid:-*

All goods imported into the Port of Liverpool from foreign ports are liable to the payment of inward foreign dock rates and town dues, according to the description of goods as specified in the enclosed copy of the Board's Tables of Rates and Dues payable in respect of ships and goods.

Before delivery of the goods is allowed to be taken from the Dock Quays, importers are required to present to the Board's Receiver of Rates and Dues, a Dock and Town Dues Bill, and at the time of paying these dues a Customs Warrant is presented on one of the Customs forms, specimens of which are enclosed herewith. This latter document after being impressed with a stamp by the Board's Receiver, indicating that the rates due to the Board have been paid, is presented at the Custom House by the importer, and is then passed by the Customs for the delivery of the goods.

When the dock rates and town dues are payable by weight, the importer passes a prime entry in the first instance, and after the goods have been weighed a Post Entry is passed for the balance.

Goods imported from coastwise ports are liable to both dock rates and town dues, but at present only town dues are being collected (*see note 2 page 27 of the enclosed Rate Book*). The importer, as regards coastwise goods, presents to the Board's Receiver a Town Dues Bill, and pays the town dues due to the Board, but the Customs do not require any warrant for coastwise goods.

In a large number of cases, agents of vessels which trade regularly between this port and other coastwise ports compound with the Board for the payment of the dues on the cargo carried by their vessels. *See Section 12 of the "Mersey Docks Act, 1874."*

2. *Whether there has been found to be much difficulty or expense about the process:-*

Beyond a very large correspondence, dealing chiefly with disputed questions as to weights and the number of packages imported, no difficulty is experienced in collecting the revenue, except in some cases where attempts are made by importers to describe goods incorrectly with a view of evading a higher rate. These cases as compared with the whole are comparatively few in number.

No attempt to set down the expense of collecting the revenue of the Board can be of much value, as the work of the departments is so interlocked that there is practically no department which, in some sense or another, does not assist in securing the payment to the Board of the dues to which they are properly entitled.

The following are the offices principally concerned with the collection of the Board's revenue from rates and dues on ships and goods, viz.:-

Rates and Dues Department. Estimated cost £8,900 per annum.

This Department is established for the collection of dock rates and town dues on goods (outwards as well as inwards). It may be stated, however, that in this Department the tonnage rates on vessels are also collected together with certain of the revenue from other sources on the dock estate.

One branch of this department is the Post Entry Office. In this office the entries which have been passed in respect of the cargoes imported or exported by vessels in the Board's docks are compared with the Master Porter's abstract of the cargo in connection with inward goods and the ship's manifest as regards outward goods, and any difference between the two the parties are called upon to pay.

Check Office. Estimated cost £4,500 per annum.

Appendix.

F.  
continued

Appendix.  
F.  
continued.

This Department is established for the purpose of examining the whole of the documents in connection with the collection of dues, &c., to see that the Revenue as regards ships and goods is properly collected and accounted for.

It may be mentioned here, although perhaps it may not be considered within the scope of your inquiry, that Section 314 of "The Mersey Dock Acts Consolidation Act, 1858," provides for the election of a body of Commissioners, who are entitled Audit Commissioners, and are elected for the purpose of securing the proper audit of the accounts of the Board. In this connection may

also be mentioned the power given to the Board of Trade under Section 8 of "The Mersey Docks (Various Powers) Act, 1887," to appoint a special auditor who may either act alone or with the elected auditors in the auditing of the accounts of the board."

3. *Whether Dues are levied upon all Goods or whether any Classes of Goods are Exempted :*

Exemption from the payment of certain dues is allowed under the conditions mentioned in Clauses 30, 31, 32, 33, 34, and 36 of the enclosed Rate Book, viz. :—

Rate Book, page	Clause	GOODS.
		GOODS IN TRANSIT.
15	30	Foreign goods imported from foreign ports in transit to foreign ports and intended for immediate transshipment, are free of dock rates and town dues inwards, but are charged dock rates and town dues outwards on exportation. The forms used in these cases are as specified, viz :—  Dutiable or free goods in transit under Customs Transit Regulations.  Free goods in transit under the Boards Regulations.  Free goods in transit under the Board's Regulations and re-packed after importation. (Exempt inwards but charged outward dues, according to the form of package in which the goods are imported.)
17	31	Goods imported coastwise, and afterwards exported foreign or coastwise. (Exempt from town dues inwards.)  Goods imported coastwise, and afterwards exported foreign or coastwise ; re-packed after importation ; exempt from town dues inwards, but charged outward dues, according to the form of package in which the goods are imported.
17	32	Goods imported foreign and exported coastwise direct from the quay ; charged inward foreign dues, and exempted from outward coastwise town dues.
17	33	Goods imported foreign, and afterwards exported foreign or coastwise the <i>bona fide</i> sole property of the same person throughout. (Exempt from outward town dues, foreign or coastwise.)
17	34	Goods imported foreign or coastwise previously exported by the same owners. (Exempt from inward town dues.)
18	36	Imports or Exports brought into the Board's Docks under the conditions mentioned in this clause are exempt from dock rates and town dues.
18	37	NOTE.—Claims for exemption from dock rates and town dues . . . will be allowed only when the same are made and substantiated within a period of 12 months.  All articles for consumption on board vessels are exempt from dues.

Exemption is also allowed in the cases of the following articles, viz. :—

Rate Book, page	
31	Ballast.—Stone, gravel, or clay brought <i>bona fide</i> as ballast, and on which no freight is paid. Coal Bunker, imported coastwise and shipped into steamers for their own consumption on the immediate voyage on which they leave the port. Also coal brought to Liverpool or Birkenhead by rail and shipped <i>bona fide</i> for the steamer's own use.
35	Returned empty packages coastwise.
35	Returned empty beer packages.
36	Fish, fresh, and herrings kippered.
38	Furniture used and not for sale.
47	Passengers' luggage (private effects for personal use and not intended for merchandise), when accompanied by the passenger for the whole or part of the voyage.

In addition to the foregoing, the Board during their pleasure, charge certain goods, in particular circumstances, with what are called Differential Rates, and these are, in effect, only one-half of the dock rates and town dues on the goods which would be chargeable in the ordinary way.

Full particulars of these Differential Rates will be found on pages 15 and 16 of the enclosed Rate Book.

I am, Sir,  
Your obedient Servant,  
MILES KIRK BURTON.  
*General Manager and Secretary.*

ROYAL WARRANT DATED THE 21<sup>ST</sup> DAY OF JUNE, 1900.

*VICTORIA R.,*

**Victoria**, by the Grace of God, of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

**To** Our right trusty and right well-beloved cousin, Wilbraham, Earl Egerton ; Our right trusty and well-beloved John, Baron Revelstoke ; Our trusty and well-beloved Alfred Lyttelton, Esquire (commonly called the Honourable Alfred Lyttelton), one of Our Counsel learned in the Law ; Our trusty and well-beloved Sir Robert Giffen, Knight Commander of our Most Honourable Order of the Bath, Doctor of Laws ; Our trusty and well-beloved Sir John Wolfe Wolfe-Barry, Knight Commander of Our Most Honourable Order of the Bath, Doctor of Laws, Fellow of the Royal Society ; Our trusty and well-beloved Sir John Hext, Knight Commander of Our Most Eminent Order of the Indian Empire, Rear-Admiral on the Retired List of Our Navy ; and Our trusty and well-beloved John Edward Ellis, Esquire ; Greeting !

**Whereas** We have deemed it expedient that a Commission should forthwith issue to inquire into the present administration of the Port of London and the water approaches thereto ; the adequacy of the accommodation provided for vessels, and the loading and unloading thereof ; the system of charge for such accommodation and the arrangements for warehousing dutiable goods ; and to report whether any change or improvement in regard to any of the above matters is necessary for the promotion of the trade of the port and the public interest :

**Now know ye**, that We, reposing great trust and confidence in your knowledge and ability, have nominated, constituted, and appointed, and do by these Presents nominate, constitute, and appoint, you, the said Wilbraham, Earl Egerton ; John, Baron Revelstoke ; Alfred Lyttelton ; Sir Robert Giffen ; Sir John Wolfe Wolfe-Barry ; Sir John Hext ; and John Edward Ellis, to be Our Commissioners for the purposes of the said inquiry.

**And** for the better effecting the purposes of this Our Commission, We do by these Presents give and grant unto you, or any three or more of you, full power to call before you such persons as you shall judge likely to afford you any information upon the subject of this Our Commission ; and also to call for, have access to, and examine all such books, documents, registers, and records as may afford you the fullest information on the subject ; and to inquire of and concerning the premises by all other lawful ways and means whatsoever.

**And** We do by these Presents authorise and empower you, or any three or more of you, to visit and personally inspect such places as you may deem it expedient so to inspect for the more effectual carrying out of the purposes aforesaid, and to employ such persons as you may think fit to assist you in conducting any inquiry which you may hold.

**And** We do by these Presents will and ordain that this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any three or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

**And** we do further ordain that you or any three or more of you, have liberty to report your proceedings under this Our Commission from time to time if you shall judge it expedient so to do.

**And** Our further will and pleasure is that you do, with as little delay as possible, report to Us under your hands and seals, or under the hands and seals of any three or more of you, your opinion upon the matters herein submitted for your consideration.

Given at Our Court at Windsor, the twenty-first day of June, One thousand nine hundred, in the sixty-fourth year of Our Reign.

By Her Majesty's Command,

M. W. RIDLEY.

ROYAL WARRANT DATED THE 4TH DAY OF MARCH, 1901.

---

*EDWARD R.*

**Edward the Seventh**, by the Grace of God, of the United Kingdom of Great Britain and Ireland King, Defender of the Faith, to all to whom these presents shall come, Greeting !

**Whereas** it pleased Her late Majesty from time to time to issue Royal Commissions of Inquiry for various purposes therein specified :

**And** whereas in the case of certain of these Commissions, namely, those known as—

The Historical Manuscripts Commission ;  
The Horse Breeding Commission ;  
The Local Taxation Commission ;  
The Port of London Commission ;  
The Salmon Fisheries Commission ; and  
The Sewage Disposal Commission ;

the Commissioners appointed by Her late Majesty, or such of them as were then acting as Commissioners, were, at the late demise of the Crown, still engaged upon the business entrusted to them :

**And** whereas We deem it expedient that the said Commissioners should continue their labours in connection with the said inquiries notwithstanding the late demise of the Crown :

**Now** know ye that We, reposing great trust and confidence in the zeal, discretion, and ability of the present members of each of the said Commissions, do by these Presents authorize them to continue their labours, and do hereby in every essential particular ratify and confirm the terms of the said several Commissions.

**And** We do further ordain that the said Commissioners do report to Us under their hands and seals, or under the hands and seals of such of their number as may be specified in the said Commissions respectively, their opinion upon the matters presented for their consideration ; and that any proceedings which they or any of them may have taken under and in pursuance of the said Commissions since the late demise of the Crown, and before the issue of these Presents shall be deemed and adjudged to have been taken under and in virtue of this Our Commission.

Given at Our Court at Saint James's, the fourth day of March, one thousand nine hundred and one, in the first year of Our Reign.

By His Majesty's Command,  
CHAS. T. RITCHIE.

---

ROYAL WARRANT DATED THE 6TH DAY OF MARCH, 1901.

*EDWARD R.,*

**Edward the Seventh**, by the Grace of God, of the United Kingdom of Great Britain and Ireland, King, Defender of the Faith.

**To** Our right trusty and well-beloved John, Baron Revelstoke ; Our trusty and well-beloved William Robert Wellesley Peel, Esquire (commonly called the Honourable William Robert Wellesley Peel) ; Our trusty and well-beloved Alfred Lyttelton, Esquire (commonly called the Honourable Alfred Lyttelton), one of Our Counsel learned in the Law ; Our trusty and well-beloved Sir Robert Giffen, Knight Commander of our Most Honourable Order of the Bath, Doctor of Laws ; Our trusty and well-beloved Sir John Wolfe Wolfe-Barry, Knight Commander of Our Most Honourable Order of the Bath, Doctor of Laws, Fellow of the Royal Society ; Our trusty and well-beloved Sir John Hext, Knight Commander of Our Most Eminent Order of the Indian Empire, Rear-Admiral on the Retired List of Our Navy ; and Our trusty and well-beloved John Edward Ellis, Esquire ; Greeting !

**Whereas** it pleased Her late Majesty by Warrant bearing date the twenty-first day of June One thousand nine hundred to authorise and appoint certain noblemen and gentlemen therein named, or any three or more of them, to be Commissioners to inquire into the present administration of the Port of London and the water approaches thereto ; the adequacy of the accommodation provided for vessels, and the loading and unloading thereof, the system of charge for such accommodation and the arrangements for warehousing dutiable goods ; and to report whether any change or improvement in regard to any of the above matters is necessary for the promotion of the trade of the port and the public interest :

**Now know ye**, that We have revoked and determined, and do by these Presents revoke and determine, the said Warrant and every matter and thing therein contained.

**And** whereas We have deemed it expedient that a new Commission should issue for the purposes specified in the said Warrant, dated the twenty-first day of June One thousand nine hundred.

**Further know ye**, that We, reposing great trust and confidence in your ability and discretion, have appointed, and do by these Presents nominate, constitute, and appoint you, the said John, Baron Revelstoke ; William Robert Wellesley Peel ; Alfred Lyttelton ; Sir Robert Giffen ; Sir John Wolfe Wolfe-Barry ; Sir John Hext ; and John Edward Ellis, to be Our Commissioners for the purposes aforesaid.

**And** for the better effecting the purposes of this Our Commission, We do by these Presents give and grant unto you, or any three or more of you, full power to call before you such persons as you shall judge likely to afford you any information upon the subject of this Our Commission ; and also to call for, have access to, and examine all such books, documents, registers, and records as may afford you the fullest information on the subject ; and to inquire of and concerning the premises by all other lawful ways and means whatsoever.

**And** We do by these Presents authorise and empower you, or any three or more of you, to visit and personally inspect such places as you may deem it expedient so to inspect for the more effectual carrying out of the purposes aforesaid, and to employ such persons as you may think fit to assist you in conducting any inquiry which you may hold.

**And** We do by these Presents will and ordain that this Our Commission shall continue in full force and virtue, and that you Our said Commissioners, or any three or more of you, may from time to time proceed in the execution thereof, and of every matter and thing therein contained, although the same be not continued from time to time by adjournment.

**And** We do further ordain that you, or any three or more of you, have liberty to report your proceedings under this Our Commission from time to time if you shall judge it expedient so to do.

**And** Our further will and pleasure is that you do, with as little delay as possible, report to Us under your hands and seals, or under the hands and seals of any three or more of you, your opinion upon the matters herein submitted for your consideration.

Given at Our Court at Saint James's the sixth day of March, One thousand nine hundred and one, in the first year of Our Reign.

By His Majesty's Command,  
CHAS. T. RITCHIE.

# MINUTES OF EVIDENCE

TAKEN BEFORE THE

## ROYAL COMMISSION

ON THE

# PORT OF LONDON,

AT THE

SURVEYORS' INSTITUTION, GT. GEORGE STREET, WESTMINSTER, S.W.

### FIRST DAY.

*Tuesday, 6th November, 1900.*

PRESENT :

The Right Hon. The EARL EGERTON OF TATTON (*Chairman*).

The Right Hon. LORD REVELSTOKE.

Sir ROBERT GIFFEN, K.C.B., LL.D.

Sir JOHN WOLFE WOLFE-BARRY, K.C.B., LL.D., F.R.S.

Rear-Admiral Sir JOHN HEXT, K.C.I.E.

JOHN EDWARD ELLIS, Esq., M.P.

CECIL OWEN, Esq., *Secretary*.

(*Sir Homewood Crawford.*) Would your Lordship allow me to intervene for a moment before the examination of the witnesses begins. I represent the Corporation of London. We are very anxious to afford every possible assistance to the Commission, but we are in some doubt as to the order of procedure, and whether it is the intention of the Commissioners to allow any cross-examination of witnesses; or how the evidence is to be taken.

(*Chairman.*) I believe the Secretary has been in com-

munication with you, and given you all the information which it is at present in the power of the Commission to give.

(*Sir Homewood Crawford.*) He has not afforded me information as to whether any cross-examination of witnesses would be allowed.

(*Chairman.*) This is not the time to raise that question.

(*Sir Homewood Crawford.*) I am obliged to you, my Lord.

Mr. ROBERT PHILIPSON called and examined.

1. (*Chairman.*) You are the Secretary of the Conservators of the River Thames, and you have held that appointment since March last?—Yes.

2. Previously you held the post of Assistant Secretary to the Tyne Improvement Commissioners?—Yes.

3. Will you kindly read your statement of evidence consecutively?—The Conservators of the River Thames were incorporated by the Thames Conservancy Act, 1857 (20 & 21 Vict. cap. cxlvii.), and their jurisdiction extended from Staines in the County of Middlesex to Yantlet Creek in the County of Kent, and over the shores of the river so far as the tide flows and reflows between high and low watermark at ordinary tides. Prior to that date the Mayor and Commonalty and Citizens of the City of London from time immemorial had and had exercised the conservation of the River Thames from Staines down to Yantlet Creek, and claimed to exercise rights of ownership in the bed and soil of the river within those limits. In February, 1844, Her Majesty's Attorney-General exhibited an information in the High Court of Chancery against the Corporation for the purpose of establishing the right of the Crown to the bed and

shores of the river within the flux and reflux of the tide, and also to certain encroachments which had up to then been made on such shores. With a view to putting an end to the litigation, the Corporation acknowledged the title of the Crown, and an agreement was entered into on the 18th December, 1856, by the Corporation and a Commissioner of Her Majesty's Woods and Forests, whereby the Commissioner agreed to grant and convey, as from the 1st March, 1857, to the Corporation and their successors, as Conservators of the River Thames, the title and interest of the Crown to the bed and shores of the river. The agreement, however, expressly excluded bed and shores in front of or adjacent to Crown property, or property of a Government Department, and further provided, *inter alia*, that no license should be granted for any work in the river without valuation, and that one-third of the revenue derived from such licenses should be paid to the Crown, and the remainder applied to the improvement of the navigation. Pursuant to this agreement, the Commissioner of Woods duly conveyed to the Corporation by an Indenture dated 24th February, 1857, the title and interest of the Crown to the bed.

Mr. R.  
Philipson.

6 Nov. 1900.

Mr. R.  
Philipson.

6 Nov. 1900.

soil and shores of the river, subject to the foregoing reservation of Crown foreshores. By the Thames Conservancy Act, 1857, it was enacted that the Conservators, as a Body Corporate, should consist of twelve members as follows:—The Lord Mayor; two Aldermen of the City; four members of the Common Council; the Deputy Master of the Trinity House; one other member to be appointed by the Trinity House; two members to be appointed by the Admiralty; one member to be appointed by the Board of Trade. By the Thames Conservancy Act, 1864, under which various additional powers were conferred, six elective Conservators were added to the existing Board of twelve, as follows:—Two by ship owners; one by owners of passenger steamers; two by owners of lighters and steam tugs; one by dock-owners and wharfingers. By the Thames Navigation Act of 1866 the jurisdiction of the Conservators was extended from Staines to Cricklade, in the County of Wilts. Before the passing of this Act this portion of the river was under the control of a body called the Upper Navigation Commissioners, appointed under the Upper Navigation Act, 1795. With a view to efficiency and economy, the Act of 1866 placed the whole river under one management, viz., that of the Conservators, and five Conservators were added by the Act to the then existing Board of eighteen members, making twenty-three in all. The five members were to be appointed and elected as follows:—One by the Board of Trade; four to be elected by persons possessing the qualifications required for Upper Navigation Commissioners as described in the Upper Navigation Act of 1795. The Conservators' powers were extended and enlarged by various Acts passed in 1867, 1870, 1878, 1883, and 1885, but these Acts made no alteration in the constitution of the Board. In 1893 the London County Council obtained powers by their General Powers Act (Section 3) for seven additional members to be added to the Board, viz.:—Three to be elected by the Council, one to be elected by the Middlesex County Council; one to be elected by the Surrey County Council; one to be elected by the Kent County Council; one to be elected by the Essex County Council. The Act also contained a provision that the Conservators should in the Session of Parliament of 1894 introduce a Bill to consolidate and amend their Acts so far as regards the constitution of powers of the Board and that in the event of their failing to introduce such a Bill, or if such Bill failed to pass, to empower the London County Council to themselves introduce such a Bill in the next following Session of Parliament. The Conservators accordingly brought in a Bill in the following Session of Parliament to amend the constitution of and consolidate, amend, and extend the powers of the Conservators, and the Bill became the Thames Conservancy Act 1894. Part II. of that Act (Sections 5 to 57 inclusive) provides that the Board shall consist of 38 members and its constitution shall be as follows:—Appointed by the Admiralty two; by the Board of Trade two; by the Trinity House two; by the Gloucestershire and Wiltshire County Councils one; by the Oxfordshire County Council one; by the Berkshire County Council one; by the Buckinghamshire County Council one; by the Hertfordshire County Council one; by the Surrey County Council one; by the Middlesex County Council one; by the London County Council six; by the Common Council six; by the Essex County Council one; by the Kent County Council one; by the Metropolitan Water Companies one; by the Oxford City and County Borough one; by the County Borough of Reading one; by the County Borough of West Ham one. Elected—By shipowners, three; by owners of sailing barges, lighters, and steam tugs, two; by dock owners, one; by wharfingers, one. This is the present constitution of the Board. The principal powers and duties of the Conservators are:—(a) The general government and regulation of all vessels on the river within the port (Section 191), the upward limit of which is London Bridge (Section 3). (b) The improvement and completion of the navigation of the river (Section 62). (c) The appointment of Harbour Masters who may give directions for all or any of the following purposes:—(1) For regulating the time and manner in which any vessel shall enter into, go out of, or lie in the Thames, and the position, mooring or unmooring, placing or removing any vessel within the Thames. (2) For regulating the manner in which any vessel within the Thames shall take in or discharge its cargo, or any part thereof, or shall take in or deliver ballast. (3) For regulating the time and manner in which any vessel shall lie at any public draw-dock or landing place in the Thames, and the posi-

tion, mooring or unmooring, placing or removing any vessel lying thereat. (4) For regulating the manner in which any vessel lying at any public draw-dock or landing place in the Thames shall take in or discharge its cargo or any part thereof, or shall take in or deliver ballast (Sections 126 and 128). (d) The removal of vessels sunk or stranded, and of all other obstructions to the navigation (Sections 77 and 78). (e) Dredging for the purpose of maintaining and improving and freeing or keeping free from obstruction the navigation, and for this purpose the eastward limit of the Conservators' jurisdiction was extended so as to include so much of the estuary of the River Thames outside the limits of the jurisdiction of the Conservators of the River Medway, and so much of the shores of such estuary as are westward of a straight line drawn from the Shoeburyness Water Tower in the County of Essex, to Eastchurch Church in the County of Kent (Section 83). (f) The shortening of bends (Section 84). (g) The licensing of docks, piers, and embankments, and the licensing of stages and cranes below Teddington Lock for discharging vessels (Sections 109 and 110). The consideration for every such licence is to be such as shall be deemed the true or fair worth or value thereof to the Licensee by the Assessor appointed under the Act (Section 116). The Act provides (Section 109) that the consideration shall be either a sum in gross or an annual rent or partly a sum in gross and partly an annual rent. In practice the Assessor fixes an annual rent on works removable at seven days' notice under the section referred to, but assesses a sum in gross on embankments not so removable, but which, under Section 117 of the Act, are to be held by the same tenure as the land in front of which they are constructed. The Conservators themselves have fixed a scale of charges in respect of their licence for any work above Teddington Lock. (h) The placing and maintenance of moorings (Section 112). (i) The erection of piers and landing stages (Section 119). (j) The placing and maintenance of beacons necessary and convenient for the navigation (Section 135). (k) The making of bye-laws for any or all the purposes named in Section 191. (l) The carrying out of the provisions of the Explosives Act and the Petroleum Acts so far as they affect the river. The Conservators have, under the authority of their Act, made the following bye-laws:—(a) For the regulation of the navigation and the general government of the river (Thames Bye-laws, 1898). (b) For the protection and regulation of the fish and fisheries (Thames Fisheries Bye-laws, 1893). (c) For the regulation of the passage of vessels through the Tower Bridge (Tower Bridge Navigation Bye-laws, 1896.) The Conservators have made the following bye-laws under various powers as follows:—For the regulation of the conveyance, loading, and unloading of explosives on the river (as Harbour Authority under the Explosives Act, 1875). For the regulation of the conveyance of petroleum and carbide of calcium on the river (as Harbour Authority, under the Petroleum Acts, 1871 and 1879). For the regulation of persons and vessels using the Richmond Footbridge, Sluices, Lock, and Slipway (as undertakers under the Richmond Footbridge, Sluices, Lock, and Slipway Act, 1890). The Conservators do not own any docks or public wharves in the Port. I hand in a list of sufferance wharves.

(A list of Sufferance Wharves and Legal Quays was handed in. See Appendix, 1st day, No. 1.)

4. How many are there?—On the north side of the river there are 73, and on the south side 33.

5. Will you describe what these sufferance wharves are?—I understand that they are wharves at which dutiable goods may be discharged.

6. (Sir Robert Giffen.) I see you describe them as sufferance wharves and legal quays?—Yes; that is the technical expression under the Customs Act. The Conservators have placed and maintained a number of public moorings at which vessels load and unload, and no charge is made for this accommodation. Vessels loading or unloading there do so by means of their own cranes or derricks, as the Conservators have provided no machinery for such purpose. Vessels occupy the moorings for periods varying from two to fourteen days. I hand in a list of the moorings provided.

(A list of the Public Moorings on the Thames was handed in. See Appendix, 1st day, No. 2.)

7. (Chairman.) What do you describe a mooring as—a place where there is no wharf, and where the vessel temporarily lies?—Yes.

8. Are there permanent buoys?—Yes; to which the vessels are attached to load and unload cargo.

See  
3332-3.

Mr. R.  
Philipson.

6 Nov. 1900.

9. What is the number of the moorings?—55.

10. And how many vessels do they accommodate?—116.

11. Have you the range of tonnage of those vessels, in order to give the Commission an idea of the class of vessels?—I was going to put in a statement showing the number and tonnage of vessels which loaded and unloaded at these moorings during the three months from the 1st August to the 31st October.

(The statement was handed in. See Appendix, 1st day, No. 3.)

This statement gives the classification of them. The number of vessels is 953, with a net registered tonnage of 512,758.

12. (Lord Revelstoke.) That is in three months?—Yes.

13. Are they the three biggest months of the year?—I do not know that. They are the only months I could get.

14. (Chairman.) Have you the largest and the smallest tonnage? What do they range from?—They range from 200 tons to 600 tons.

See 3212. 15. Only 600?—Yes.

16. (Sir John Wolfe-Barry.) That is registered tons?—Yes. May I interpose at this stage. I received a letter from your secretary, stating that you would be glad to be informed as to the number of moorings in the river which provided accommodation for vessels discharging or loading from lighters; further, whether any, and, if so, what, facilities exist for the extension of the practice. I brought that letter before the Conservators, and they gave instructions for a chart to be prepared by their engineer, showing the existing moorings and showing also the positions at which additional moorings could be placed, extending the accommodation for vessels loading and discharging in the river. I have that chart here.

17. To vessels of what tonnage would that apply?—It would apply to all vessels above 45 registered tons.

18. Up to what?—I think the maximum tonnage of vessels so discharging and loading is something like 700 tons.

19. Have you no large vessels moored in that way; for instance, one employed in laying telegraphs?—I cannot answer that question at the moment. In connection with this chart I submit a statement giving the sites of the proposed moorings.

(A statement and chart as to the provision of additional moorings in the Thames was handed in. See Appendix, 1st day, No. 4.)

In addition to these moorings the Conservators have provided 62 moorings at various places for the use of barges, but have not exercised the power of charging for their use conferred on them by Section 157 of the Act.

See 2334 and 2369-2381. 20. (Chairman.) That section says that:—"The Conservators may from time to time demand and receive in respect of vessels not paying duties of tonnage leviable under this Act and using any of the moorings in the Thames belonging to the Conservators, the charges appointed by bye-laws of the Conservators for the time being in force." Are there any bye-laws in that respect?—No.

21. They have never exercised that power?—No.

22. Have they exercised the power under Section 155?—Yes. The Conservators are empowered to demand tonnage dues in respect of vessels entering and leaving the port. Coastwise and foreign ports north of Ushant one halfpenny per ton. All other ports three farthings per ton (Section 155).

23. And have they so done?—Yes.

24. What are the vessels exempt from tonnage dues?—The section provides that the following vessels shall be exempt from tonnage dues:—Any vessel trading coastwise between the Port of London and any place in Great Britain, unless such vessel shall exceed 45 tons tonnage; any vessel bringing corn coastwise, the principal part of whose cargo shall consist of corn; all fishingsmacks and lobster and oyster boats; all vessels for passengers only; any vessel entering inwards or clearing outwards in the Port of London in case her cargo is reported for exportation, and ultimately such vessel leaves the said port without breaking bulk or taking in goods for the purpose of exportation; any vessel entering the Port of London inwards or going from the said port outwards when in ballast.

4238

25. Have you a classified statement of the tonnage of vessels entering and leaving the port for the last five years?—I have taken it out for the last six years.

(A statement and classification of the number and tonnage of vessels entering and leaving the Port of London for the six years ending 1899 was handed in. See Appendix, 1st day, No. 5.)

26. (Sir Robert Giffen.) I should like to ask you whether these particulars relate to the Port, as you have described it at the beginning of the table, or to the Customs Port, which is not quite the same in extent?—They relate to the Port as described in the second schedule of the Act of 1894.

27. (Chairman.) Will you give us the totals of the tonnage of each year inclusive?—Vessels as well?

28. Yes.—1894, 41,152 vessels; tonnage 19,718,770. In 1895, 40,553 vessels; tonnage 19,815,610. In 1896, 43,581 vessels; 21,109,594 tons. In 1897, 43,551 vessels; 21,704,221 tons. In 1898, 43,343 vessels; 22,236,629 tons. In 1899, 46,099 vessels; 22,277,174 tons.

29. (Sir Robert Giffen.) These are the vessels entering and clearing?—They are vessels paying tonnage dues.

30. So that practically it doubles the number of vessels in one sense?—Yes.

31. You have them twice over, first as entering and then as clearing?—Yes, if they pay both in and out they are here twice.

32. Does it include vessels which do not pay dues as well as vessels which pay dues?—No, it does not include those that do not pay. It is merely vessels paying tonnage dues.

33. (Chairman.) Does it include the steamers which run to and fro between London and Continental ports?—Yes, if they pay tonnage dues.

34. Then they are counted several times over?—Yes; it may be.

35. But you have no statement of the vessels which do not pay tonnage dues?—No; I have not been able to get any details of them.

36. Have you compared them with figures given by the Customs?—No; I have not.

37. (Sir John Wolfe-Barry.) If a vessel comes in with cargo and goes out in ballast, it will appear only once, I suppose?—That is all.

38. (Chairman.) Then with regard to the Commissioners of Woods?—The Conservators are required to submit yearly to the Commissioners of Woods a return of all sales or licenses for any works in or upon the bed or shores of the river below Staines, showing the amounts received by the Conservators for any such sales or licenses, and are required to pay to the Commissioners on behalf of the Crown one third of the amounts in question (Section 239).

39. Have you got a return of what has been sold?—That appears in the annual accounts. The statement is shown in the published accounts.

40. I was rather wanting to know what are the annual sums that have been paid to the Commissioners, say, for the last five or six years?—I will give you that further on, when I submit the financial statement. Under an arrangement made with the Commissioners in 1899, the Conservators pay to them two-thirds of the consideration received for any licenses for works on foreshore in front of or adjacent to Crown property or property of a Government Department, which, as has been shown, was never vested in the Conservators, and the reservation of which was continued as necessity arose in the various Acts obtained from time to time by the Conservators (Sections 59 and 213 of Thames Conservancy Act, 1894). The Conservators' receipts and expenditure in respect of the Lower River up to Staines are kept distinct from their receipts and expenditure in respect of the Upper River from Staines to Cricklade (Sections 240, 241, 242, and 243).

41. You will give us that when you make your financial statement, I suppose?—Yes. The Conservators' revenue in respect of the Lower River is derived principally from the following sources:—Tonnage dues; Tolls—barge traffic (Section 160); Tolls—pleasure traffic (Section 163); Rents for jetties and other accommodations (Section 109); Dropping Licenses (Section 187). The total receipts and expenditure on

See 1683.

Mr. R.  
Philipson.

Revenue Account for the years 1894 to 1899, both inclusive, were:—

6 Nov. 1900.

	Receipts.	Expenditure.	Surplus.	Deficiency.
	£	£	£	£
1894 -	77,094	85,975	—	8,881
1895 -	78,305	72,118	6,187	—
1896 -	85,528	73,945	11,583	—
1897 -	88,316	67,580	20,736	—
1898 -	91,454	74,182	17,272	—
1899 -	91,331	86,703	4,628	—
	512,028	460,503	60,406	8,881
			8,881	
		£	51,525	Surplus.

I hand in here details of the whole of these figures. (A table showing the receipts and expenditure on Revenue Account of the Thames Conservancy for the six years ending 1899 was handed in. See Appendix, 1st day, No. 6.)

42. (Sir Robert Giffen.) I think perhaps you might state now the amount of income from the tonnage dues in each year, because that is the principal source?—In 1894 the tonnage dues produced £14,861; in 1895, £49,342; in 1896, £52,837; in 1897, £54,436; in 1898, £55,818; in 1899, £55,729.

43. So that most of the dues come from the  $\frac{1}{2}$ d. a ton, and not from the  $\frac{3}{4}$ d. a ton, is that so?—I have given the whole of the dues.

44. Comparing that with the tonnage itself, it must be for the most part at  $\frac{1}{2}$ d. per ton?—Yes, I think that is right; the average is  $\frac{3}{4}$ d. per ton.

45. (Chairman.) Can you separate the expenses above Teddington Lock from those below?—It is in the Lower River right up to Staines.

46. I meant to say Staines. Can you separate those?—I can give you the receipts from Staines to Cricklade.

47. (Lord Revelstoke.) There is no capital expenditure accounted for in these figures?—No, I will deal with that later. I find I have the detailed receipts and expenditure above Staines from 1894 to 1899.

48. (Chairman.) Then, in fact, the expenses of the upper part of the river are paid for partly by the dues coming from the lower part of the river?—No. This deficiency was supplied out of reserve income account. I will give you some other figures which will show that the upper river has paid for itself.

49. That is what we wanted to know?—The receipts in 1894 were £23,904, and the expenditure £28,137; in 1895 receipts £36,385, expenditure £27,783; in 1896 receipts £32,788, expenditure £28,906; in 1897, receipts £30,649, expenditure £29,918; in 1898, receipts £34,077, expenditure £38,939; in 1899, receipts £32,133, expenditure £32,206. Total receipts, £189,937; total expenditure, £185,793; balance, £4,144.

50. Has there been any improvement in the locks in the upper river?—They have been maintained, of course, and new locks have been built from time to time as necessary.

51. (Sir Robert Giffen.) Can you separate the receipts and expenditure between London Bridge and Staines?—I can do that. I have not the figures here. If you wish it I will get them.

52. (Sir John Wolfe-Barry.) I was going to ask the same question. I think it will be very material.

53. (Chairman.) The Act of Parliament defines the upper and lower river as between Staines to Cricklade and downwards?—Yes.

54. But practically the division would rather be from London Bridge to Cricklade, would it not, as far as the navigation is concerned?—Of course the tide flows to Teddington.

(Chairman.) But you have only seven feet at London Bridge, therefore up to London Bridge it is a different class of tonnage taken in that part of the river; whereas, of course, the river might be deepened up to London Bridge. There is no physical difficulty in the way, and the Commission wanted to know, if you could give us, what was expended on it.

55. (Mr. Ellis.) Our reference is to "the Port of London." What do you consider "the Port of London?" That is the point?—"The Port of London" is defined in one of these sections.

56. (Chairman.) But from physical reasons it must be below London Bridge?—Do I take it you would like the receipts from London Bridge to Staines, and the expenditure from London Bridge to Staines?

(Mr. Ellis.) We want the finance of the Port of London so far as you are concerned. That is really what it comes to.

57. (Sir John Wolfe-Barry.) London Bridge is the limit for sea-going craft; therefore it will be convenient to give it there for our purposes, although the Act of Parliament does not define it in that way?—I understand that sea-going craft go up as far as Lambeth.

Very small craft—

(Chairman.) Under 200 tons.

58. (Sir John Wolfe-Barry.) Yes. There are exceptional vessels carrying coal that go up as far as Vauxhall I know, but they are only a few. For practical purposes I think it will be of great use to this Commission to have the finance below London Bridge?—I will go into that question and see what I can give you.

59. (Chairman.) Then you were going to tell us about the surplus revenue?—I have handed in details of the figures which I have just read to you. This surplus revenue has been carried to what is called a Reserve Income Account, and with the exception of £9,194, and a balance of £1,368, has been applied to the purposes of Capital Works, viz.:—

Surplus Revenue as above	-	-	£51,525
Transferred to Craft Insurance Fund	-	-	£9,194
Balance unexpended	-	-	1,368
			10,562
			£40,963

The total expenditure on Capital Works from 1st January, 1894, up to the 31st December, 1899, amounted to £77,096, viz.:—

On new offices	-	-	£9,121
" new moorings for ships	-	-	999
" dredging	-	-	£17,392
" new steam hoppers	-	-	32,867
			50,259
" new steamer "Conservator"	-	-	10,513
" purchase of land	-	-	1,000
" Shepperton New Lock	-	-	5,204
			16,717
Total	-	-	£77,096

This expenditure has been met:—

1. Out of surplus revenues	-	-	£40,963
2. By the balance of money raised by the exercise of borrowing powers	-	-	12,107
3. Amount received for fines for accommodations	-	-	10,573
4. From the sale of Government stock, premises, etc.	-	-	13,453
			£77,096

60. (Sir John Wolfe-Barry.) Would you kindly explain the item of "dredging" in the capital account? Is that expenditure upon dredging operations or upon a dredger?—That, I understand, is upon dredging operations.

61. (Chairman.) I think we shall be able to get that better from the engineer.

(Witness.) I can put in a statement showing the expenses of dredging below London Bridge from 1858 to the end of last year, if that will help you.

62. (Sir John Wolfe-Barry.) My Lord said that probably that would come better from the engineer, but on this item in the account for dredging, £17,392, I wanted to know whether that was for dredging operations or the purchase of a dredger; because it seems to be expenditure of capital for some purpose or other?—I understand it includes plant as well.

(Chairman.) Then we will get that from the engineer.

63. (Sir Robert Giffen.) The charge for dredging applied to revenue would not include plant, would it?—No.

64. (Chairman.) Now will you hand in the annual reports?—This is a set of the yearly accounts.

(The yearly accounts of the Conservancy for the six years ending 1899 were handed in.)

See 1683\*

65. With regard to your borrowing powers, how have you exercised them?—The Conservators were, by the Act of 1894, authorised to borrow the sum of £200,000 for the purposes of the river below Staines, and they have exercised this power to the extent of £100,000 by the creation and issue of Debenture Stock, thus leaving an unexercised balance of £100,000. The Conservators have not found it necessary to raise further loans, as their receipts on revenue and capital account have been found sufficient to carry out the purposes named in the Act (Section 287 (1)), and they have thus avoided the increased charge for interest which further borrowing would have entailed. Moreover, the amount constituting the unexhausted borrowing power would have been altogether inadequate to meet the large and costly additional works referred to in the Report of the Lower Thames Navigation Commission.

66. With regard to that, I think we will ask those questions of the engineer. Now I want to ask you some general questions. How often are the meetings of the Conservancy Board held?—The Board meetings are held once a week.

67. I see your body is 38 in number?—Yes.

68. What is the usual attendance at the Board? Can you give us the attendances in the past year by name?—I can give you that.

69. A large number of the members of the Board represent counties above London Bridge?—Yes.

70. Do they attend and vote on questions affecting the Thames below London Bridge?—Yes; but I may say that the work is very largely done by Committees.

71. We want to know how the work is done.—These Committees are composed, in the case of the Lower River Committee, of Lower River representatives.

72. Entirely?—Well, practically, and in the case of the Upper River Committee, of Upper River representatives mainly.

73. Then the Conservancy Board is for all practical purposes two boards, which sit and meet together only on certain occasions?—Yes; for the convenience of doing the work the Board is divided into these Committees, and they report their proceedings to the Board for confirmation or otherwise.

74. And the accounts as far as Staines and upwards are kept separate from those of Staines and below?—Absolutely.

75. Now I should like to ask you some questions about the action of the Conservancy Board with regard to the recommendations of the Committee appointed by the Board of Trade in 1878, and whose Report was presented to Parliament in 1879. The Report says: "Your Committee are strongly of opinion that there should be one authority, and one authority only, empowered to make byelaws for the regulation of the navigation of the River Thames. They think further that this authority shall be the Conservancy Board who now represent all the principal interests on the river, rather than the Court of the Watermen's Company, who are self-elected, and, so far as they represent any interest, represent only a section of barge owners." Has any action been taken by your Board on the Report of that Commission?—I cannot say; I have not read the Report.

76. We shall require to know that. Of course, you have only recently been appointed Secretary, but this is a question of a Report made 20 years ago, and we shall require further evidence as to what has been done, or, if nothing has been done, the reason why nothing has been done.—Very good.

77. The Report goes on to say: "If these changes are made, it will probably be necessary to transfer the registration of barges to the Conservators. It is important that this registration should be continued, since without it, and without such name, number, or other distinguishing mark painted on the barges, it would be impossible to identify them and to enforce the regulations against them. These barges, though occupying the water space of the river and using the public moorings, now pay nothing towards the Conservancy Fund. They pay to the Watermen's Company, as follows:—On first registration, if owned by a freeman 10s.; if owned by a non-freeman £1; and annually, if owned by a freeman 2s. 6d.; if owned by a non-freeman 5s. If our recommendations are adopted, these fees will be abolished; and we suggest that for each barge whilst it remains on the register the owner should pay annually 10s. to the Conservators."—The barges are registered at Watermen's Hall.

78. That is what was the case in 1880; there has been no alteration?—There has been no alteration.

79. And no action has been taken?—None at all.

80. What is your practice with regard to the appointment of Harbour Masters—how are they licensed?—They are not licensed. The Harbour Master is, I believe, required to be a member of the Trinity House.

81. Are they licensed by Trinity House?—I see under Section 126 of the Conservancy Act of 1894, "No person shall be appointed by the Conservators to be a Harbour Master unless such person shall, after being duly examined by the Trinity House, produce a certificate from them of his proper qualification to be a Harbour Master."

82. Are the Harbour Masters appointed by the Conservators?—There is a Harbour Master and two Deputy Harbour Masters.

83. Where are they stationed?—The Harbour Master has his office at Temple Pier. One of the Deputy Harbour Masters controls the district between there and Woolwich. The other is stationed at Gravesend, and controls the district between there and Woolwich.

84. Then with regard to the policing of the river, what police have the Conservators?—They have not any.

85. You have had some experience on the Tyne Commission, have you not?—Yes.

86. That is governed by a representative body, is it not?—Yes, by an elected body.

87. And under that elected body large sums of money have been spent in the improvement of the navigation?—Yes. If it is any assistance, I can give you the constitution of the Tyne Board.

88. We have that. I merely wanted to ask you a question or two generally as to the working of the Tyne Board. How do they obtain their revenue?—They obtain their revenue from rates and dues on shipping, and on goods and coal carried by the shipping.

89. Are they subsidised in any way by the Municipal rates?—No.

90. Have that body complete control over the whole river, or are there other bodies, as there are in London, competing with them or concurrent with them?—They have complete control over the river for about nineteen miles from the entrance, and the whole of the docks in the river with the exception of Tyne Dock, which is owned by the North Eastern Railway Company. They have control of the lighting of the Port, but not over the pilots; that is in the hands of a body called the Tyne Pilotage Commissioners.

91. (Sir Robert Giffen.) Do they levy dues on all shipping going into the river whether it goes into their docks or not?—Yes.

92. On all shipping?—On all shipping, and if the ships go into the Commissioners' Docks they pay dock dues in addition.

93. They levy dues on all shipping?—River tonnage dues are chargeable and paid on all shipping whether going into the Commissioners' own docks or into the dock of the North Eastern Railway Company.

94. (Chairman.) Have they more powerful dredgers there than you have in the Thames?—I would not like to say that.

95. You are not prepared on behalf of the Conservancy to make any statement with regard to the carrying out of the Report of the Lower Thames Navigation Commission—not merely as an engineering question but generally. Have you anything to say on behalf of the Conservancy on that subject?—No.

96. You are not instructed to say anything?—No.

97. Since this Royal Commission has been appointed have any meetings been held of the Thames Conservancy Board?—Yes, they meet every week, as I said before.

98. Has any action been taken with regard to this Commission?—No, they have not discussed any policy yet. See 1589-93.

99. You are not instructed on behalf of the Board to make any suggestion or representation to this Royal Commission?—No, for this reason—the matter has not yet been discussed.

100. Is it going to be discussed?—Yes, I quite expect it will.

Mr. R. Philipson.

6 Nov. 1906.

Mr. R.  
Philpson.

6 Nov. 1900.

See 1384.

101. No time has been fixed for it. The result of the discussion if any policy is arrived at will be conveyed to you no doubt by the Chairman of the Board.

102. Is the Chairman of the Board prepared to give evidence?—Yes. If he is called upon to do so he will. I should like to add that if any invitation is sent to the Conservators from yourselves they will no doubt consider their policy and convey it to you through their Chairman.

103. But I understand that the invitation to appear before this Royal Commission was given by our Secretary to you as Secretary of the Board, and of course that invitation must necessarily have been laid by you before the Chairman, and the Royal Commission certainly would expect that the Chairman, unless he authorised the secretary to speak on behalf of the Board, should himself appear to state the policy of the Board, and reply to any questions which the Commission may have to ask him?—It was felt no doubt by the Chairman of the Board and the Conservators that you required technical details of the powers and income and expenditure of the Conservators.

104. But that is not the only part or perhaps the most important part of the duty of the Commission. Perhaps you will convey this to the Chairman, and we should like to know whether he will be able to appear at an early date?—Very well.

105. (Sir John Wolfe-Barry.) There are two questions I want to ask you with regard to the Thames Traffic Committee which made certain recommendations as to the regulation of traffic on the Thames and particularly of barge traffic and towing and matters of that kind. Can you tell us whether it is the view of the Conservators that they are already in possession of powers to regulate such matters, or would they require further legislation?—I believe the Conservators have already sufficient power to control all navigation.

106. To make bye-laws as to such matters as the towing of barges and the number of men to be employed on the barges?—I think they have already made regulations with regard to the towing of barges. I am not sure whether they have limited the number of men.

107. Can you tell us what has been done with regard to the recommendation of that Committee which says: "As regards towing we think that a rule may properly be made requiring all dumb barges navigating the whole distance between London Bridge and the uppermost of the dock entrances in Blackwall Reach to be towed?"—The Conservators have made these two bye-laws on that question: "All vessels navigating the river shall be navigated singly and separately except small boats fastened together or towed alongside or astern of other vessels, and except vessels towed by steam. Vessels towed by steam navigating the river below the Albert Bridge at Chelsea shall, if more than two in number, be placed two abreast (except vessels trading on any canal and not exceeding 14 feet 9 inches in width, which may be placed three abreast), and not more than six of such vessels shall be towed together at the same time, and no tow of vessels shall exceed in length the following limits, namely:—Above London Bridge, 400 feet; between London Bridge and the landing place at the end of Trinity Street, Charlton, 320 feet. Below the said landing place, 400 feet, to be calculated from the stern of the vessel towing to the stern of the aftermost vessel towed.

108. That does not quite answer my question. The question was whether they made any regulations in accordance with the recommendation of the Thames Traffic Committee, which says that they think "a rule may properly be made requiring all dumb barges navigating the whole distance between London Bridge and the uppermost of the dock entrances in Blackwall Reach to be towed?"—No, I do not think so.

109. No regulation of the kind has been made?—No.

110. But you think the Conservancy have the power to make such a regulation if they saw fit?—The solicitor of the Board is here if you care to call him on that point.

111. There is one other point I wanted to ask you a question about, and that is as to the expenditure. Can you tell us why the expenditure went up something like £12,000 between 1898 and 1899?—In 1898 the amount spent in dredging below London Bridge was £12,302; in 1899 it was £24,037.

112. Can you tell us why this large additional expenditure began between 1898 and 1899? One wants to know what is about the normal expenditure; that is the object of my question. Perhaps the engineer will give it?—The engineer will answer that better.

113. (Chairman.) There are several questions with regard to the police which are mentioned in this Report. but I understand you that you do not know anything about that.—The policing of the river is done by the Metropolitan Police.

114. But if you look at the evidence given before the Thames Traffic Committee there are recommendations that there should be one authority for the river, and that the Conservancy Board shall be that authority?—I confess I have not seen that evidence.

115. (Mr. Ellis.) There are some questions I want to ask you with regard to the powers of dredging and other powers under your Act of 1894; but if you say that the Solicitor will answer that better than you I will defer it until the Solicitor comes.—Yes; I think that will be better.

116. You have only been Secretary since March?—Yes.

117. But you are Secretary of the Board?—Yes.

118. You attend the Board meetings?—Yes; all meetings.

119. You are present at all of them?—Yes; always.

120. I notice the income has not gone up much from 1899 as contrasted with 1898. Is it a growing income now? Will it be more for 1900?—Very little. Up to the present time I should think it is not more than £2,000 more than in 1899.

121. Is the want of income any bar to your operations?—Most undoubtedly; if we had more money we would be able to spend more.

122. Just let me call your attention to Section 189 of the Act of 1894—the last words: "if any dredging or other operations shall be recommended in the Report of the said Commission" (that is the Barry Commission) "the Conservators shall as soon as may be reasonably practicable after a copy of such Report shall have been received by them as aforesaid, either proceed to carry out such dredging or other operations, or apply to Parliament for all such powers as shall be desirable to enable them to give effect to the recommendations of the said Commission." That is what we call in the House of Commons a mandatory recommendation. Has that ever been discussed by the Board in your presence?—No.

123. Are there any minutes bearing upon any discussion by the Board on those words?—I cannot say. It was before my time.

124. If you say you do not know, I will take that answer.—The engineer will be able to tell you.

125. (Chairman.) We shall certainly require to know it. You do not mention anything about a debt; what debt have you?—On the Lower River Fund we owe £100,000.

126. On page 21 of the evidence before the Barry Commission some questions are asked about the debt on the Upper Navigation: "An outstanding debt of about £78,000, and the old Commissioners' debt, on which no interest has been paid since 1863." Can you tell us anything about that?—The debt on the Upper River account is £110,000.

127. Is that included in your financial statement?—It is in the statement of accounts.

128. About this old Commissioners' debt on which no interest has been paid—has that been cleared off, or what has happened to it?—It is practically cleared off.

129. (Rear-Admiral Hext.) You stated just now that the Conservancy had not exercised their power to charge fees for moorings?—That is so.

130. Can you give any reasons for their not exercising that power?—The matter was fully discussed some years ago; all interests were represented, and it was considered inexpedient to make any charge.

131. Upon what ground?—I do not know that. I have got a copy of the minute here. It simply states what I have stated—that the matter was discussed, and it was decided not to make any charge.

132. With reference to the list of vessels using the moorings, are the same vessels counted twice over?—Yes.

133. They would be, I presume?—Yes.

134. (Sir Robert Giffen.) With reference to the list of sufferance wharves and legal quays which you have put in, that does not include every place, does it, where ships may load and unload besides the docks?—No; it does not include private wharves, for instance.

See  
7569-72.

135. There are private wharves besides?—Yes.

136. You have no list of those to give us?—No.

137. You have control over them, I presume?—Only so far as navigation is concerned.

138. Then what is the distinction between a sufferance wharf or legal quay and other places where a ship may load and unload?—I take it that a sufferance wharf or legal quay is a place where dutiable goods may be landed.

139. That is the distinction?—Yes; that is under the Customs Laws Consolidation Act.

140. Then with regard to the average tonnage dues of about  $\frac{3}{4}$ d. per ton, which seems to be the income which you get from the ships which you do make a charge upon, will you tell us what is the similar charge made by the Tyne Improvement Commissioners, with which you have been connected?—Coastwise  $\frac{1}{4}$ d., foreign  $\frac{3}{4}$ d. per registered ton, in and out.

See 1330.

141. That is upon all shipping, without any exemptions?—Yes.

142. Then if you had similar powers of charging shipping in the Port of London, you would increase your income very largely?—To a very large extent indeed.

See 20, 21, 2334, 2369-81.

143. Three or four times, perhaps?—Yes, all that. Besides, there are many other charges on the Tyne which do not obtain on the Thames.

144. Of what kind?—Such as the charge for moorings. Every vessel entering the Tyne with cargo and leaving with cargo pays a mooring rate of  $\frac{1}{4}$ d. per registered ton, and if a vessel loads or discharges a cargo in the river at public moorings owned by the Commissioners she pays coastwise  $\frac{1}{4}$ d. per registered ton, and foreign  $\frac{2}{4}$ d. per registered ton.

145. Then has the question ever been before the Thames Conservancy Board as to the expediency of increasing these charges or dealing with them in any way with the object of improving the Port of London?—Not to my knowledge.

146. You have no information to give us as to the policy of the Thames Conservancy in these matters?—No. So far as I know the question has not been under the consideration of the Board.

147. And particularly as to the question of exempting different classes of ships you have no information to give us as to the reason for so doing?—No. That is an exemption that has been continued since 1834.

148. It belongs to a time long past, and has not been considered with reference to the kind of traffic which now takes place and the conditions of the Port of London as they now stand?—Just so. The powers for charging the tonnage rate which was levied by the Conservators were fixed in 1834. These exemptions were fixed at the same time, and have simply been continued from that time to this.

149. Is there any charge on lighters or barges by the Tyne Improvement Commissioners?—No.

150. So that they are completely exempt in the Tyne as they are in London?—Precisely, below Bridge.

Mr. JAMES HUGHES called and examined.

159. (Chairman.) You are solicitor to the Thames Conservancy?—Yes.

160. How long have you been solicitor?—I was appointed in May, 1889. That is roughly about 12 years.

161. There are several points which the Secretary of the Conservancy has been unable to give us information upon. Perhaps as you have been present you will be able to make some statement with regard to the questions which we have raised?—I made a note of two or three. Might I mention this in the first place? You put a question to the Secretary with regard to the Board and its Committees. The position is this: there is no division of the Board; there is one Board, two principal Committees, one dealing with matters relating to the river below Staines, the other to the river above Staines. Those Committees' reports are submitted to the Board and confirmed by the Board. There are again two funds, the upper and the lower; one applicable above Staines and one below.

162. What I want to know is whether those who represent the interests above Staines vote on all the questions affecting the river below Staines; that is to say, below London Bridge?—Yes, they can act in Board assembled.

151. (Chairman.) They are not much used there, are they?—No, the barges there are of a different class. They are a smaller craft which we call lighters—not nearly such a formidable craft as barges here.

Mr. R. Philipson.  
6 Nov. 1900.

152. (Sir Robert Giffen.) Then with regard to the constitution of the Thames Conservancy can you give us any reason why the numbers representing the ship-owners and lightermen and wharfingers were fixed as they are at present, both with reference to the other members of the Conservancy Board and with reference to each other?—From my reading of the evidence on the Bill of 1894, the question of representation seems to have been very largely dealt with and fiercely fought out. It was difficult, no doubt, to meet the many claims for representation.

153. Can you give us any idea of the reasons why these particular proportions were fixed upon?—No, I cannot do that.

154. Why the ship-owners, for instance, have three, and the dock-owners, one, and points of that kind?—No, I cannot tell you.

155. (Chairman.) The Commission would like to draw the attention of the Chairman of the Conservancy to some recommendations in the report of the Committee appointed by the Board of Trade affecting the Conservancy, and they would like to have some questions answered with regard to those recommendations, and why they have not been carried out, especially with regard to the general jurisdiction over the river. That question was fully gone into by that Committee, and recommendations were made upon which the Commission would like to inquire the views of the Conservancy at the present time?—I will take care to convey that.

See 1384.

156. And we should like to have particulars of the attendance of members in the last year or two?—Yes.

See 1683

157. (Sir John Wolfe-Barry.) With reference to the answer you gave to Sir Robert Giffen about tolls on the Tyne, I suppose I should be right in saying that the amount of traffic which enters in ballast and goes out laden on the Tyne is very much larger than on the Thames. I mean the number of ships that come in in ballast and go out laden with coal must be very large as compared with the number of ships which frequent the Thames and make either the journey in or the journey out in ballast?—Yes, that is so.

158. That would be a qualification, at any rate, with regard to the question of the tolls. The conditions are not the same?—That is so.

(Sir Homewood Crawford.) My Lord, would this be a convenient time to ask the Commission whether they intend to allow witnesses to be cross-examined?

(Chairman.) I have already given you your answer, and I am very sorry you should think it necessary to ask me again. I can give you no further answer. There is a communication in the "Times" this morning stating what will be done by the Commission, and the order in which the evidence will be heard. More than that I cannot tell you.

(Sir Homewood Crawford.) I am much obliged to your Lordship.

Recalled 7542

163. But as a matter of fact do they?—Yes.

164. What is the reason why no action has been taken to carry out the recommendations in the Report of the Barry Commission?—With submission I think the engineer will endeavour to show you that we have carried them out to a very great extent. I think that will come from the engineer. The whole matter was considered immediately the report was received, and it was debated at considerable length. The engineer was instructed to report, and he did, and certain work was carried out afterwards which he will detail.

Mr. J. Hughes.

165. How have you carried out this latter part of Section 189 of the Thames Conservancy Act, 1894: "If any dredging or other operations shall be recommended in the report of the said Commission the Conservators shall as soon as may be reasonably practicable, after a copy of such report shall have been received by them as aforesaid, either proceed to carry out such dredging or other operations, or apply to Parliament for all such powers as shall be desirable to enable them to give effect to the recommendations of the said Commission." Now the said Commission recommended that a navigable depth of about 30 feet, suitable for vessels of the largest

Mr. J.  
Hughes.  
6 Nov. 1900.

draught, should be afforded at least up to Gravesend.—I had rather you put that question to the engineer, because he can explain the figures.

166. I am asking with regard to this particular clause of the Act of Parliament. You are either to carry out such dredging or other operations, or apply to Parliament for all such powers as shall be desirable to enable you to give effect to the recommendations of the Commission. It is a matter of notoriety that that has not been carried out. I want to know from you as solicitor how it is that you have not acted upon this clause in the Act of 1894?—I am afraid I cannot answer. The Conservators in carrying out the report of, or the course advocated by, their engineer, thought that they were doing as much as they possibly could towards carrying out Sir John Wolfe-Barry's recommendation.

167. But if you could not carry it out you were to apply to Parliament for all such powers as shall be desirable to enable you to give effect to the recommendations of the said Commission?—It was not thought desirable that we should go to Parliament again. We had been there recently.

168. Then you did not carry out the recommendations?—We did not regard them as mandatory.

169. As the legal adviser of the Conservancy Board, ought you not to have instructed your Board to apply to Parliament?—I am afraid I cannot agree. I should be more inclined to advise the Board that if they had done everything that they could possibly do to carry out Sir John Wolfe-Barry's recommendations they had done all that was necessary, and it was not incumbent upon them to go to Parliament.

170. (Sir John Wolfe-Barry.) I should like to make me little correction. It was not a personal recommendation of mine,—No, the recommendation of the Commission.

171. It really was the joint report of Admiral Nares and Mr. Lyster?—It is referred to very often in your own name.

172. (Sir Robert Giffen.) Then the Conservators do not recognise that they are guilty of disobedience to an Act of Parliament?—I am afraid not.

173. (Chairman.) Perhaps the Chairman of the Conservators will be able to go further into this matter, but there are certain recommendations in the report of the Thames Traffic Committee. There are several questions with regard to which we should like to know if the Thames Conservancy Board have considered them. I will call your attention to a recommendation of this kind—"In this place it may be sufficient to say that on the Thames, as in other harbours of the United Kingdom, the tendency of modern legislation has been to place the whole authority over matters connected with navigation in the hands of one body, representing more or less completely the different interests concerned in it. Such a body, in the case of the Thames, is to be found in the Thames Conservancy Board, and your committee are of opinion as will be seen by their specific recommendations, that it is to this Board that the public must ultimately look for the efficient supervision of the navigation and for the performance of duties hitherto entrusted to various bodies. No action has been taken upon that?—That is prior to the date of my appointment. The Committee reported in 1879, but as a matter of fact, I understand the report was considered most carefully by the then Conservators.

174. And nothing was done, or what was done?—I can hardly say what was done or left undone. It was before my time. I could deal with some of these smaller matters, such as the towing of barges and so on, but on the question of policy I am afraid I could not say.

175. Will you state what is within your knowledge as to what has been done in order to meet the recommendations of this Committee appointed by the Board of Trade?—I am afraid I am not in a position to state anything of my own knowledge with regard to the Committee's Report.

176. Who is able to give us this then?—Mr. More, the engineer, has been engineer during the whole time.

177. These are not questions of engineering.—No; but we are in this difficulty: the Secretary, as you are aware, has only recently been appointed, and consequently he cannot be expected to know.

178. But I presume the Board has acted with regard

to all legal questions upon your advice or the advice of your predecessor?—Yes, since 1889.

179. And nothing has been done, to your knowledge, to carry out those recommendations?—Not that I could speak of from my own knowledge.

180. But surely you must be aware of everything that goes on in the Board?—I am present at the Board and hear everything that is debated at their meetings, true; but I have never heard this Report debated or any portion of it. It was prior to my time. It was ten years before my appointment. The then Chairman of the Board, I would remind you, was a member of the Committee—Admiral Sir Frederick Nicolson. It was a Board of Trade Committee, and he was put on, and Lord Farrer.

181. (Sir Robert Giffen.) Lord Farrer was a member of the Committee of 1879, but he was not a member of the Thames Conservancy Board.—No.

182. (Chairman.) And you have never had occasion at your Board to consider the question of the Watermen's Company. There were very strong recommendations which practically amounted to the abolition of the Watermen's Company?—No, I cannot say that it has ever been discussed in my presence.

183. (Sir Robert Giffen.) Have you any minutes of the Board dealing with the recommendations of the Committee of 1879?—The whole of the minutes can be produced.

184. (Chairman.) On page 48 of the Thames Traffic Committee's Report there is this paragraph relating to the relations between the Conservators and the Watermen's Company:—"It will be seen from what is stated above (pp. 32, 34) that many of the bye-laws of the Watermen's Company are upon the same subjects and cover the same ground as those of the Conservators. And it is a matter of well-founded complaint by several witnesses, and amongst others, the chairman and members of the company, that the bye-laws of the two bodies do clash in some important particulars. Your Committee are strongly of opinion that there should be one authority, and one authority only, empowered to make bye-laws for the regulation of the navigation of the River Thames. They think, further, that this Authority should be the Conservancy Board, who now represent all the principal interests on the river, rather than the Court of the Watermen's Company, who are self-elected, and so far as they represent any interest, represent only a section of barge-owners." Has no action, either from your knowledge or from an examination of the books, been taken in consequence of that recommendation?—The accounts of the Watermen's Company are audited annually by an official appointed by the Conservancy. Beyond that no action was taken to my knowledge.

185. What means does the Board take to enforce your rules? There is a very long list of things that you have to do?—Our rules, I might say, are comprised in our bye-laws. Since the Act of 1894, a Special Committee was appointed to consider the question of making bye-laws under Section 191, which contains the whole of our powers with regard to making bye-laws of any sort or kind. The Committee went very thoroughly into the old bye-laws. They added to, amended, and somewhat repealed, and the result was that in 1898 fresh bye-laws were made, which I am prepared to hand in.

186. The question I asked you was what means have the Conservancy Board of enforcing these regulations or bye-laws. Do they act with the Metropolitan Police?—That is a question that is hardly for me, but the river is policed in one sense from one end to the other. The harbour-masters in the tideway have considerable staffs.

187. The last witness said there were only three heads. What is the staff under them?—I cannot give it you exactly, but if you would not mind taking it generally from me, they have boatmen and assistants under them. There is one harbour-master and two deputies, and they have a considerable staff under them.

188. How far do they enforce the rules and regulations and bye-laws of your Board? What police powers have they?—They have no police powers.

189. How do they see that the rules and regulations are carried out. Supposing there is an infraction of

your rules and regulations, what happens?—It is reported to the head office, put into my hands, and if the evidence is sufficient there is a summons.

190. Is it brought before the Courts in the ordinary way?—Yes, before Courts of Summary Jurisdiction in the nature of summonses; and if the Commissioners desire to see it—it was handed in to the Board of Trade Commission in 1894—I have the Convictions Book which I have kept during the period I have acted as legal adviser to the Conservators. The actual convictions each year are very numerous.

191. For breaches of your bye-laws?—For breaches of the byelaws and breaches of the Explosives and Petroleum Acts and Bye-laws.

192. How far do you act with the police?—The police report to us. They patrol the river.

193. Have you steam launches to patrol the river?—Yes; but if the police see any contravention of the Thames Conservancy Act, that goes to Scotland Yard, and it comes from Scotland Yard to us immediately. In fact, the course with regard to proceedings is this: the complaints are put into my hands immediately they come into the head office.

194. Do you regulate in any way the operations of the barges, that is to say, do you see whether they are left and not properly attended to?—Yes, the harbour-master and the officials under him have instructions from the Conservators to regulate the whole of the traffic, barges and everything else, in the river.

195. And do they do so?—Yes.

196. Have the prosecutions that you have instituted, the effect of rendering the infraction of bye-laws less frequent?—Yes. In the case of vessels you may say that there are very few instances of disobedience to the harbour-master's orders in the course of a year.

197. They have powers only for the river?—Yes. They have no power in the docks at all. Our powers are really ample as they stand at present under the Act of 1894. They are ample for the navigation of the river.

198. Supposing anyone wanted to set up a new mooring place or a new wharf, what happens?—The course of procedure is that he makes application to the Conservancy on the form that is kept in the office, which is practically in the form of an agreement. That is submitted to the officials, the harbour-master, and the engineer, to report on. It is then considered by the Board, and if it is not considered to be in any way an obstruction to the navigation or a detriment to the navigation, the license is granted, subject to the assessment as provided by the Act.

199. Can you tell us how many licenses of that kind have been granted in the last five years?—I am afraid I could not, but it is a great many.

200. We want to know whether there is an increasing number of these applications to moor or make lay-byes?—The information shall be afforded to you.

See 1683.

201. (Sir Robert Giffen.) You said that minutes are in existence showing how the Thames Conservancy have dealt with the recommendations of the Committee of 1879?—Certainly.

200. We want to know whether there is an increasing room; the whole of the minutes of the Conservators from 1857 are at the disposal of the Commissioners at any time. They are kept.

203. I think we should like to have the minutes dealing with the Thames traffic and the recommendations of the Committee of 1879?—You shall have them.

204. Nothing has been done in the last ten years I understand?—Not to my knowledge, except that I may point out that our byelaws cover a good deal of the recommendations of the Committee.

205. (Chairman.) That is what I asked you and you have satisfied me that something has been done?—Yes. The question of towing, of course, has been considered over and over again, and the question of the lights on barges and various other things that are mentioned. The byelaws are, as they stand, I may say, very complete.

205A. (Mr. Ellis.) I wish to ask you a few questions with regard to your dredging powers. If you turn to the Act of 1894 I think they are contained in Sections 83 to 89, are they not?—Yes, they are principally in Section 83.

4238.

206. Are you aware whether the Conservators have at all times found those powers sufficient?—Yes. I can say within my knowledge that they have found them sufficient.

207. You have no desire or need to go beyond those?—No, I think not. These powers were the subject of a well-known decision in the House of Lords comparatively recently.

208. Then with regard to income: Your powers as regards income I think are mainly in Sections 155 to 158?—Yes, that is so, and also, of course (which is very important), the amounts received in respect of licences granted under Section 109.

209. Then we will add 109 to those, and say 109 and 155 to 158 inclusive?—Yes.

210. Have those powers been found sufficient?—Yes.

211. I am asking you as solicitor. I am not asking you as a question of policy or engineering?—Yes—the powers.

212. No improvement is desired as regards the matters comprised in those powers?—No, I think not.

213. Then I am afraid I must press you a little further with regard to these words at the end of Section 189. The position is this: You are solicitor to a very important public body created by the Act of 1894. It is not a question of the recommendations of Sir John Wolfe-Barry's Commission. It is a question of what Parliament intended. Parliament used these words: "If any dredging or other operations," and so on. The first question I want to put to you as solicitor to the Board is this. You would have that brought before you, of course. You would consider that?—To answer candidly, I cannot say that it was brought to my attention directly.

214. Did you ever read the Act of 1894?—Do you mean our own Act?

215. Yes.—Yes, several times. The first thing that was considered by the Conservators, and the main question, was what dredging should be done to carry out the recommendations of the Commission. The legal question was never put to me directly.

216. Then you never considered the bearing of these words upon the operations of your Thames Conservancy Board?—No, I cannot say that I have.

217. (Sir John Wolfe-Barry.) I asked the question of Mr. Philipson about compulsory towing. Do you hold that you have the powers to carry out the recommendations with regard to compulsory towing on page 24 of the Report of the Thames Traffic Committee?—Perhaps we have, but I am rather inclined to think that it would be a straining of our powers if we made such a sweeping bye-law as that would be under the power contained in Section 191. I would rather myself, as a lawyer, see the express power.

218. Supposing you made a bye-law of that kind, would you call the trade together and hear their views?—Yes.

219. That would be the natural course of events?—It is the course adopted by the Conservators in all these questions of river policy.

220. Assuming you have the power under the Act of Parliament, the parties would be fully heard before the bye-law was made?—Yes, and further than that, there is a publication of the bye-law necessary. They are heard at the Board of Trade again.

221. It is subject to appeal, is it not?—Practically the appeal is to the Board of Trade, and in the case of these bye-laws of 1893 we were before the Board of Trade for a considerable period. All interests on the river were represented. There was a great question then as to the lights on dumb barges.

222. Has the matter of compulsory towing ever been brought to your notice as solicitor to the Board?—No, not beyond dealing with it in the bye-laws.

223. This recommendation therefore has never had any attention paid to it?—Yes. I happen to know, but I cannot say of my own knowledge. It was thoroughly debated at the time, and it was not thought desirable in the interests of those using the river to make any alteration.

224. You mean that the Conservators exercised their judgment upon it, and considered that it was unadvisable?—Yes. I take it that the Minutes which the Chairman has desired to see will probably clear that point up.

225. Now I want to ask you this with regard to the recommendations of the Commission of 1894. The Secretary stated in his evidence that the apparent reason for

Mr. J.  
Hughes.

6 Nov. 1900.

Mr. J.  
Hughes.

6 Nov. 1900.

not doing anything was the unexhausted borrowing powers of the Board. It is put in these words: "Moreover, the amount constituting the unexhausted borrowing power would have been altogether inadequate to meet the large and costly additional works referred to in the Report of the Lower Thames Navigation Commission."—Yes.

226. That seems to state that the difficulty is financial, and that you are not carrying it out on account of the difficulty of finance?—I had rather the engineer answered that question; possibly it may be the expense.

227. We have to deal with the evidence of the Conservancy Board. The Secretary distinctly states here that the difficulty is finance?—I see no reason to doubt it.

228. It is not that you are carrying it out, but that you

cannot carry it out on account of finance. Is not that the fact?—I can only put it in this way. The more money at the disposal of Mr. More the engineer, the more work can be done.

229. Is it not really the fact that finance is the difficulty?—Finance is, generally speaking, a difficulty. It is a question of cutting your coat according to your cloth.

230. Then in that case, would it not have been a right course for the Conservancy to have applied to Parliament as provided by Section 189, which has been referred to more than once?—I assume that if we had gone to Parliament it would have been to obtain further financial powers.

231. Would not that be the precise power which was contemplated by Parliament in Section 189 of the Act of 1894?—Yes; perhaps so.

Mr. C. J.  
More.

Mr. CHARLES JAMES MORE called and examined.

232. (Chairman.) You are engineer of the Conservators of the River Thames, and you are a member of the Institute of Civil Engineers?—I am.

233. You have been 17 years engineer, and were previously assistant engineer for 13 years?—Yes.

234. Will you state the powers of the Board with regard to dredging and the disposal of the material dredged?—The powers of the Conservators with regard to dredging and the disposal of the material dredged are contained in Sections 83 to 89 of the Thames Conservancy Act, 1894 (57 and 58 Victoria, cap. 187). By Section 189 of that Act it was provided that the Conservators should apply to the Board of Trade to appoint a Commission to enquire and report to the Board of Trade:—(1) Whether any and what dredging or other operations are practicable and expedient for the purpose of improving the navigation of the Thames and the estuary thereof between Thorney Creek, in the County of Essex, and the Nore Lightship; (2) as to the probable cost of such dredging and other operations (if any) which the said Commission may deem practicable and expedient, and as to the means by which the funds necessary to meet such cost should be provided.

235. The Lower Thames Navigation Commission made their report?—They did.

236. Will you state what steps the Conservators took to carry out generally the recommendations contained in that report?—The Conservators considered this report very carefully, and at a Board Meeting of the 22nd June, 1896, they adopted a modification of the programme, which was laid before the Commissioners, and referred to in paragraph 31 of their report.

237. That was your proposition?—That was the proposition laid before the Commissioners when they sat. Then the Board adopted the modification, as follows:—They proposed to dredge between the Nore and Gravesend for a depth of 26ft. and a width of 1,000ft.; that is, to provide a channel of the minimum widths and depths which I have mentioned. Then between Gravesend and Crayford Ness to a width of 1,000ft. and a depth of 24ft. at low water spring tides; between Crayford Ness and Albert Docks to a width of 500ft. and a depth of 22ft.; between Albert Docks and Millwall Docks to a width of 300ft. and a depth of 18ft. In November, 1896, tenders were advertised for to dredge at least 300,000 cubic yards of material in the Lower Hope and in Gravesend Reach, and deposit the material dredged in the Barrow Deep within a specified area. The area to which reference is made is agreed to by the Board of Trade as a place of deposit for dredging purposes. In the following January the tender of the London and Tilbury Lighterage and Dredging Company was accepted by the Conservators. Under this tender during 1897 and 1898 a quantity of 191,000 cubic yards of material was dredged in the Lower Hope, and 174,000 cubic yards in Gravesend Reach.

238. (Rear-Admiral Hext.) But that is more than 300,000 cubic yards?—Yes; that was the minimum, and we exceeded that by 65,000 yards.

239. (Chairman.) Is that all that you thought necessary in order to carry out the depth of 30ft. which was recommended?—The question about the recommendation of 30ft. is not quite what the Conservators thought it was.

240. At page 33 they say:—"With this in view they"—that is, the shipowners—"unanimously demanded much larger works than are proposed by the Conservators, viz., a navigable channel of 30ft. below low water of spring tides at least"?—Yes; and the Com-

missioners concurred with the view of the shipowners, but if you look at paragraph 50 you will find, as far as I read it (I know we paid considerable attention to this Report, and the Conservators desired to carry out as far as their means would allow them the recommendations of the Commission):—"We also recommend that the small shoal patches in the Yantlet channel, which limit its depth to 25ft., should be removed by dredging. If this be done, a straight waterway 600ft. wide, with a limiting depth of 26ft., would be provided, and the cost of the dredging in question would be so trifling that it might well be defrayed by the Conservancy out of their existing funds." On that 26ft. the scheme was based which I have put before you. That 26ft. might be carried up with the means at the disposal of the Conservators, as far as Gravesend. The 30ft. was altogether out of the question—the Board had no means to do it.

241. They might have applied to Parliament for power?—They might have applied for power, but they also paid a considerable amount of deference to another recommendation of the Commission, which was made in this Report.

242. It is quite clear that the general tenour of the Report seems to be that what was demanded by the shipowners was that the river should be deepened to 30 feet, and in Section 189, which has been quoted several times it was enacted by Parliament that those recommendations should be carried out, and if necessary the Conservators should apply to Parliament for powers to carry them out?—I, at any rate, did not read the report quite in that way. In paragraph 49 it says:—"Having come, with some regret, to the conclusion that works in the river between Thorney Creek and the Nore cannot at present be recommended, we have found it unnecessary to proceed with the second branch of our enquiry, namely, the source from which funds should be provided for works of improvement within that area. We fully recognise, however, that the deepening of the Thames is a matter of great importance, and that the mode in which the necessary funds should be provided demands very careful consideration. It seems to us that the financial powers of the Conservators, whenever the fitting time arrives for undertaking the works, shall be dealt with as a whole; for though we think it is expedient to provide a deep water channel to Gravesend (or even, possibly, to the Albert Docks), it is of equal, and perhaps greater, importance that no financial burden should be so placed as to damage the commercial interests of the Port of London in the present severe competition with other ports in this and foreign countries." That made the Conservators pause very considerably in the matter of going to Parliament. They did not know where they were going to get any funds to carry out such works as these. It is enormously expensive. It says so here in this report.

243. Has nothing been done to carry out Paragraph 35 of the Report?—Something has been done towards carrying it out, but not the whole 30 feet.

244. Six years have elapsed and the river is still not in the state which that Commission recommended it should be put into—it is not dredged to the extent that that Report recommended?—I cannot quite admit with deference, that this Report recommended that we should undertake the 30 feet. It concurred in the view that it would be a desirable thing to have—that is all.

245. It seems as clear as English can make it that the channel shall be deepened up to Gravesend?—The Conservators have carried out a scheme as far as they could

with the means at their disposal, of 26 feet up to Gravesend, which has been accomplished, and now they are carrying out a lesser depth further up the river.

246. Since that, have not the demands of the ship-owners increased rather than diminished?—There are a few very large ships which no doubt feel the want of a 30 ft. channel, but the great bulk of the tonnage does not suffer at all.

247. Is not the tendency at the present day to send merchandise in ships drawing nearly 30 ft. of water?—Yes; there is an increased tendency that way.

248. Then evidently the Conservators have not made the deepening of the river at all correspond with the requirements of the trade—the requirements of the ship-owners—which you must admit should be the first object of the Thames Conservancy Board to do?—The Conservators of course have the duty to do the most they can for the river, but the question has to be considered from its financial aspect also—where the money is to come from, and whether it is really worth this expenditure—whether you are going to tax a large number of vessels which do not want the accommodation for the benefit of those who do want it.

249. Then you take it upon yourself to interpret the Act of Parliament in the way you think it should be interpreted?—Oh, no. The Conservators never wished to do anything that was not in the Act; they did not think themselves called upon to carry out all this work under the recommendations made in this Report; if they had they would have done so.

250. What steps have you taken with regard to the dredging? Have you built the largest sized hoppers which are known to the world?—One recommendation was that the stuff should be no longer shot into a place at Sea Reach. In order to carry out that recommendation the Conservators have built two large 1,000 tons steam hoppers to carry it to the Barrow Deep, where it has been deposited since the hoppers were built.

251. Do you consider those steam dredgers sufficient to carry out economically and effectively the dredging which is required in the Thames according to the recommendations of that Commission?—The steam dredgers and hoppers which we have at present are all we can afford to give with the funds at present at our disposal.

252. You have not exhausted your borrowing powers of £100,000. You might have spent £70,000 in getting a steam dredger of the largest size made?—I think it is not only the steam dredger, but it is keeping the steam dredger and the hoppers at work that you must consider. The £100,000 would not be the slightest use for a work like making a 30 ft. channel up to Gravesend.

253. Of course the same argument that I have mentioned before applies—that you are stopped by finance, not by the Act of Parliament?—That is so—it is finance.

254. The Act of Parliament instructed you to apply for powers to carry out the recommendations of the Commission and that has not been acted upon?—No, certainly there has been no application to Parliament in consequence of that.

255. I suppose you know about the dredgers now used in the Mersey?—Yes.

256. Do you think they would be of any use for the Thames if you could afford to buy them?—Oh, I have no doubt they would.

257. Undoubtedly they would?—I think they would. We have two very good dredgers in the Thames at present.

258. We saw them I think on our visit down the river?—When you went down the river you passed one.

259. Of course these are rather matters for the Board than for the engineer. Have you ever given them any recommendation to carry out any larger scheme than this, and have they been unable to carry it out for want of funds?—No, my instructions were to prepare a scheme which it was possible to carry out with the means at the disposal of the Board, and this is the most, I think, that we can do. We are carrying that out now.

260. Have you anything to say, in your position as engineer to the Conservancy Board, with regard to the present state of things?—No, I have not.

261. You have no recommendation to make?—No, none whatever.

262. You are not instructed by your own Board to make any recommendations?—No, I have not been instructed.

263. *Sir John Wolfe-Barry.*) You have no doubt read pretty carefully the whole of the 1896 Report?—Oh, very carefully.

264. I think you are also aware that that particular Commission was very strictly limited by boundary lines drawn on the map to a distance of about  $5\frac{1}{2}$  miles?—That is so.

265. And they had no statutory power, or power under their Commission to make any recommendations outside those limits?—I suppose not.

266. I think you will also admit that it appears very clearly on the face of the Report that it was in consequence of that limitation of powers that we only expressed our concurrence with the views of the ship-owners as to a navigable channel 30 ft. deep up to Gravesend, and abstained from making what might be called a recommendation under the powers of the Commission?—That is so—I think that is stated in the Report.

267. Therefore, I suppose we may say that no one can doubt that the wish and intention of the Commission was that if the Conservancy Board would undertake the formation of a channel up to Gravesend of 30 ft., then the particular part that was under the purview of the Commission should be deepened to 30 ft.?—I think that would follow.

268. That is quite clear on the face of the Report?—I think so.

269. Then we gave also, did we not, in paragraph 25, a pretty careful table of the obstruction to the navigation caused by the shoals between the points within the limits of the Commission's purview?—Yes, it gives the number of days that vessels would have to wait, and so on.

270. I do not know whether you have had an opportunity of checking these calculations, and whether you can say that they are all correct?—At the time we looked at them I think they were very correct indeed.

271. The obstruction to navigation of ships drawing 26 ft. of water and upwards is undoubtedly considerable?—If they arrive at anything like the period of low water, they have a very considerable time to wait.

272. In the case of vessels drawing 26 ft. of water, the delay varies from a moment to four hours on each tide?—Yes.

273. And those delays would obtain over 310 days out of the year?—Yes, from a moment to four hours during 310 days—that is so.

274. Then with regard to vessels drawing 27 ft. they would be obstructed on 363 days of the year, and the period of delay would vary from a moment to  $4\frac{1}{2}$  hours?—Yes, depending on the time at which they arrived.

275. That is twice a day—at each tide?—Twice in the 24 hours.

276. Then vessels drawing 28 feet might have to wait from a moment to about  $5\frac{1}{2}$  hours?—Yes.

277. I would also like to ask you a question on paragraph 31 of the Report, and on the amended programme which you now give us. You say now that you have been able to obtain a depth of 26 feet of water between the Nore and Gravesend?—That now practically exists. There may be one or two little patches of 25 feet or 25 feet 6 inches, but there is a navigable channel with a minimum width of 1,000 feet, and depth of 26 feet at low water.

278. Have you done any dredging at all on the Leigh Middle Sands?—No.

279. None whatever?—No.

280. Therefore, whatever deepening has taken place, beyond what was found by the Commission in 1894, has been due to natural causes—the natural scour?—Quite so. We have done no dredging there. The recent chart which was undertaken at your desire showed that there was a 26 feet channel about 1,000 feet wide, and the surveys that we have since made show that that channel is maintaining itself.

281. Has that been done since, or was it in existence but not known at the time of our report?—It was in existence, but not known.

282. The disclosure was due to the survey that we recommended?—Quite so.

283. Therefore, so far as regards that particular portion of the Thames referred to in Section 189 of the Act

*Mr. C. More.*

6 Nov. 1900.

Mr. C. J.  
More.

6 Nov. 1900.

of 1894, nothing whatever has been done in the way of dredging or any artificial operations?—Nothing.

284. It is in a state of nature, and nothing has been done at all?—Nothing has been done there at all. I have the charts, which, perhaps, I had better put in.

285. I should like very much to have the charts?—These are copies that I have had made. I have had them made in two forms. One is giving you all the soundings, and the other is marking the 26 feet channel.

(The witness handed in charts.)

286. Now I wanted to ask you with regard to the carrying out of what was obviously the wish of the Commission of 1896 as to a 30 feet channel, whether you have made any estimates—surveys especially, and estimates—of what would be necessary to carry out such an undertaking?—No, we have not. The question has not been gone into as regards a 30 feet channel. It was felt by the Board, that as they had not the funds to carry out the work, and it would be a very expensive matter to go into, it was not necessary to do so.

287. How could the Board come to a conclusion like that if they did not know what the cost would be?—I think your own Report shows that it would be a very expensive matter, because there was not only the question of dredging. They were very much influenced by what is said here that it is a question of retaining walls and other expensive works, which they had not the money to carry out.

288. Nobody has considered the question of what was necessary?—Not in detail.

289. Not in detail or in any form at all, because no estimate has been made?—No estimate has been made because to give a reliable estimate on a question like this would involve a very large expenditure in surveys and so on.

290. The expense of making the estimate even, you say, would be considerable?—Very large indeed—several thousands of pounds.

291. But the Conservancy never thought it desirable to consider it at all?—No, as they had no means of carrying it out.

292. But in the first instance they never studied it at all for the purpose of seeing what it would cost?—No.

293. The question of how the money was to be found was quite another matter, was it not. You do not say that the Conservancy have not got money enough to study a plan and see what it would cost to carry it out?—No; but I say that the Conservators' policy was this, to carry out what they could with the revenue which they had. If they had been going to Parliament, of course it would have been necessary to do all this.

294. But whatever the policy was, we may take it it has never been studied at all?—No, certainly not in the sense in which you put it.

295. And you cannot form any opinion, I suppose, as you have not studied it, as to what it would cost, even in the roundest figures?—No; I should be very sorry to do so. The question of the maintenance of that 30ft. would have to be considered, and what would be necessary to maintain the 30ft., and that would be a very difficult undertaking.

296. That is a matter, of course, upon which people's opinion would differ very much?—I should think the very best engineering talent that could be got should be brought to bear upon a question like that.

297. But at any rate the Thames is able to maintain a channel very much deeper than 30ft. ?—Oh, yes.

298. By natural scour?—By natural scour. In certain parts it would be able to maintain 40ft, and even up to 45ft.

299. Up to Gravesend?—Yes; over the Cliffe Shoals you get very deep water up to Gravesend.

300. If the shoals are removed you find deep water between the shoals and the natural force of the tide to maintain those depths?—In the lower Thames certainly you do, and sometimes in the upper reaches.

301. In the lower Thames the shoals have now been very much removed?—Oh, yes.

302. Do you find any shoalings take place on the properly-dredged portions?—Nothing worth mentioning.

303. Then therefore it is safe to suppose that if you deepen to 30ft. the Thames will itself maintain it?

—Down to the Chapman. Then when you get below the Leigh Middle that is of quite a different character.

304. I think the Commission quite realised that, judging by that paragraph in the Report?—No doubt.

305. Now I will leave the works altogether, and I will ask you as to paragraph 52. That is another recommendation of the Commission as to the sounding and charting of the Thames. Has that been carried out?—Directly the Report was issued, the Conservators appointed an extra surveyor on purpose to carry out this work, and surveys have been regularly carried on.

306. Just to go back for a moment to paragraph 50, the latter part of the paragraph about the removal of the shoal patches. That has been done by nature, has it not, in the Yantlet Channel?—Yes; we have not dredged that.

307. It is buoyed, is it not?—No; the Trinity House have the buoying to do, and they have not buoyed there.

308. Is that channel used?—It is used, as a matter of fact, because vessels know of it, but it has not been buoyed. There has been nothing done since the survey was made.

309. That recommendation has not been carried out?—It was not in the power of the Conservators.

310. Have you asked the Trinity House to do it?—I could not answer that question off-hand, but I can let you know whether any communication has been made to them.

(Chairman.) Can the Solicitor tell us?

(Mr. Hughes.) No, I am afraid not.

(Sir John Wolfe-Barry.) I thought it had been done, and I may say here that the Commissioners attached great importance to having the two channels open, so that they might be available for outgoing and incoming vessels.

(Mr. Hughes.) Might I point out that two representatives of Trinity House attend the meetings of the Board and hear everything that takes place, and are supposed to report to their own authority.

311. (Sir John Wolfe-Barry.) Now to go back to paragraph 52; do you employ a competent marine surveyor to sound and chart the Thames from the Nore upwards, and to record the tidal effects throughout its length?—We employ two. They are constantly at work on these charts.

312. That is, always kept up to date?—Always kept up to date.

313. Then will you look at paragraph 54 as to the establishment of self-registering tide gauges?—We have not had four put up, because of the difficulty in finding places. We have one at Southend and one at Gravesend, which are working continuously—automatic tide gauges.

314. With the exception of this non-execution of any works such as were recommended for a 30 ft. channel, the other recommendations of the Report have been attended to?—We set ourselves to carry them out immediately the Report was issued.

315. (Mr. Ellis.) I want to get from you the precise sums that you spend on dredging. If you have the annual reports before you, will you give me the sum which was spent in the year 1895 on dredging?—I have a summary here.

316. I want the total sums.—In 1895 it was £11,512.

317. Was that all what you call revenue charges?—Yes.

318. Was there anything spent that year on capital account?—Nothing.

319. Then, 1896?—In 1896, £14,294.

320. Anything on capital?—Nothing on capital.

321. Then 1897?—In 1897 £11,151—that was on ordinary expenditure—and on capital £10,969, which made a total of £22,120.

322. In 1898?—In 1898 there was spent on revenue account £16,723, and on capital account there was spent £3,531, and a further sum in the new works of £29,618, or a total of £49,872.

323. In 1899?—In 1899, up to the end of the year, ordinary expenditure £27,822, and out of revenue for dredgers £3,250, making a total of £31,072.

324. (*Sir Robert Giffen.*) That includes some works, does it not, above Staines?—No, this is all below London Bridge.

325. (*Mr. Ellis.*) At the end of your statement of evidence you give us an account of the Conservancy plant. Do you consider that sufficient for your present requirements?—Well, it is as much as we can work with our present revenue.

326. Then it is a question of finance, again?—It all comes round to that.

327. You would like to have more if you had the money?—Undoubtedly.

328. You could do with more?—We could do with more if we had the money to work it.

329. Now I turn to paragraph 25 as to the delays of vessels of certain tonnages. Those figures were correct at the time you say. Has any deepening in the channel, either by nature or art, since then made a difference in those figures?—Well, I have not worked these out lately.

330. It would be rather interesting if you would do that?—It could be done, certainly.

331. You see my point?—I quite see it.

332. But you cannot give me that now?—I cannot off-hand, but I will have it worked out for you. See 1683.

333. I suppose you would admit that even in the Thames a larger proportion every year of merchandise is coming in larger vessels?—Yes, that is so.

334. And therefore the Conservators' programme, arising out of the Committee's Report is year by year becoming less effective. What would be sufficient in 1896, you say, is rapidly becoming antiquated now?—I suppose the proportion of large vessels is becoming greater. The tendency is to make them larger.

335. If the Port of London is to hold its own the necessity for a deeper channel is becoming more urgent every year, is it not?—Yes, it would be, for very large vessels.

336. You have already said that a greater amount of merchandise is coming every year?—Yes, it would be very desirable to have 30 feet of water up the Thames, if you could get it.

337. If you had ample means, as an engineer, you would have no doubt whatever in your own mind as to this 30 feet channel?—I would not go so far as to carry it up to London, but to carry it up to Gravesend or even a little higher.

338. We are anxious to get at your opinion. You have been 30 years with the Thames' Conservancy Board?—I think I may say at once I do not think a 30 feet channel might be taken up to London, but it might be taken up to Gravesend. If you spent sufficient money, I have no doubt you could get a 30 feet channel up to Gravesend.

339. Would you go so far as to say that it is vital to the future of the Port of London that it should have a 30 feet channel?—No, I would not go so far as that.

340. Will you give us a figure as to which we might apply the word "vital"?—It is a question of the amount of delay which those large vessels have to undergo. We have asked the Trinity House to let us know if pilots have complained.

341. Is it a question of complaint in your mind?—If there were really a very serious case we should hear from the people who suffered from the want of it.

342. Do you think the Port of London is suffering by competition of other places where there is a deeper channel?—I can hardly tell you that.

343. You are a man of the very greatest experience, and a most valuable witness from that point of view. May I take it from you that you would desire to see a very much deeper channel if you had the means?—If it could be done, certainly, consistently with not putting too great a burden on the Port of London.

344. It is a question of finance?—Yes, I think it comes to that.

345. (*Sir John Wolfe-Barry.*) May I refer you to paragraph 36 in the Report of 1894, which says: "Above Gravesend there may possibly be some complications affecting the feasibility of any serious deepening of the river by reason of valuable properties in places bordering its banks, and there may be questions as to the stability of the embankments which protect low-lying lands from being overflowed. These matters would require careful examination, but we have not investigated them, as the upper reaches of the river are beyond the limits of our reference." Have you ever investigated that point?—Yes. That is a question, of course, that would arise very seriously. I do not think, until you get a considerable way up the river, there would be much in that, but when you get towards the upper reaches, of course 30 ft. is a very great depth to go to.

346. (*Chairman.*) To what limit higher than Gravesend would you go?—When you come to Woolwich, as a matter of fact, you cannot maintain anything more than about 14 ft. or 15 ft. 15 ft. is about the most you can maintain through that reach.

347. But up to the Albert Dock entrance?—Yes; I think you could get it there without endangering the banks.

348. And without endangering property?—Yes; I think a certain channel might be got.

349. We may take it that you have quite satisfied yourself upon that point?—Yes.

350. (*Rear Admiral Hext.*) In your dredging plant, it appears you have two steam dredgers. When was the first built—the double-ladder one?—I have not got the date of the building of it. It is pretty old.

351. Can you give us the date when the single-ladder one was built?—No; but I can get the information. Both of them have been very considerably altered and improved of late years. I will get for you the date when they were originally built. See 1683.

352. (*Sir Robert Giffen.*) You consider yourself bound, as an engineer, in dealing with the question of improving the accommodation of the river, always to look at the money side of it, and that you cannot go beyond the funds that are available?—Being engineer to the Board, that is all I can do. I can only work with the funds that are at my disposal.

353. You have had no instructions to consider the question from a more general point of view?—No; that is not my province.

354. For instance, you have no instructions to consider it with reference to what is done at other ports with which London is in competition?—No; I cannot say that I have.

355. I merely wish to get at the position in which you stand, because, if that is the case, we know what has been done by the Thames Conservancy. That is the point. You have not gone beyond the question of what can be done with the funds they have at their disposal?—No.

356. And you have not looked at the general question, which must be looked at by some public bodies, as to what the position of the Port of London is to be in competition with other ports?—No, I have not.

357. And you cannot say whether, as is the case of other ports, funds are provided for doing works which are not done in the Thames from other sources than burdening the trade of the port?—No, I have never made any comparison between the sources of income on the Thames and the other ports.

358. You speak almost as if it would follow from the position of additional funds that those funds must come from charges on the trade of the port. That is not necessarily the case, and it may not be the case with other ports with which London is in competition?—Quite so.

359. But you have no information to give from that general view?—No.

360. (*Chairman.*) I suppose you have never been instructed by your Board to make visits to other ports to see what has been done?—No.

361. You have not been instructed to visit either the Olyde, the Mersey, or the Scheldt at Antwerp?—No.

*Mr. C. J. More.*

6 Nov. 1900.

(Adjourned to Thursday next, November 8th, at 12 o'clock.)

# ROYAL COMMISSION ON THE PORT OF LONDON.

## SECOND DAY.

Thursday, 8th November, 1900.

PRESENT :

The Right Hon. The EARL EGERTON OF TATTON (*Chairman*).

Sir ROBERT GIFFEN, K.C.B., LL.D.  
Sir JOHN WOLFE WOLFE-BARRY, K.C.B., LL.D., F.R.S.

Rear-Admiral Sir JOHN HEXT, K.C.I.E.  
JOHN EDWARD ELLIS, Esq., M.P.

CECIL OWEN, Esq., *Secretary*.

Mr. JAMES FLEMING called and examined.

Mr. J.  
Fleming.  
8 Nov. 1900.

(*Chairman*.) I wish just to state that it is very inconvenient for the Commissioners to have a statement of the proposed evidence presented only immediately before the sitting of the Commission. It is impossible for the Commissioners to ask questions properly and intelligently unless they have some time beforehand the evidence which is proposed to be laid before them. I must make a public protest against the unfairness of withholding until the very last moment the evidence which the Board of Customs propose to give. What I say about the inconvenience will apply to other bodies also.

(*Witness*.) May I explain, my Lord, that I was informed that I should not be required to be examined until this day week at the earliest.

(*Chairman*.) That has nothing to do with the matter. The Board of Customs have now been aware, and other public bodies have also been aware, for three months, that the Commission was going to sit about this time. The Secretary has communicated with those bodies, and asked them to furnish the evidence they propose to give to the Commissioners in order that the Commissioners may have full time to consider the evidence proposed to be laid before them. I say it is not fair for a Royal Commission to examine witnesses under circumstances such as these, with documents presented at the very last moment.

(*Witness*.) I am very sorry, my Lord; there was a misapprehension. That is the explanation.

(*Chairman*.) There has been three months notice.

(*Witness*.) Yes, my Lord, but there was a letter sent to us informing us that the Commission desired to have evidence with regard to all kinds of goods, grain, wool, timber, etc.; how they are landed; where they are disposed of; and whether they get to private premises or railway companies. That was a matter which we in the Customs could only laboriously work up by personal inquiries here and there, because it does not appear on official documents, seeing that all these goods mentioned were free of duty. We had no official documents to tell what became of them after we had once cleared them.

(*Chairman*.) My observations are with regard to the warehousing of dutiable goods. That is the paper which I have received this morning.

(*Witness*.) I am very sorry it was not sent before. It would have been sent earlier had I known we were likely to be called so soon.

(*Chairman*.) It had been publicly stated for several months that we were going to meet about this time of the year.

(*Witness*.) I am exceedingly sorry; I take all the blame of the misapprehension.

362. (*Chairman*.) Will you state your office?—My name is James Fleming, and I am Surveyor-General to the Customs Department.

363. The evidence you propose to submit this morning is with regard to the arrangements for the warehousing of dutiable goods?—Yes.

364. Will you proceed to give the evidence, the statement of which has been laid before us?—Shall I read the paragraphs?

365. (*Chairman*.) Yes, you had better read straight on till I tell you to stop?—And shall I comment upon them?

366. Yes, if you have any comments to make?—For the purposes of the Customs Department the goods brought into this country may be divided into three classes:—(1) Free goods; (2) goods in transit to another country; (3) goods liable to duty. The goods in Class 3 are obviously those with which the officers of Customs have most to do, their interference with free and transit goods being limited to the narrowest possible dimensions. Customs duties are chargeable on the following articles:—Chicory, cocoa, coffee, dried fruits, spirits, tea, tobacco, wine, and a few other articles of no great importance, such as beer—that is foreign beer, of course—chloroform, ether, etc. Before going into details, however, it may be advisable to make some remarks bearing generally on the subject of the relations of the Customs Department with the business of the port. A merchant has the option of either paying duty on his goods at the time of landing, or of warehousing them until required for home use or exportation. I may explain that by saying that if goods are warehoused there is a certain percentage upon the duty charged by the Crown in respect of the trouble of taking care of warehoused goods, greater than the amount of duty that would be imposed if the goods were duty paid and cleared immediately upon landing. If they are cleared at once—on what we call prime entry—there is nothing extra chargeable beyond the nominal duty per pound or per gallon, as the case may be; but if they are warehoused, all goods except tobacco pay 5s. per £100 of duty; that is a quarter per cent. That is, in addition to £100 of duty the merchant would have to pay 5s. For the trouble of looking after them in the warehouse, I presume it was imposed. In the case of tobacco the charge is only  $\frac{1}{8}$  per cent., or 2s. 6d. per £100. So that when the duty happens to be very low a merchant will naturally pay on prime entry and clear the goods at once, and he escapes the warehouse charges by doing so. Where the duty is high, or the goods are such as may probably find a market abroad, merchants usually warehouse them under bond, as drawbacks are not allowed by law, except for British manufactured tobacco,

British compounded spirits and liqueurs, beer, and roasted coffee. That means foreign beer and British beer, of course, also. In practice, nearly all dutiable articles are lodged in a bonded warehouse, clarets and other light wines, on which the duty is low, and which are not much required for exportation, being the most important exceptions. On these duty is usually paid on landing, and they are at once delivered out of charge. There is a certain amount even of clarets and other light wines bonded, but there is a very large amount that is duty paid on prime entry, and cleared at once.

367. Is that in casks or bottles?—In casks. There is not much now comes in in bottles since the imposition of the special bottled wine duty. Of course, there is still a remainder of that which was bottled abroad, and which has to be brought into the country and sold, but the bottled import trade shows a tendency to die out, except with regard to sparkling wines. Tea, coffee, cocoa, and dried fruit are allowed to be taken into warehouse, and weighed and tared there, where the work can be better performed without injury to the goods. I can tell you the method of weighing and taring if you care about such details. I do not know whether that would be worth your consideration, but I am prepared to show you the method if you please.

368. It might be put in a note?—Tea is about the largest dutiable article we have to deal with. In a general way tea when brought into the warehouse is weighed at the scales gross. Then either each separate package is turned out, and the tare of the empty package taken, or, as is the case much more generally, a certain proportion of the packages, according to a scale laid down, are emptied. Those are tared, and the tare found by that means is treated as the average tare for the whole of the bed, as we call it, that is the whole of the division of tea of that size. I do not know that I can put it more clearly. Coffee is treated in a very similar way, but there will be special remarks about each article as I come to them. That may suffice to show the method of dealing with them in the warehouse. Tobacco is also weighed in the warehouse of deposit, but tobacco and cigars intended for warehousing at Crutched Friars, or Haydon Square, are weighed gross before removal from the landing place. Tobacco is not always weighed on the spot when it goes into the warehouse, because sometimes it is supposed to arrive in a condition that would make the weight not a proper index to what the weight of the tobacco ought to be, and it is permitted to be kept back for a while before the weighing takes place, at the option of the merchant. Wines, spirits, and tobacco are the goods which are supposed to offer most temptation to the men about the docks and wharves, and as the duties on these articles, especially the duties on spirits and tobacco, are very high, great care has to be taken to guard against pilfering before the Crown's account has been recorded. After that has been done the warehouse keeper is responsible under his bond for the quantity deposited with him. When the long list of wharves, quays, and warehouses in London, with all their concessions and privileges as regards dealing with various kinds of goods, is examined, it will be found that the Customs Department does not stand in the way of commerce more than is necessary. The peculiar disadvantage of the Port of London is that the deep water required by large modern vessels is far away down the river, at a distance from the warehouses and the centres of the markets. I may say that, after the fullest consideration of the whole subject, I have arrived at that conclusion as the real disadvantage that London suffers under compared with every other big port. It is absolutely necessary to have the warehouses up close to the markets where the merchants are, and where such a large demand naturally will require to be supplied, but at the same time you must have the big ships where there is deep water—hence the building of the new docks, at Victoria Docks, Albert Docks, and Tilbury Docks. There are no warehouses at all at Tilbury Docks; nothing but sheds to land the goods into. There are no warehouses at the Royal Albert Docks, and at the Victoria Docks there are only warehouses for tobacco and grain, and a very small trifle of spirits and wine. But this disadvantage is minimised as far as possible by permitting licensed lightermen to convey unexamined goods in every direction along the course of the

river between the lowest dock and the highest approved wharf.

369. What do you mean by "highest approved wharf"?—There is one wharf a long way up approved—at Nine Elms. Goods are lightered down from Nine Elms, and they may be taken up to Nine Elms, but, generally speaking, all the wharves end at about Blackfriars Bridge. There is nothing practically above Blackfriars Bridge except Nine Elms and possibly one or two other places that I do not remember, for special purposes. The lowest dock is, of course, Tilbury, but there are certain approved places even below Tilbury, such as Hole Haven, for explosives and things that it would be dangerous to have up near the upper parts.

370. I was asking you what is an approved wharf? Is every wharf approved?—No.

371. (Sir Robert Giffen.) Is that what is meant by a sufferance wharf?—Yes. Sufferance wharves are of different classes.

372. (Chairman.) Is a sufferance wharf not an approved wharf?—They are approved, but there are different kinds of sufferance wharves: class A, class B, and class C. For instance, take the British and Foreign, a well-known wharf at Lower East Smithfield. All goods can be landed there except tobacco, and tea may be landed for uptown warehouses. The premises are also approved for vatting and bottling. That may be taken as a type of the class A wharf.

373. How many are there of that class?—They occupy all the upper parts between London Bridge and Wapping—on both sides of the river. The bulk of them are from London Bridge to Wapping, but of course there are sufferance wharves where free goods only can be landed. Class A has the privilege of landing dutiable goods and perhaps warehousing them if there is a warehouse on the spot. Class B has the privilege of landing free goods. Class B\* may have the privilege of landing free goods with certain exceptions, and Class C will have the privilege of landing particular kinds of goods. The privileges have been conferred from time to time by the Board of Customs according to the demands of wharfingers and the necessities of their trade. If any man wants to have a wharf approved he has only to show the Board of Customs that there is a reasonable prospect of sufficient business being done at that place to make it worth the while of the Board of Customs to station officers there to examine the goods.

374. Then have you officers permanently attached to each of these approved wharves?—Yes. Certain kinds of officers may survey and examine goods at all these wharves. They are not all of them busy like the British and Foreign.

375. They go backwards and forwards?—Yes. An officer goes to and fro and up and down to perhaps half a dozen wharves. That is especially so with regard to Class B sufferance wharves, which are only for free goods. Free goods are rapidly examined and cleared, and they are not always there. So the man visits about twice a day. In the case of dutiable goods it is very different, and it takes many officers at one wharf, because there you have to take a strict account.

376. (Sir John Wolfe-Barry.) With regard to what you said about deep water, had that reference to the navigable channel or to the water alongside the wharves or to the water in the docks. I wanted rather to follow what was in your mind?—It was in my mind that at the places where the ships lie-to to discharge their cargo the water was not deep enough up river.

377. In the river?—In the docks not deep enough, and probably not in the river, and it perhaps would not be safe for some of these leviathan ships to lie-to in the river. The shipowners of course know their own business in that way, but it is quite obvious that the vessels carrying most of the goods cannot get up as they used to to London Docks and the St. Katharine's Docks.

378. (Chairman.) And of course the depth at low water would necessitate the grounding or partial grounding of large vessels?—Yes, and the water in the docks themselves is not deep enough for the very big vessels.

379. That is to say, the docks comparatively high up the river, like the London Docks and the St. Katharine's Docks?—Yes. Railway trucks and road vans secured by Crown locks are also allowed to be extensively employed for the conveyance of dutiable goods which have not been weighed and brought to account, and of packages

of valuable free goods which the importer wishes to have opened and examined at the warehouse of deposit instead of at the place of landing.

380. But it is not every dock that has railway trucks convenient?—No, they have not all. Tilbury, of course, must do a lot of its work by railway because it is so far away. But still, speaking on that subject of railway trucks and vans, the bulk of the work in London, so far as regards all goods is done by lighters.

381. Will you just mention where your road vans come from?—The road vans come from Lower East Smithfield. They come from the various docks that the Great Eastern Railway has connection with. The road vans also come from the Commercial Road depot, but there are only goods that come from Tilbury Docks there. They can have a connection, but as a matter of practice all goods coming from Tilbury have to come to Commercial Road, and the goods from the other lower docks come up to Lower East Smithfield. That is from the Royal Albert and Victoria Docks, and so on.

382. You were saying that practically the largest amount is done by lighters?—The greater portion undoubtedly of the trade of the Port of London appears to be done by lighters.

383. How do you secure the dutiable goods which are conveyed in lighters?—They are locked-down lighters. The hatches can be locked down and the Crown locks put on them, and, of course, if those Crown locks are found to have been tampered with there is trouble.

384. (Sir Robert Giffen.) Have you many cases of trouble?—Of pilfering, do you mean?

385. Yes?—Yes, that happens very frequently, notwithstanding the locking down, but still there are not many cases in proportion to the mass of goods dealt with. You see, we have a means of detecting it to a great extent, by reason of the reports and entries of the ships. When a captain arrives he has to report his ship. He puts in two copies of the list of his cargo. The merchant also has to enter his goods, and give a specific statement of the marks on the packages and the quantity of goods he expects to receive. Consequently we have every means of knowing from the reports, entries, and lighter-notes whether there has been any shortage when the lighters arrive at the wharf of discharge, because there would be something deficient from the amount that the merchant had entered himself as expecting to receive.

386. And do you make a merchant pay duty on the goods which have been stolen?—The merchant has not to pay duty, but the lighterman is obliged to answer to the Board of Customs for the duty on the quantity short, otherwise he would lose his licence. That is one of the conditions. I may explain something more about the valuable free goods. There are certain kinds of things like Eastern carpets, ostrich feathers, valuable drugs, and many other valuable goods, which, although they ought, according to the Customs' general rule, to be cleared at the ship's side when first put ashore, being free goods and entered as free goods, in deference to the desires of merchants not to have their goods discharged in a dangerous place down on the bankside, where they might be exposed to the weather, or other risks, we permit to be taken up to Crutched Friars or Cutler Street, for instance, and they are opened out where the merchant can send his representative to inspect the goods on their first opening at the same time as the Customs Officer is clearing them. That is well understood to be a concession simply on account of the value of the articles and the danger of injury.

387. So that although they are free goods they are still in your custody after leaving the ship's side for some time?—Yes, until they arrive at the floor of the warehouse where they are to be examined and finally deposited. All kinds of goods free or dutiable may be discharged from an importing vessel between 6 a.m. and 6 p.m. without the shipowner or merchant becoming liable to pay for the attendance of Customs officers. Now I should explain that that was a concession made about eight years ago to the shipowners. There was a complaint made that there were restrictions on the times of landing and clearance in the Port of London, and the Board of Customs and the Treasury decided that all ships going into the Port of London could discharge all kinds of goods between 6 a.m. and 6 p.m. without any charge for overtime on the part of the Customs officers, the Crown bearing the expense. The ordinary legal hours up to that time had been from 8 to 4 from the 1st March to the end of October, and from 7 to 4 from the 1st November to the last day of February.

388. (Chairman.) Does not that prevail now?—No.

389. How is it that when we visited the docks we were told that the work ceased at 4 o'clock?—That was work in the warehouses—taking account of goods—but that did not interfere with the ship. The ship could go on discharging her cargo from 6 in the morning till 6 in the evening.

390. Only from 6 in the morning till 6 in the evening?—If the ship goes beyond 6 in the evening she may get permission to work all night. I come to that later on. But then whoever makes the request has to pay the Customs officers for the night hours. The Crown will only bear the expense of landing goods during 12 hours.

391. This paragraph seems to be different from the other. You go on to state: "Should the goods, however, be dutiable, the Crown does not undertake to bear the expense of bringing them to account, except between the hours of 8 a.m. and 4 p.m. from the 1st March to the 31st October, and 9 a.m. and 4 p.m. from the 1st November to the last day of February"?—But "bringing them into account" has another meaning.

392. That is what I want you to explain?—The ship can discharge her cargo, and if they are free goods the Crown will undertake to examine and deliver them—free them—between 6 a.m. and 6 p.m. If they are dutiable goods the ship may discharge them, but the Crown will not find officers to take them to account except between 8 and 4 for eight months in the year, and between 9 and 4 in the remaining months. All taking to account outside those hours is at the expense of the merchant or shipowner, whoever wants it done.

393. Surely that hardly coincides with what you state here, that "all kinds of goods free or dutiable may be discharged from an importing vessel between 6 a.m. and 6 p.m., without the shipowner or merchant becoming liable to pay for the attendance of Customs officers." What happens between 4 p.m. and 6 a.m.?—If the goods are merely to go ashore into the sheds the shipowner pays nothing—we deal with them.

394. (Sir Robert Giffen.) Do you permit dutiable goods to be put ashore and put into the sheds before you clear them?—Certainly. When I speak of bringing them into account I mean gauging or weighing. They are not gauged or weighed if they were going to be warehoused, but they can be put ashore.

395. (Chairman.) This concession is only to that extent; it is not a complete concession, because a complete concession would be that they would be taken to account between 4 and 6, which they are apparently not. I only want to have it quite clear?—Yes; that is so.

396. Then the concession is not an entire one?—I will give you an explanation of that. The taking into account is a laborious process and requires a great many officers. The merely discharging into the sheds is a thing that does not require many officers, and I am afraid the Treasury would object to paying the amount for doing all this work for twelve hours instead of eight. At present the men have for the most part of the year eight hours attendance, for ordinary officers taking to account of goods—weighing or gauging. That practically means that they are absent from their homes ten hours, because in London they cannot live near their work; they are obliged to live at a distance; and we could not call on the officers to serve more than eight hours a day very well, unless we paid them something for it. The Crown has to bear a great deal of expense to relieve the shipowners. That concession that was made was a very great concession to the shipowners. They were relieved of all expense between 6 and 8 in the morning, and 4 and 6 in the evening, which they had previously paid; but we could not undertake to do the same with all warehouse keepers and merchants, because that would lead to a very serious bill, which I am afraid the House of Commons would object to, if the Treasury did not.

397. Does that interfere with the practical landing of goods to any extent?—No, it does not interfere in the slightest degree. The ships are not detained now a single hour longer than the time that they can throw their goods ashore.

398. I ask that because we are told that rapid despatch is one element of importance in modern trade?—That is so, but if goods are intended to be warehoused it means that they are going to be stored for a considerable time, longer or shorter, and therefore there is not the same urgency to cause the Board of Customs to pay the expenses of officers to weigh them and bring them to account. That can be done in the ordinary way between

See 393;  
9411.

Mr. J.  
Fleming,  
8 Nov. 1900.

the ordinary working hours. When cause can be shown, there is no difficulty in obtaining permission to discharge throughout the night, but in that case the person desiring to do so must pay the Customs officers for their attendance during the overtime hours according to a fixed rate, depending upon the rank of the officer required.

399. (*Sir John Wolfe-Barry.*) Is that privilege often taken advantage of?—There is not a night in the year, except perhaps Sunday night, that there are not ships discharging all night long, down in Tilbury and Albert Docks.

400. Therefore there is a demand for discharging throughout the night?—There is.

401. And that has to be done at the expense of the shipowners?—From 6 p.m. to 6 a.m. at the expense of the shipowner, unquestionably.

402. Could any return be put in showing the amount of money paid for such overtime?—We can obtain a return. I was examining the overtime books myself during the last few days.

403. (*Chairman.*) This is important, because it enters into the charges which the merchant or shipowner has to pay for entering the London docks. Therefore we should like to have a return of all cases where extra charges have to be incurred by the shipowner in consequence of the requirements of the Customs?—By the shipowner for the discharge of goods?

404. For the discharge of dutiable goods, I suppose it is?—Or any goods. I should say there is a slight exception. There are certain kinds of rough goods that can be discharged with the mere casual supervision of what we call the waterguard officers, the officers who prevent smuggling and so on; but these are exceptions. Speaking broadly and generally, if a man discharges his goods between 6 p.m. and 6 a.m., he must bear the expense and not the Crown.

405. Would it be possible to give us in the return the nature of the goods to which those charges apply?—Yes; but generally speaking, the ships are so big, and bring so many goods, that it would be miscellaneous cargo including dutiable goods.

406. (*Sir Robert Giffen.*) I presume that in this matter London is not different from the other ports of the country?—Not in any respect different. That is the universal rule all over the Kingdom—between 6 a.m. and 6 p.m. for landing and loading of goods.

407. (*Chairman.*) Perhaps you will find out for us whether this practice of paying for overtime is equally common in other ports with the port of London; because of course the charges of London have to be compared with those of other ports. It is desirable that the Commission should know whether the other ports usually have to pay the same?—They have exactly the same amount to pay.

408. We want to know whether, as a matter of fact, it is done?—I speak from my own knowledge. They take advantage of it in all ports where they want to discharge their ships. A shipowner in Liverpool is just as ready to require overtime as a man in London, but a great deal of the overtime may be different perhaps, because in London there are far more dutiable goods—more miscellaneous.

409. That is what I thought very likely would be the case. In other ports there would not be so much dutiable goods?—Not so much. London is the market for nearly everything dutiable.

410. But the necessity for discharging quickly may arise with reference to free goods as much as with reference to dutiable goods?—Yes, the rule is universal as to shipping hours—free time and chargeable time.

411. (*Sir John Wolfe-Barry.*) The object of the shipowner being to get his ship away as soon as he can?—Yes. Clearance and delivery of free goods may be obtained at any time when the ship is working, that is to say there is a special examining officer detailed to clear free goods without requiring the attendance of a surveyor or the sanction of a surveyor. If any man has made up what we call a perfect entry for goods, properly describing the goods, the examining officer, between 6 o'clock a.m. and 6 o'clock p.m. may clear there and then on demand—he will examine them, and if they are not dutiable he will write “examined, so-and-so, cleared,” and there is an end of the matter as far as the Customs are concerned. Should the goods, however, be dutiable, the Crown does not undertake to bear the expense of bringing them to account except between the hours of 8 a.m. and 4 p.m. from the

4238.

1st March to the 31st October, and 9 a.m. and 4 p.m. from the 1st November to the last day of February. These are the authorised hours during which bonded warehouses in London may remain open, and weighing, gauging, etc., proceed without charge to the merchant. I use the words “bonded warehouses in London” respecting the hours, because in some ports, by arrangement, the merchants, instead of having 8 to 4, for instance, prefer to have 9 to 5, and there are some other little variations in that respect. But that does not affect the Board of Customs. If the merchants in London and the warehouse keepers made a request that the hours, instead of being 8 to 4, should be 9 to 5, I presume the Board of Customs would offer no objection, because it has been agreed to in Belfast and other places.

412. (*Sir Robert Giffen.*) Is it so in Liverpool?—In Liverpool it is 8 to 4, I think—in fact I am pretty certain—and there are only one or two exceptions; but I may say there has recently been a committee sitting enquiring into the warehouse hours of all the Kingdom, with a view to having a uniformity of principle, if not an absolute exact equality in the hours, that is to say, to have bonded warehouses open for Excise as well as for Customs. We are under the same regulations for warehousing goods as the Excise are, and we have had a Joint Committee sitting who have made certain recommendations to the two Revenue Boards, the Board of Customs and the Board of Inland Revenue, with regard to warehouse hours for the Kingdom. No decision has yet been come to by the Boards or the Treasury on that matter at the present time, but practically 8 to 4 is the almost universal time at present in the Customs. As a matter of fact, many warehouses, especially those containing tea, dried fruit, and coffee, are in their busy seasons kept open much later than 4 o'clock, but in such cases the merchant or warehouse proprietor pays the Customs officers for the extra attendance. Now I should tell you that, with regard to certain trades, 8 to 4 suits them well enough for the great bulk of the year, and with certain warehouses nearly all the year, but in very busy seasons, when there is a rush of goods, there is such a competition amongst warehouse-keepers to get the goods weighed and brought to account in order that they may be put on the market and sold that they will keep open to 6, 7, and 8 o'clock. In the case of dried fruit they have made requests often to remain open till midnight. The Board of Customs require good cause to be shown if a man applies to keep his warehouse open for weighing goods and to keep the officers in attendance as late as midnight. Even in some warehouses, now and then, when they are very busy, they ask to remain open all night for such a matter as the husking of coffee. All that is allowed. I might put it in this way: Trade has new wants springing up every day, and the Board of Customs have to consider whether there is any reasonable necessity shown for the concession asked for, and it is very rarely indeed that a refusal is given if a man is asking anything at all within the bounds of feasibility.

413. I see in one paragraph you say the shipowner or merchant has to pay for the attendance of Customs officers, and in the last paragraph you say the merchant or warehouse proprietor pays the Customs officers for the extra attendance. When does the shipowner cease to pay?—The moment the goods are put ashore he has done with it.

414. Then the extra hours of Customs officers are paid for by the merchant or the importer, not the shipowner?—Well, that may be matter of arrangement. I do not know what arrangement each importer may make with the shipowner, but we generally speak of the shipowner—he is the man who wants to have his goods discharged, and we look upon it that he is responsible or is the person likely to be wanting the place open from 6 p.m. to 6 a.m.—that is the night hours—but it may be the importer that may be so anxious to have some of his goods cleared, especially if they are free goods, and he would then pay on those night hours.

415. Then it may be either one or the other?—Just so. Presumably it is the shipowner, so far as regards the mere putting ashore of the goods. Presumably it is the merchant, so far as regards the clearing of the goods, if he wants delivery. Presumably it is the merchant, indirectly through the warehouse-keeper, if the application is made to keep the warehouse open.

416. (*Sir John Wolfe-Barry.*) By “putting ashore,” I suppose, in the case of ships lightering in the river, you mean putting into lighters?—Yes.

417. That is “putting ashore”?—That is discharging.

Mr. J.  
Fleming.

8 Nov. 1900.

418. Discharging out of the ship?—Discharging out of the ship.

419. (Sir Robert Giffen.) Is the shipowner allowed to put the goods ashore or into the lighter before you have had an entry from the importer relating to the goods?—The captain puts in two copies of his report, that is, or his cargo list, on his arrival. One copy goes to the station where the ship is discharged, and if the captain makes a declaration, that copy may be taken as an "imperfect entry," as it is called, for the goods, which will enable everything to go on except the actual clearance of the goods. It enables all the discharging and so on to go on without any difficulty. If the work to be performed is that of an examining officer, the rate per hour is 2s., or in some instances 2s. 6d.; if that of an assistant, 1s.; if only that of a watcher, 6s. If you would like me to say what kind of work can be done by the different officers I will tell you shortly. The examining officer does all gauging and weighing of dutiable goods, and he also is the person who alone is authorised to clear dutiable goods. The assistant practically does the clerical work for him with regard to all the ship's reports and entries, and identifies the entries with the marks on the same goods on the ship's reports; and we see that all the goods mentioned on the ship's report are accounted for.

420. (Sir Robert Giffen.) I presume that the duties have all been paid before you permit that night work to go on?—You mean overtime?

421. No; the duties themselves have been paid upon the goods?—Well, there are very seldom duties paid on dutiable goods immediately on discharge. That is only in the case of prime entry. The duties would have to be paid on the prime entry before you permitted the delivery. The assistant does the clerical work as an assistant to the examining officer, and helps him in a variety of ways. The watcher tallies the cases ashore, or draws samples and acts as messenger, acts as locker—locking up the warehouses and opening the doors, and so on, and a number of little things of that kind. He accompanies dutiable goods, also, on lighters when the lighterman has not got a locked-down craft, or if for any reason it is inconvenient to have the packages stowed in a locked-down craft: a lighterman would often apply in such a case for a watcher to accompany the goods instead of carrying out the regulation of locking them up. That is continually being allowed in London. Permission to keep the bonded warehouses open beyond the regular hours upon these terms is a concession to the wants of particular trades of far greater value to them than the cost incurred. I think that will be pretty obvious to you. If a man has got a lot of goods for a merchant, and the merchant is very anxious to put them on the market and sell them, the question of a few shillings of Customs overtime is a mere trifle in the matter. The real expense, of course, is the overtime rates of pay that the warehouse keeper has got to give to his own staff, who are, of course, numerous, handling the goods. The Customs people taking to account are comparatively few in number. I come now to say a few words about the facilities granted by the Board in various ways. Many proofs indeed could be given of the readiness of the Board of Customs to grant special facilities when *bonâ fide* required by the representatives of any trade, whether old or new; but perhaps a few instances will suffice to show the spirit in which the authorities approach such questions. Indian and Ceylon teas have been very extensively grown of late years, and the importations into London, which has practically a monopoly of the tea trade, have enormously increased. In many cases these teas are unsuitable for use by themselves, but by judiciously blending and mixing them with other teas, almost any taste can be gratified or any market supplied at a suitable price. The Indian and Ceylon teas being the produce of British colonies, it is of the highest importance that facilities should be given for mixing and preparing them for foreign and colonial markets. It has been found that a large trade can be done by putting the mixed teas in small tins or packets ready for delivery to the consumer, and for exportation. This must be done in a bonded warehouse or floor under special regulations designed to safeguard the Revenue. It has not hitherto been considered by the authorities advisable to authorise to any great extent the mixing and blending of teas in a bonded warehouse. Unless the teas are of the same mark, or unless they are very small parcels that would not be readily marketable in such small lots, it is not the practice in a bonded warehouse to allow a general mixing *ad libitum*; there must be a good cause shown for such a concession in

general, because, of course, all these operations require watching and looking after, and it tends to greater expense on the part of the Customs Department, and that is why it is discouraged generally. Not many years ago there were only three or four warehouses in London in which tea could be packed in this way for exportation. There are now twenty approved by the Board for this purpose, and most of them are doing a good business, and employing many hands. That is a branch of business that has sprung up under my own eyes within this last fifteen years or so, and undoubtedly there are now many hundreds employed in the packing of tea in that manner. Quite possibly we should have lost our export trade in tea had that not been allowed.

422. Is that to the Continent that you are speaking of?—Partly to the Continent, but to a very great extent Colonial, to such places as South America, the United States, Canada, and all our Colonies, as well as the Continent. Indian and Ceylon teas, I should point out, have almost altogether displaced China teas within this last fifteen years. The China trade is a bagatelle now, compared with the Indian and Ceylon trade. Our exports of coffee are two or three times greater than our home consumption, and nearly all of it goes out from London. The Board have sanctioned the erection of machinery in several bonded warehouses to enable the proprietors to have the coffee husked, cleaned, polished, and otherwise prepared for the export trade, which has largely increased, apparently in consequence. It has increased much more than 50 per cent. in this last three or four years, and I can only attribute it to the greater facilities we have given.

423. Does that go equally to our Colonies and to the Continent?—No, that goes to the Continent mainly. Coffee comes from all quarters to London, but it goes out from London mainly to the Continent. A few years ago the coffee merchants made a great complaint that they had not got the same facilities that their competitors had on the Continent, and that they were in danger of losing their export trade, which, in coffee, is a very large matter. They came to the Board of Customs and applied for various facilities, which the Board granted, down even to putting husking machinery actually inside the bonded warehouses, and the result has been exceedingly satisfactory as regards the coffee export trade.

424. (Sir Robert Giffen.) You say, "The Board have sanctioned the erection of machinery in several bonded warehouses"; how many are there?—There are about four that have got those husking mills, I think.

425. Are there any of them in the docks of the Joint Committee?—There is one, I think, in the London Dock. There is one at the Red Lion; there is one down at the Metropolitan and New Crane Wharf, and one at Hay's Wharf; if I am not mistaken there is one now in the London Dock, but it has not been there a long time. Facilities have been given for utilizing tea for producing caffeine, and tobacco for manufacturing nicotine, sheep-wash, horticultural powders, etc. In all such cases the article used escapes payment of duty, of course with Parliamentary or Treasury sanction. I can tell you an interesting matter about those two things. These are comparatively new industries. Some years ago every bonded warehouse had got a big "damaged" hole, which contained a great deal of damaged tea, tea that salt water had got into, the sweepings of the warehouse that were not clean enough for sale, and so on; and, that "damaged" hole being of course under Crown lock, warehouse keepers were put to the expense of having the damaged tea taken away and either burnt in a furnace or else emptied into the sea. Some man discovered that he might make use of this damaged tea, and extract theine or caffeine from it. He came to the warehouse keepers and offered to empty their "damaged" holes. They were very glad to get them emptied, because it had hitherto cost them a great deal of money to have the damaged tea destroyed. By and by, when the demand came frequently, more than one person applied to do it. I know there are at least two who now do a good business in this. The warehouse keepers then began to say we ought to have a price for it. As a matter of fact they do now get a price. The better the quality is for manufacturing caffeine the better price they get. I believe, but Messrs. Whiffen of Battersea, and Howard of Stratford, do very well. At all events they go on doing it, and the presumption is that it pays

them very well. Then in the case of using snuff and tobacco; when a manufacturer of tobacco pays duty on the unmanufactured leaf and takes it out for the purpose of manufacturing, he will of course produce a great deal of waste in his warehouse—bits of stalk and dust, and so on, that fall away from the tobacco, and he wants to get his drawback on that. He had already paid the Crown duty upon it, and the Crown agrees to pay him not merely the duty that he paid, but to give him one penny per pound extra on account of the expense of going through a process of grinding it into snuff, so that a proper sample may be taken to separate the dirt and the moisture, and so on, and to arrive at a proper standard for allowing the drawback. First of all they exported this stuff to such countries as still continued the formerly general practice of snuff taking, and then they found by and by that the demand for snuff had died out. Then they began to go through a sort of sham exportation of it; they really destroyed it without putting it ashore. You must understand that the Customs had guarded themselves very carefully that these people did not get the snuff out of the control of the Customs after they had paid drawback upon it. Then it came to this, that the manufacturers requested the Board of Customs to allow them simply to deposit this refuse snuff—what they call offal snuff—in the hands of the Board of Customs, and let the Board of Customs do what they liked with it. A few years ago the cellars of the Custom House were filled with this deposited snuff, and we had to charter steamers every now and then to take the snuff down and empty it into the waters of the Nore to poison the fish. But some man discovered that he could make use of this stuff in manufacturing nicotine and sheepwash and horticultural powders for sprinkling plants and conservatories, and so on. Then they offered to take it away. One man (I know who it was) offered to take it away from the Board of Customs for nothing. Of course the Board of Customs, provided they were safe-guarded that it did not go into consumption as snuff or tobacco, had no objection. They were saved the expense of destroying and the nuisance of having it about the place. At first it was taken away by this one man, but rivals began to bid for taking it away, and a price is now given for it. When the Board of Customs get any considerable quantity of it they have no difficulty in getting the stuff taken away, and really they are paid a price for it, but there is some question about who is entitled to that price—whether the men who deposited it are entitled to it or the Board of Customs; I do not know how the law stands in the matter with regard to that point. I mention those things to show the course adopted. If any man hits upon any idea that is likely to create wealth of any sort, he does not find the Board of Customs stand in his way at all beyond what is necessary to protect their own revenue. In such matters the question of profitable working might very much depend upon the reasonableness of the official regulations. Some particulars may now be given regarding the different kinds of dutiable goods imported into London, and the manner in which they are handled on arrival. Tea is our most important article; for practically all the tea brought into the kingdom is landed in London. The tea ships mostly discharge in Tilbury, Royal Albert, Victoria, or West India Docks. The packages are not weighed there, but landed on the quay or into a shed, and subsequently passed on to some of the wharves or warehouses on the riverside accessible by lighter, or placed in railway trucks for removal to a depôt, from which they are distributed to the warehouses for which the importer has entered them. Some are taken direct from the nearer docks by cart, and some are first lightered to a wharf and carted thence. In the case of Commercial Road warehouse, occupied by the Docks Joint Committee, the railway vans (that is the railway vans that come from Tilbury) can be unloaded directly into the warehouse. I do not think there is another station where a railway van can actually discharge its goods into the warehouse floor. The greater part of the tea removed by lighters from the docks goes direct to waterside wharves having the privilege of warehousing this article, and most of the remainder goes to wharves from which it is collected by vans sent from uptown warehouses. Some of the uptown warehouses are, however, largely supplied through the railway depôts at Commercial Road and Smithfield, near London Docks, to which depôts the packages are sent by railway trucks under Crown locks. Those would be the goods brought mainly from the Royal Albert and Victoria Dock at Smithfield. The method of distribution is more fully set out in con-

4238.

nection with the list of bonded tea warehouses given below. Though the greater part of the tea brought into the docks is delivered into lighters, the proportion delivered into railway trucks at Tilbury Docks is relatively greater than at any of the other docks, because of the distance from town. There is a great deal lightered up from Tilbury; but when there is a great distance to go, they apparently find it convenient to a great extent—especially when taking goods from Commercial Road—to take them by the railway. Of course that depends on the relative cost. The wharves usually receiving tea by lighters from the docks and delivering it to vans for uptown warehouses are as follows:—

Wharf.	Vans Collect For
British and Foreign Wharf	Priory Warehouse. St. Olave's Warehouse. Trinity Warehouse.
Brewer's Quay	Cooper's Row Warehouse. Metropolitan Warehouse and a little for other warehouses.
Gun Wharf	Cooper's Row Warehouse.
Hay's Wharf	Monastery Warehouse.

Then I will give a list of warehouses where tea is deposited in bond and brought to account. The method of receiving is stated opposite the name of the warehouse, but every warehouse receives goods in any way that may happen at the moment to be most convenient.

Name of Warehouse.	How the Tea is usually received from Import Ships.
Abbey Wharf	By Lighter.
Brook's Wharf	"
Butler's Wharf	"
Chamberlain's Wharf	"
Colonial Wharf and Buchanan's Warehouse	"
Commercial Road Warehouse	By Rail from Tilbury to Depôt adjoining, or By Rail from other Docks to Depôt, Smithfield, thence by Van.
Cooper's Row Warehouse	By Lighter to Brewer's Quay or Gun Wharf, thence by Van.
Cutler Street Warehouse	By Rail from Tilbury to Depôt at Commercial Road, thence by Van, and By Rail from other Docks to Depôt at Smithfield, thence by Van.
Hay's Wharf	By Lighter.
London and Continental Wharf	By Rail from Tilbury to Depôt, Commercial Road, thence by Van, and By Road Van from other Docks, also By Lighter to Brewer's Quay, thence by Van.
Metropolitan Warehouse	By Lighter to Hay's Wharf, thence by Van.
Monastery Warehouse	By Lighter.
Monument Warehouse	"
Nicholson's Wharf	"
Oliver's Wharf	"
Priory Warehouse	By Rail from Tilbury to Depôt, Commercial Road, thence by Van, and By Road Van from other Docks, or By Lighter to British and Foreign Wharf or Brewer's Quay, thence by Van.
Red Lion Wharf	By Lighter.
Smith's Wharf	"
St. Katharine's Docks	"
St. Olave's Warehouse	By Lighter to British and Foreign Wharf, thence by Van.
Trinity Warehouse	By Lighter to British and Foreign Wharf, thence by Van, also By Road Van from the Royal Albert, Victoria, and West India Docks.

426. (Sir Robert Giffen.) A great part of the tea is, as a matter of fact, put into lighters?—A very great part of the tea is put into lighters and either discharged straight into the warehouse, if the warehouse is on the river side, or discharged at a wharf that has the privilege of letting tea or dutiable goods generally be landed there, and then it is put into a cart, locked up, and the lock is opened when it reaches the uptown warehouse.

427. Could you tell us roughly what proportion of tea comes to the Tilbury Dock?—About two-fifths I should guess; I have not made a calculation.

428. And from the nature of the accommodation at Tilbury Dock it must go away from that dock elsewhere to be warehoused?—Yes, it must. Tilbury has absolutely no warehouses, neither has the Royal Albert Dock any warehouses.

429. (Chairman.) Only sheds?—Only sheds. Lest anybody should say that I am incorrect in that I may take

c 2

Mr. J.  
Fleming.  
8 Nov. 1900.

Mr. J.  
Fleming.  
8 Nov. 1900.

one slight exception. The P. & O. Company have got a store warehouse for dutiable stores—a small warehouse where their stores are kept, but that is only for use on their own ships. With that exception there are no warehouses at the Royal Albert Dock any more than there are at Tilbury. Blending and repacking of tea for exportation has been sanctioned at seven of the above-named warehouses. There are also 13 private warehouses approved for the same purpose which receive their supplies by cart from warehouses where the landing account has been taken. Those 13 are not entitled to do anything else; they are not entitled to warehouse goods in general nor in fact to repack any goods except tea with one or two trivial exceptions where they can mix a trifle of coffee with chicory and so on. Chicory is usually landed at Brewer's Quay, Bull Wharf, Colonial Wharf, Fenning's Wharf, Fresh Wharf, Hay's Wharf, Mark Brown's Wharf, St. John's Wharf, St. Katharine's Wharf. The majority of these wharves receive chicory by lighter from importing ships lying in the river or (to a limited extent) at the docks.

430. (*Sir Robert Giffen.*) Can you give any reason why the ships importing chicory in particular should be ships lying in the river and not in the dock?—They are mostly continental.

431. And they are small ships?—Small ships. The big ships are the ocean-going ships. Chicory does not come from India or Australia; it comes from France and Belgium and Germany and those places. Ships discharge direct into warehouses at St. Katharine's Wharf (where a large stock of chicory is landed), Colonial Wharf, and Mark Brown's Wharf. A portion is cleared at once from the wharf by payment of duty, being removed by land carriage. Then chocolate and confectionery containing chocolate, and also confectionery containing spirit, are usually imported at Tilbury Docks, Royal Albert and Victoria Docks, British and Foreign Wharf, St. Katharine's Wharf, Chamberlain's Wharf, and in the river. They are mostly cleared at once from the place of landing, either for exportation or upon payment of duty for home consumption. Then as to raw coffee and raw cocoa, there is a very large trade, of course, in these articles. Import ships discharge in the Royal Albert, Victoria, and Tilbury Docks, the London and St. Katharine's Docks, the West India Docks, in the river, and at most of the wharves receiving cargo from the Continent. Coffee and cocoa are also brought from Newhaven and Southampton by rail to depôts at Deptford and Nine Elms, and thence by lighter to London Docks and to various wharves. When not discharged direct from ship into warehouse, coffee and cocoa are almost invariably forwarded by lighter to the wharf or dock where they are to be warehoused.

432. When the coffee comes from Newhaven and Southampton by rail, is the duty considered to be received and paid at the Port of London?—Yes, it is simply passed on and they will probably be doing several operations upon it before it is brought to account for duty.

433. Then would these cargoes appear in the records of Newhaven and Southampton as imports, or would they appear for the first time in the imports of the Port of London?—I think, unless they had been taken account of at Southampton or Newhaven, what we call the short copy slip, which is the summary of the entry, would be made out in London, and the entry would be deemed to be an entry in London in our statistics. I believe so.

434. So they would be imports to the Port of London, although they had come to London by rail?—Yes, but London passes on some goods in the same way under a certain paragraph in our code. If the goods are entered for some outport they are allowed to pass in transit through London and be brought to account at the other port.

435. Not a large amount, I suppose?—No, it is a comparatively small thing in either case. It is necessary, however, to correct what I said just now as to Port statistics. Although goods passing in transit from one port to another are charged against the warehouse in which the account is taken, the quantity imported is under an order issued last year to be in future statistically credited to the actual port of arrival. Generally speaking, we take account of the goods at the place where they are put ashore.

Then with regard to dried fruit, consisting of currants, raisins, figs, dried apricots, French plums and prunes; the import ships discharge into warehouses at the following docks and wharves: Bellamy's Wharf, Botolph Wharf,

Fresh Wharf, Middleton's Wharf, London Docks, Millwall Dock. In those cases ships are able to discharge straight into the warehouse. The cranes can crane the goods straight into the warehouse, which of course is a great advantage. Some dried fruit is cleared at once from ship's side by payment of duty, and immediately delivered to vans. A great portion of the cargoes is also sent by lighter to other wharves:—To British and Foreign Wharf, Cotton's Wharf, Fenning's Wharf, Red Lion Wharf, South Eastern Wharf.

Now as to Spirits, the import ships discharge mostly in the docks. In the river German spirit only comes, but all the other spirits are, generally speaking, discharged in the Docks, under the Docks Joint Committee. Import ships discharge at:—

London Docks	- - -	Mostly Brandy.
St. Katharine's Docks	- "	German spirit and liqueurs.
East and West India Docks	- "	Rum.
Millwall Docks	- - -	German spirit and liqueurs.
Royal Albert and Victoria Docks	- - -	Rum.
Tilbury Docks	- - -	Rum.
In the River (into lighters)	- "	German spirit.

Also at most of the wharves below bridge receiving goods from the Continent, and possessing the privilege of landing spirits. When not discharged from the ship into warehouse, spirits are almost invariably conveyed by lighter to the dock or wharf where they are to be warehoused, or where the landing account is to be taken for an uptown warehouse. The undermentioned uptown warehouses receive their supplies by vans from wharves, as indicated opposite the name of each. The landing account in each case is taken at the wharf, on the landing of the goods from the ship alongside, or from the lighter bringing them from the ship.

Uptown Warehouse.	Landing Wharf.
Cooper's Row Vaults - - -	Brewer's Quay.
Lime Street Vaults - - -	British and Foreign Wharf.
George Street Vaults - - -	" " "
Metropolitan Vaults - - -	" " "
Tower Hill Vaults - - -	Brewer's Quay.
Trinity Vaults - - -	British and Foreign Wharf.
Water Lane Vaults - - -	Brewer's Quay.

It is a rule in our Department that all wet goods must have the account taken where they are first put ashore. The casks are not quite full. It would not be safe to fill a cask with spirits, because if the weather got very warm or the cask was stowed in a hot part of the hold, the cask would burst or the bung would be blown out, and therefore casks are not generally full when they arrive in London. If we allowed them to be carted away without very great care, without any account being taken, we should not know how much the deficiency was when the cask was first imported, and therefore the rule is that wet goods shall be gauged at the point of actually putting ashore. That does not apply, of course, to dry goods, as I have explained before.

436. (*Sir Robert Giffen.*) That is explaining the movement of spirits while under your care?—Yes. They have either to be gauged at the dock when they are put ashore, or they have to be gauged at some wharf which has the right of receiving spirits. Then, after gauging, of course they can be carried up, because the warehouse keeper is responsible.

437. Can you give us any idea what proportion of the spirits coming to London is as a matter of fact put into lighters?—It would depend upon what kind of spirits you are thinking of. The brandy will nearly all be discharged in the London Docks, and therefore will not need to be lightered elsewhere, because London Docks is the greatest place for storing brandy, but there is a certain amount of brandy coming in that is discharged in the London Docks from the import vessel into lighters, lightered round to Brewer's Quay, and then taken to

some of the uptown warehouses. Tower Hill Vaults is the most notable one.

438. And other spirits?—Rum will practically all go into the West India Docks, and practically all of it is warehoused there. When I say practically all, I mean the great mass that we recognise. Of course, every man may have rum in his warehouse if he is entitled to warehouse spirits at all, but speaking broadly and generally, the West India Dock is the place for rum. Then with regard to German spirits, they of course come by the steamers coming from the Continent, and wherever a wharf has ships discharging at it which come from the Continent—Hamburg or some of these places—it will probably have the German spirit there itself, warehoused at its own place, but it may be gauged there and carted elsewhere, according to the choice of the merchant who imported the stuff as to where he wants his goods stowed. He may possibly want it, for the convenience of drawing samples, somewhere near himself, or the warehouse keepers near him may give him privileges in the way of reduction of charge or something of that sort, which will make it worth his while to choose one warehouse in preference to another.

439. The effect of that is that the greater portion of spirits arriving is not lightered, although a certain portion is?—That would be so—not lightered outside the dock, but I am not prepared to say that they would not be lightered inside the dock to go from one side of the dock to another, or from one dock to another adjacent, under the same Joint Committee, of course.

440. That is a different question?—Yes, that would depend upon where the ship was berthed. Now I will deal with tobacco and cigars. Import ships discharge at Tilbury Docks, Royal Albert Docks, Victoria Docks, West India Docks, London Docks, and in the river into lighter. Nearly all tobacco of various kinds, manufactured and unmanufactured, received into London, is sent to three great warehouses, viz.:—Victoria Docks, (mainly "leaf" or unmanufactured tobacco); Crutched Friars Warehouse (mainly cigars and other kinds of manufactured tobacco); and Haydon Square Warehouse, under Excise supervision (mainly cigars). That warehouse is not under the Board of Customs, but under the Board of Inland Revenue. It is a warehouse that belongs to the London and North Western Railway Company. They bring a great deal of goods from Liverpool and Manchester, and they warehouse the goods at Haydon Square. Leaf tobacco is generally imported in heavy packages, and is usually removed from the place of importation by lighter to the Victoria Docks for warehousing there. Crutched Friars Warehouse is supplied by vans, which collect cigars, etc., from Railway Depôt at Smithfield (goods from Royal Albert, Victoria and West India Docks); Railway Depôt at Commercial Road (goods from Tilbury Docks); various Railway Depôts (goods from Liverpool); Nine Elms Railway Depôt (goods from Southampton); Brewer's Quay (from the Continent); and from other approved places at which tobacco and cigars, etc., may be landed. Most of the stock of tobacco at Haydon Square is received by rail from Liverpool. I should say that Liverpool is the great import place for American tobacco, which, of course, is the tobacco in the unmanufactured leaf. There is far more comes into Liverpool necessarily by reason of its great connection with America, but there is a great deal of it which, after coming into Liverpool, comes to London. London gets all the kinds of tobacco other than American, and a considerable quantity of American.

441. (Sir Robert Giffen.) Would the tobacco received at Haydon Square be credited as an import to London?—No, to Liverpool. For two reasons. In the first place it would be more or less dealt with and taken into account at Liverpool, and in the second place it is under the Excise, and the Excise have no ports to credit any importation to.

Then with regard to wine; wine is imported in ships discharging at all the docks excepting Surrey Commercial Dock, which is mainly for timber and other like goods; in the river (into lighters); and at most of the approved wharves, such as British and Foreign Wharf, Brewer's Quay, Chamberlain's Wharf, Hay's Wharf, Fresh and

Botolph's wharves and St. Katharine's Wharf. The various kinds of wine are mainly imported at the places named below:—

	Ships mostly discharged at
Port . . . . .	London Docks.
Sherry . . . . .	" "
Madeira . . . . .	" "
Claret and Burgundy . . . . .	British and Foreign Wharf.
Californian Wine . . . . .	Royal Albert, Victoria and Tilbury Docks.
Australian Wine . . . . .	Royal Albert, Victoria, Tilbury and London Docks.
Tarragona . . . . .	Millwall Dock and Fresh Wharf.
Champagne . . . . .	Chamberlain's Wharf.
German Hocks and Moselles . . . . .	River, St. Katharine's Wharf, and St. Katharine's Dock.

Then there are a few uptown warehouses and vaults which receive supplies by van from the wharves which I specify opposite the name of each:—

	Place of Landing and Examination.
Cooper's Row . . . . .	Brewer's Quay
George Street Vaults . . . . .	British and Foreign Wharf
Metropolitan Vaults . . . . .	British and Foreign Wharf
	London Docks.
	Brewer's Quay
	Fresh Wharf.
	Millwall Docks
Tower Hill Vaults . . . . .	Brewer's Quay.
Trinity Vaults . . . . .	British and Foreign Wharf.
Water Lane Vaults . . . . .	Brewer's Quay

That deals with all the articles of very much consequence. There are a large number of small things, such as collodion and ether, but the duty on them is only for the purpose of protecting the duty on other articles like spirits. It has been found that some people do not mind taking ether for getting drunk upon, and therefore it is necessary, for the purpose of protecting the spirit revenue, that there should be a duty upon it.

442. Is that all your evidence with regard to that part of the subject?—That is all my evidence with regard to dutiable goods unless you wish any explanation.

443. Are you going to speak with regard to the general opinions of the Board of Customs with reference to this Royal Commission, as to any suggestions you may have to make, or are you only speaking with regard to what you have dealt with already? Is anybody from the Board of Customs going to speak as to any suggestions with regard to the Port of London as a whole?—I have not any authority to say that anything will be said from the Board of Customs except this, that the Chairman told me he would be present, and certainly, on the matter that you have for the present put aside, namely, that of warehouses of special security, and so on, the Chairman will be prepared to appear before you. Perhaps he is here to-day.

444. We do not want to be led into any side issues while the main question is still *sub judice*, but we should like, at some time or other, to have the opinion of the Board of Customs with regard to general questions affecting the Port of London, especially with regard to what you mentioned in the earlier part of your evidence as to the disadvantages of the port. If you are not prepared, perhaps you will submit that to the Chairman. Will you intimate to the Chairman that we should like to have the opinion of the Board of Customs with regard to the larger portion of the subject?—The disadvantages that the port suffers under

445. Yes. That raises the whole question really which is before the Royal Commission as to the desirability of making any changes in the present system of bringing the goods up to London?—Yes.

Mr. J. Fleming.

8 Nov. 1900

See 670.

Mr. J.  
Fleming.  
8 Nov. 1900.

446. Then your evidence is concluded?—Yes, unless you desire to ask me anything further. May I be permitted to mention one thing where there may be a wrong impression given? I said that at Victoria Docks there was nothing warehoused except tobacco and grain, and a

little spirits and wine; but, as a matter of fact, they have a large frozen meat place down at Victoria Docks. I do not want the dock people to think that I was neglecting anything.

See 368

Mr. CHARLES ALSTON KENT called and examined.

Mr. C. A. Kent. 447. (Chairman.) You are Secretary to the Trinity House?—Yes.

448. Will you state the powers and duties of the Trinity House relative to the Port of London?—The duties are confined to two specialities, broadly speaking. The Trinity House is the pilotage authority for the London district, consisting of the waters of the Thames and Medway as high as London Bridge and Rochester Bridge respectively, and also the sea and channels leading thereto or therefrom, as far as Orfordness to the North and Dungeness to the South.

449. Are those the limits of the Port of London legally, or according to the Customs?—Those are the limits of the London district for pilotage purposes, but for the port the limit is fixed at the boundary stone just below Gravesend.

450. Are they the same as for the Customs?—No.

451. We have to deal with the Port of London, and we should like just to know where you overlap, or where you go beyond, the Port of London?—I believe there are several limits for the Port of London, but this is the one fixed by the Merchant Shipping Act for pilotage purposes.

452. You have to do all the buoying?—Yes; the Trinity House is also the general lighthouse authority, and, as such, lights buoys and marks the river and approaches, and removes such wrecks as are dangerous to navigation or to boats engaged upon lifeboat service. Those are really the only two functions of Trinity House.

453. As I understand, the Thames Conservancy have made constant surveys of the river in the last few years. Are you furnished with copies of those surveys in order that you may buoy new channels, and so on?—Yes; I think the Conservancy generally send in copies of surveys to the Trinity House; and of course the Trinity House have all the new charts which are prepared by the Hydrographic Department of the Admiralty. Two members of the Board of the Trinity House—two Elder Brethren—are representative members on the Thames Conservancy Board. Then there is one other function which they perform indirectly; two of the Elder Brethren in turn assist the Judges of the Admiralty Court in deciding marine causes—collision cases, etc.

454. Have you the sole right of giving licences to vessels to take up gravel from the bed of the river?—No longer. Those rights ceased by the terms of the Thames Conservancy Act, 1864.

455. I suppose you are familiar with the Report of the Board of Trade Committee of 1894, of which Sir John Wolfe-Barry was Chairman?—Yes, that is the Lower Thames Navigation Committee.

456. Have you carried out any of the recommendations of that Committee?—I think there was only one which really applied to the Trinity House, and that was not carried out, as the Elder Brethren, after consulting with their navigating officers and pilots, did not agree in opinion with that Committee. After going very fully into the matter, they did not agree.

457. (Mr. Ellis.) Will you just refer us to that recommendation?—I am speaking of the paragraph which refers to the marking of the Yantlet Channel.

458. (Rear-Admiral Hext.) In the Report of the Lower Thames Navigation Committee, they recommended that the Conservancy should appoint competent surveyors of the river. That is in paragraph 52. Then in paragraph 50 they recommended that the Yantlet Channel should be at once buoyed, and so made available for navigation. They also recommended that the small shoal patches in the Yantlet Channel, which limited its depth to 25ft., should be removed by dredging, and then they believed that the Yantlet Channel would be likely to remain a useful route for large ships for some years to come?—Yes.

459. You say that the buoyage of these channels rests with the Trinity House?—Yes.

460. Did the Conservancy report to the Trinity House

that the Yantlet Channel had been dredged and made available for shipping, and if so, why did not the Trinity House place buoys as recommended by the Committee?—They considered the matter very fully with their officers and pilots, and they came to the conclusion that gas buoys, if placed in the proposed positions, would be an obstruction to vessels under 23 feet draught, and would lie in what would be the fairway of most ships; they would be very liable to be fouled and damaged, and a slight blow is sufficient to extinguish the light. The Board were also of opinion that even if a 27 feet channel did exist at the Leigh Middle and was marked for day and night navigation, it would be of little or no use until a channel was made right up to Gravesend of sufficient width throughout for deep draught vessels to manoeuvre towards others in accordance with the rule of the road at sea without leaving the deep channel; until this was done it would be better for ships to anchor at the Nore, where the risk of collision is far less than between the Leigh Middle and Gravesend. Further, the Board did not consider that the southern channel was to be preferred for vessels of deep draught to the one close to the southward of the river middle buoys, and that a small amount of dredging to the southward of the west river middle buoy would straighten the latter from end to end, and much improve it for navigation purposes.

461. Then practically the new channel was not marked at all?—No, not as suggested, but as before.

462. (Sir Robert Giffen.) Was any action taken by the Trinity House in conveying that opinion to public authorities who might have to deal with the matter, making it public?—Yes; I think the decision was conveyed to the Board of Trade.

463. But you cannot say for certain?—No. I cannot say at the moment for certain, but I am pretty sure that the decision was communicated.

464. (Chairman.) Do I understand that what you have stated before the Commission as the reasons for not doing what was recommended in the Report of the Board of Trade Committee was communicated to the Conservancy Board at once?—I cannot say at the moment whether it was immediately and officially communicated, but the matter was so fully considered, and there was so much consideration given to it that I feel sure that the decision must have been made known. [The witness subsequently informed the Commission that "the decision as to the Yantlet Channel buoys was not officially communicated to any public department or body, as the report of the Lower Thames Navigation Commission was never sent to this Board officially, but Sir George Nares, who was a member of that Commission, and also at that time professional member of the Board of Trade, was informed, as well as the members of our own Board who were on the Thames Conservancy Board."]

465. Perhaps you will kindly ascertain what the date of that communication was between the Trinity House and the Conservancy Board?—Yes.

466. (Rear-Admiral Hext.) Do the surveyors of the Conservancy report practically at once to the Trinity House any alterations in the channel?—No; they do not report directly, but as a matter of courtesy the Thames Conservancy I think send copies of all new surveys to the Trinity House.

467. But how can Trinity House, unless they are afforded that evidence, carry out the buoyage of the river?—There is not very much buoyage to be done in the river, and the Trinity House take care by sounding that the buoys are in the best positions. There are very few navigation buoys, and they have been transferred backwards and forwards from the Trinity House to the Conservators in former years. When the Thames Conservancy Act, 1864, was passed, the buoys which had previously been laid down by the Trinity House in the jurisdiction of the Conservators were transferred to the Conservators. Then in the year 1878, when the other Thames Conservancy Act was passed, those buoys were transferred back again to the Trinity House, so that practically the Trinity House is the buoyage authority.

468. If you are not acquainted immediately any alteration takes place in any channel by the Conservancy, who are responsible for the survey of the river, how can you be responsible for the proper buoyage?—Practically they always do communicate the surveys.

469. But you say only as a matter of courtesy?—Well, they always have sent it, and there is a communication of course always between the Trinity House and the Conservators, as there are two members of the Trinity House on the Conservancy Board.

470. (Chairman.) The Trinity House, I understand, examine and certify persons who are qualifying as dock-masters?—Yes.

471. What sort of examination do they undergo?—The examination is to see that they are competent nautical men and accustomed to the handling of ships.

472. The Trinity House certify for the dock-masters that are employed by the Thames Conservancy, or for the harbour masters?—For the docks.

473. Either for the docks or for the river generally under the Thames Conservancy Act?—Yes.

474. It is a *bonâ fide* examination, is it?—Yes.

475. Do you reject any persons who are not qualified?—Yes. They attend the same committee as that which examines the pilots, and they are tested.

476. Then the pilotage of the river is under Trinity House?—Yes, the pilotage also.

477. We have had a communication from the London Direct Short Sea Traders' Association calling our attention to the anomalies connected with the compulsory pilotage of the Thames. Have you anything to say about that?—The compulsory pilotage of the Thames is established by law, and the Trinity House are not in a position to alter the law.

478. No, but are you aware of any of the anomalies that they complain of?—I do not know to what points they are referring.

479. Nor does the Commission at present. I only give you an opportunity of mentioning the fact?—I do not remember at the moment what their points are.

480. Perhaps you will pay attention to any points that may be raised in future by any body who wishes to come before this Commission?—Yes.

481. (Rear-Admiral Hext.) Seeing that the Trinity House have been interested and concerned in the state of the navigable channels of the Thames, and also seeing that they can afford no money for expenditure on Conservancy works, have they ever made any representations to the Conservancy in the way of recommendations for dredging channels?—No. They have looked upon it that a certain line divides them from the Conservancy. Their jurisdiction is on one side of the line, and that of the Conservancy on the other side. They have made representations as to the necessity for dredging within their own jurisdiction.

482. But not otherwise?—No, although they have sent and do send suggestions of pilots to the Conservancy to consider.

483. (Mr. Ellis.) To whom were those representations made?—They were made to the Board of Trade.

484. Have the Trinity House received any complaints from any person or public authority with respect to lighting and buoying?—Generally, do you mean?

485. Yes, as regards the Thames. I am speaking of the Port of London?—No, there is no special complaint of any kind.

486. Nothing has ever reached your body?—No; well, there is an Advisory Committee of Shipowners who now have a voice in all matters of new lighthouse works, and special alterations, and that sort of thing, and they have recently made some suggestions, but I do not think any of them come into the London district or the River Thames.

487. I am asking now specifically with regard to the Thames. Then we may take it that, during your time at all events, coming before us as the secretary of the Trinity House, you say that no complaint has reached the Trinity House with respect to the lighting and buoying of the Port of London?—No, I think not—nothing that I can call to mind at the moment.

488. But you do not think—you know?—I think I should remember anything of the kind if there were anything serious at all.

489. Your jurisdiction extends to other ports than that of London, of course?—Yes, in lighthouse matters it extends to the whole of England and Wales, the Channel Islands, and Gibraltar.

490. And in buoying also?—Yes, as a lighthouse authority, but in the matter of pilotage it only goes beyond London in respect of about thirty-seven outport districts.

491. Do you consider London is at any disadvantage as compared with any other port in respect of lighting or buoying, or any other matter falling under your jurisdiction?—No, I do not think so at all. I think that, as between the Trinity House and shipowners, matters both as regards lighting and pilotage are on a very satisfactory footing at the present time. In the matter of pilotage the shipowners are represented on the Trinity House Pilotage Committee. Both the shipowners and the pilots have been represented since 1896; and in the matter of lighthouses there is this advisory committee to the Board of Trade, on which shipowners, merchants, underwriters, and Lloyds are all represented. I think the state of things, if I may be excused for saying so, is particularly satisfactory, because a year or so ago the light dues were reduced, and from the beginning of last year the pilotage rates were also reduced.

492. Then we may take from you, speaking with great experience, that the Port of London has nothing to complain of in comparison with any other port as regards the exercise of the functions and jurisdiction of the Trinity House?—I certainly think so. Besides, further improvements are constantly being made.

493. I suppose Trinity House has never taken part in expressing any opinion with regard to the deepening of the river. Has anything ever been entered in your minutes as an approval of the recommendations of Sir John Wolfe-Barry's Commission with regard to the deepening of the river?—These representations have been made to the Board of Trade. Their attention was called to the gradual silting up of the Swin Channel, and it was represented that the West Swin would have to be closed, and they also represented the desirability of deepening by dredging the Leigh Middle Shoal. It was on making those representations that the Board of Trade replied that even if they could agree with those proposals for dredging they could not legally sanction any expenditure from the General Lighthouse Fund for that purpose. They could not sanction lighthouse expenditure for Conservancy works, they said.

494. (Sir Robert Giffen.) And there is no fund for carrying out such operations?—There is no fund, and it is very doubtful whether there is any authority for dredging channels which are not within the limits of a local authority or the Thames Conservancy.

495. (Chairman.) Do you think that the Thames suffers from the divided authority which is brought before us, the control of the navigation of the river being shared between Trinity House and the Thames Conservancy; or do you think that is an ideal state of things?—The disadvantage is in this way, that, as the Trinity House have pointed out, it is no use doing certain things below a certain line if they are not also done above that line at the same time.

496. And, therefore, the Thames suffers from divided jurisdiction?—The Thames suffers in that respect.

497. From divided jurisdiction or insufficiency of powers?—Yes, rather from the lack of authority or power to deal with such a matter as dredging.

498. As a whole?—Yes. It was thought that the Board of Trade might have some powers inasmuch as by a certain Act they had had transferred to them powers which were formerly vested in the Lord High Admiral of the Seas, which subsequently devolved upon the Board of Admiralty. It was thought that if any Department or any authority had any power it might be the Board of Trade under this Act of 1862 transferring these Admiralty powers to them.

499. But the Board of Trade have always answered that they have no power of financing any scheme. I suppose that is the answer?—That is the answer.

500. (Rear-Admiral Hext.) Then it practically amounts to this, that beyond the limits of the powers of the Conservancy, they have actually no money to dredge and no power to dredge.—That is so.

Mr.  
C. A. Kent.  
8 Nov. 1900.

Mr. CHARLES JAMES CATER SCOTT called and examined.

Mr. C.  
J. C. Scott.  
8 Nov. 1900.

501. (Chairman.) You are Chairman of the London and India Docks Joint Committee?—Yes.

502. We have all of us had the statement of your proposed evidence. It seems to us that the historical statement contained in Appendices 1 and 2 may very fairly be put in as documentary evidence, as there can be no question with regard to a statement of facts; I do not suppose anybody will question that?—That was our intention, if you agreed to it.

*(The witness handed in an historical statement as to the causes which led to the institution of Docks in the Port of London. See Appendix, 2nd day, No. 1. Also a statement as to Dock and Warehouse legislation and construction from 1799 down to the time of the Report of the Parliamentary Committee on Foreign Trade, 1823. See Appendix 2nd day, No. 2.)*

503. Perhaps you had better begin with the matter contained in Appendix 3?—May I just preface my evidence by saying that we have drawn out this statement of evidence with the idea that we should as clearly as possible give you the history of the docks, and of the Port, from the very earliest times, and so far as the first four appendices are concerned they are entirely historical, and I really do not think there is much necessity for me to go through them, if you would allow me to put them in. I think that would save your time and ours. I will formally hand in Appendices 3 and 4.

*(The witness handed in a Statement as to the Report, made in 1823 by the Parliamentary Committee on Foreign Trade, and Observations on that Report. See Appendix, 2nd day, No. 3. Also a statement as to legislation directly and indirectly affecting the docks and warehouses now controlled by the London and India Docks Joint Committee since 1823, and as to the works constructed during that period. See Appendix, 2nd day, No. 4.)*

504. (Sir Robert Giffen.) Can you give us a copy of the different Acts of Parliament constituting the docks of the Joint Committee?—Of the different Acts of Parliament constituting all the docks?

505. Yes; I should like to see them, because we refer to a great many Acts of Parliament which it is very difficult for us to get access to. I do not know how far my fellow Commissioners sympathise with me, but I think most legal gentlemen would be of opinion that there is very little use referring to documents which are not to be submitted to those gentlemen who have to decide upon them afterwards, and I feel the necessity very much of seeing the Acts of Parliament themselves?—Mr. Turner, our solicitor, asks me whether you require to refer to all the Acts, including those that have been repealed, or only to those which are in force now.

(Mr. Ellis.) You will have a regular library if you have all the Acts that have been repealed.

506. (Sir Robert Giffen.) I may say that I have seen most of the Acts, and I think it would be interesting to see some of the Acts which have been repealed, as well as those now in force. It is very difficult indeed to follow your historical statement without having the Acts of Parliament to which you refer?—Some of these Acts are out of print; but we are perfectly willing to give you a complete set of them all if you would wish to study them.

507. (Chairman.) We only want them for reference; we do not wish to keep them. We only want them in order that we may be able to refer to them?—We will see that that is done.

508. I should suppose you would have a copy in chronological order of all the different Acts referring to your business?—We have.

509. (Sir Robert Giffen.) If you could make a reprint of them it would be very convenient to us?—What you desire is, to have such information as we have for ourselves?

510. Yes?—We will see that that is given to you. Then, my Lord, I should propose this. I have a statement of our Statutory powers. I propose to hand that in, and perhaps that may also go into the appendix.

511. (Mr. Ellis.) There is no argument in that we may take it?—None whatever. It is simply a statement of the powers that we have under our different Acts.

512. We cannot allow anything to be put in that is argumentative without having an opportunity of asking questions upon it, but if this is simply historical reci-

tative it can be put in?—You may take it from me that there is nothing argumentative in it.

*(The Witness handed in Statement as to the Statutory powers of the London and India Dock Joint Committee as regards levying rates on Vessels and goods respectively. See Appendix, 2nd day, No. 5.)*

513. (Sir Robert Giffen.) That will not prevent us from asking questions upon it afterwards?—Certainly not.

514. (Chairman.) Then we come to the statement as to the capital raised and expended, the expenditure of income on capital works and on maintenance, and the interest and dividends respectively paid by the London and St. Katharine Docks Company and the East and West India Dock Company. You can hand that statement in, but we want it explained to us.

*(The witness handed in statement. See Appendix, 2nd day, No. 6.)*

We accept it as a document, but we want you to give some information upon it personally?—Certainly. There are twelve tables in this statement, and I think the first thing is Table 1. That is the London and St. Katharine Docks Company. On one side we show the capital authorised. I do not know whether you would wish me to run through all these figures. These are all authorised under our different Acts of Parliament. There is first of all our Capital Stock, which is £5,756,697 5s. 10d. of Ordinary. Then we have Debenture Stock amounting to £3,412,766, and Preference Stock £1,620,000.

515. (Mr. Ellis.) May we take it that the word "authorised" includes the word "created"?—Certainly. Then we have a certain amount of Debentures amounting to £226,875. These debentures, as they fall in, we are gradually replacing by the issue of Debenture Stock, the intention being that this is gradually all to disappear and to be represented by Debenture Stock. We have in hand a balance, being unissued Debentures, of £96,513 3s. 8d., representing Debentures which have been paid off for which we have not issued Debenture Stock, either because the market was not favourable for the moment for the issue of Debenture Stock, or we have employed a certain amount of our reserve fund in providing for that money.

516. Then are we to take it that the £10,789,463 is minus the £96,513 3s. 8d.?—No, that includes it.

517. But nothing has been issued for the £96,513 3s. 8d.?—It represents Debentures that have been issued, but which have been paid off, and are in hand of course.

518. Then you have cash in hand?—Yes, cash in hand, as it were. The object of this table is to show the amount we have expended on the one side on our different properties, and to show how that amount is represented on the other side by the Capital authorised.

519. (Chairman.) Has any of the land been sold since this statement was drawn up?—No, nothing since. On the other side we have, first of all, the capital cost of the London and Katharine's Dock, which I may say was the parent company of the existing London and St. Katharine's Dock Company. That was formed by the amalgamation in 1864 of the St. Katharine's Dock Company with the London Dock Company. At the same time, the Victoria Docks and Estate was merged into that London and St. Katharine's Docks Company with a capital cost of £1,062,480. Then, afterwards, there has been expenditure on the Victoria Docks for sheds and buildings of £49,199 10s. 8d.; additional buildings and improvements, £296,229 13s. 6d. Then the Victoria Docks Extension, commonly called the Royal Albert Dock, is £2,092,366 10s. 2d. Mudding land at Crossness is the one-half share or the two-thirds share of the land which originally belonged to the East and West India Dock Company. At the time of the formation of the Joint Committee in 1889, we took our share of this land, which up to that time was used for depositing the mud dredged from the different docks; we do not use it now, we are simply holding it for what it may be worth in the future.

520. It is valuable land?—We hope it will be some day. I cannot say that I put a very great value on it to-day. Then land at West Ham, £2,035 2s. 0d. That makes the total cost of all our undertaking £10,919,408 5s. 1d., which you will observe is larger than our total capital authorised. To supply the

See 535 to 542.

difference, we have realised property to the extent of £62,211 4s. 1d., and we have received, as premium on issuing Debenture Stock, £67,733 15s. 2d. That does not represent the total amount of the premium on our issue of Debenture Stock, because what we receive now comes to our reserve fund, with which I will deal presently, all of which has been invested in the property. Our old 4 per cent. Debenture Stock stood at a very considerable premium. It is not as high now as it was some three or four years ago, and anybody who knows anything about finance will quite understand that everything has gone down, but it stands to-day at about 124, I think, and we have put out this 4 per cent. Debenture Stock as high as 137.

521. (*Sir Robert Giffen.*) The greater part of this capital expenditure is for the London and St. Katharine's Dock, and not for the Victoria Dock, nor for the Victoria Dock Extension?—Quite so. The London and St. Katharine's Docks were close up to the City, the St. Katharine's Dock particularly so. The land originally was very expensive to buy. Then they are surrounded by very massive walls, which were erected in accordance with the requirements of the Government; and, in addition to that, we have very large warehouses which were also erected many years ago when there was a great number of dutiable articles, for which it was necessary to have those warehouses.

522. I was not putting the question in order to criticise the expenditure, but merely to have it brought out where the money had been spent?—Just so.

523. (*Mr. Ellis.*) The only deduction from the £10,919,000 is from realised property and premiums in order to bring it to the same figure?—Certainly.

524. That is the only object of that?—That is the sole object of it. Otherwise, if we did not show that, it would appear that we had spent more on our property than we had power to realise.

525. Then the £10,799,463 is simply the sum that has been expended; it does not carry with it the idea of value?—Oh no, I would not say that. That is the simple sum that has been expended. To-day, I do not say anything on the question of value unless you wish me to. This is simply a copy really of our account, where we show that we have received so much money and expended so much money.

See 5580. 526. (*Sir Robert Giffen.*) Can you supplement this by a statement of the market value of all these stocks at their different prices?—I have not got that for you to-day, but I can very easily let you have it.

(*Mr. Ellis.*) I thought you were going to take value afterwards.

527. (*Chairman.*) If you take the value of property, you must also take the value of the docks *quâ* land. It might be useful that we should know that in the course of the proceedings, but we do not want to go into that question now, particularly?—What I understand is, that you would wish at some future time that I should be able to put forward some idea of the value of our present undertaking.

(*Chairman.*) Just so, that is the important thing, I think.

528. (*Mr. Ellis.*) You raise it, as I understand, in your case—inferentially at any rate?—Inferentially we do.

529. Therefore, if you raise it, you must give us the information?—Very well.

530. (*Chairman.*) Then will you go on to Table 2?—Table 2 shows the amount charged to revenue for maintenance for the years from 1864 to 1868. That is the amount charged for maintenance of the London and St. Katharine's Docks Company's premises prior to the establishment of the Joint Committee, which came into force on the 1st January, 1869. After that the accounts for maintenance were of course for both companies.

531. You say in Table 2 that the amounts include renewals?—Yes.

532. But Table 3 is an account merely of new works?—Yes.

533. So that besides renewals you have absolutely new works?—Yes. I should explain that by new works we mean this:—In that account, the table showing the amount charged to new works, we have put what we really believe may be fairly called capital expenditure; only in the old days we had a system by which we charged a certain amount of new works, spreading them over a number of years.

4238.

534. Those are the days when you had money in hand. You spent some of your revenue in works?—We spent some of our revenue in works. That, however, does not represent the total amount. That is only the amount which we are actually able to-day to abstract from the accounts. You will see that of 1865 there is no mention; of 1869 there is no mention, because in those years we were not able to extract the amounts for certain. We preferred only to put in the figures that we were absolutely confident were spent upon new works. Then Table 4: "Amount received from the East London Railway Company as compensation for the right of passing railway under the dock; expended by the Company wholly, or very nearly so, in respect of new works; as extracted from the half-yearly accounts." This is an addition to our capital expenditure—a further amount of £155,000 in those years from 1874 to 1886. Table 5 gives the same information for the India Company as Table 1 gave for the London and St. Katharine's Docks Company, but I must make this correction when I say that. It is not on the same lines, because, unfortunately, the India Company had trouble some few years ago. They had carried through a scheme with their creditors, and under that they had to fund a certain amount of interest, and you will find that on the debit side there is funded interest on creditors' statement capitalised under amended statement arranged, £177,465. Then there are further amounts, making a total of £1,181,394, less discount on preference stock, £18,167, making a total amount arranged for under that statement, £1,163,227 8s. 9d; so that when you come to the cost of the property I do not think it is quite fair to say that for that amount of their capital there exists in this balance sheet an absolute asset. I say that at the moment, but I want presently to draw your attention to another point, which I think more than corrects that.

535. (*Mr. Ellis.*) I see in this table you have two columns: "amount authorised" and "existing issue." There you have separated what I referred to before "authorised" and "created." Is not that so?—Yes.

See 515.

536. The amount created is not the same as the amount authorised. Am I correct in that?—In the account of the London Company, the capital authorised and the capital created we have treated as the same. We have unexhausted borrowing powers, which were scheduled in our Act of last Session on the occasion of the amalgamation, but they are not brought into this at all.

537. I wanted to clearly understand whether "authorised" included "created"?—Then I was wrong in saying that. We have, in addition to the capital authorised here, certain borrowing powers which are not tabulated here.

538. You see it is very important?—Yes, I quite see your point.

539. (*Chairman.*) Does that apply to both companies?—No, not to both companies. You have noticed the difference here. In the case of the India Company the amount authorised is stated, and the amount created. In the case of the London Company it is not so. We have not treated it in that way. Really this "capital authorised" here should be "capital created." I think that would be the fairer way to state it. It is authorised and created. In addition to that there is a certain amount of capital authorised, but not created.

540. That is what I wanted to get at?—It is in the schedule here. Would you like me to put in a table showing what capital we have authorised, but not issued?

541. (*Chairman.*) Yes, I think that will be very valuable?—We will do that.

See 5580.

542. (*Mr. Ellis.*) Briefly, what I mean is this. As you raise the financial case, you must let us have all the financial figures?—I will try to give you that.

543. (*Sir Robert Giffen.*) It would be impossible, would it not, to say exactly from Table 5 how much has been spent on the Tilbury Docks and how much has been spent on the West India Dock, the East India Dock and the South Dock; owing to the deductions for sales of land we cannot tell from this account how much has been spent on each?—Oh, yes; it is stated here in the first part.

544. But you go on to make a deduction from the aggregate sum on account of sales of land of about £616,000, and we do not know to which dock it is applicable. Perhaps you would know, but it does not appear from this account?—You mean there are certain deductions made for premiums and sales of land. The West India Dock should have such and such, and Tilbury such and such amounts.

545. Yes. I mean we cannot distribute that item?—

D

Mr. C.  
J. C. Scott.  
8 Nov 1900.

Mr. C.  
J. C. Scott.

8 Nov. 1900.

(Mr. Ellis.) What Sir Robert Giffen wants is the allocation of the £616,000. We want to allocate that to the particular docks.

(Sir Robert Giffen.) Just so.

545a. (Chairman.) What are these sales of land; are they sales of surplus land in connection with a particular dock?—No. I think I can answer that question. Formerly the India Company had certain uptown warehouses at Fenchurch Street and Billiter Street. They realised those, sold them, and the money which they got I believe went into the construction of the Tilbury Dock, so that there would be no deductions from these amounts for the cost. The money that was realised by the sale of those properties was employed in the building of the new dock.

546. (Sir Robert Giffen.) That would have the effect, would it not, of diminishing the capital cost of the East and West India Docks? As between the different docks, the West India Dock and the East India Dock would stand at a smaller sum in your books on account of these sales of land. The whole effect of these sales of land should be allocated to these docks, although the money was used to build the Tilbury Dock?—No, I do not think that is quite so.

547. I wish to know how it stands?—There are two assets of the India Company that have disappeared. By their sale they have received so much for them. That money was used for building the Tilbury Dock. That money is represented in the accounts by this £616,068.

548. (Chairman.) What Sir Robert Giffen means is that the first two items here relating to the East and West India Docks should be diminished by the sales of land, because those lands were appurtenances to, and formed part of, the docks. That is Sir Robert Giffen's point.

(Sir Robert Giffen.) That is my inference from the figures, with Mr. Scott's explanation added, but I should like to know how the Joint Committee view the matter, because it is for them to explain.

(Mr. Ellis.) The question really is, against what docks the £616,000 is to be credited?

(Witness.) I do not think it could be credited against any dock, because it was separated altogether. It is a little difficult for us to bring this out as you want it, because, as I shall point out to you presently, the Fenchurch Street warehouse was bought out of Revenue; it never went into capital account at all. In the prosperous days of the India Company that was bought out of Revenue. Then, when it was sold it was dealt with in this way: they used that money as a means of paying for the cost of the Tilbury Dock. It is not included in either the West India Dock Company or the East India Dock Company, or the South Dock Company. Those are all represented by their separate Capital accounts, and there was something outside that altogether in the shape of property bought out of income.

549. Of which income?—The surplus income of the old East India Company, going back to the first third of the century.

550. (Mr. Ellis.) But surely you would have had to spend more on the docks if you had not had that £616,000?—Undoubtedly; you would have had to raise more money if you had not had that, and the cost of your docks would have stood higher, undoubtedly.

551. That is the point?—You are quite right about that.

552. The Tilbury Docks would have cost three million odd pounds?—No; more capital would have had to be raised.

553. (Sir Robert Giffen.) But where would it have been spent if it had been raised. This gross figure would have remain what it is?—That first figure, £616,068, would have remained exactly what it is.

554. But you cannot say exactly from which of the five items composing the £6,000,000, the £708,000 should be deducted?—Yes, practically I think I can say. It is from the Tilbury. That money went into the Tilbury Dock. That £708,000 came from the town warehouses which were sold.

555. It belonged to the East and West India Dock Company?—Yes; that is the explanation—practically all. The capital really at which those docks now stand is £5,489,000, because the £6,198,000 is written down by that amount of £708,000.

556. But as between the different docks, I was suggesting that the accounts would appear to show that if

you were separating the different docks from each other, the deduction would be made from the East and West India Dock Company, and not from the Tilbury Dock?—Only a small portion. The major part of the deduction would be made from the Tilbury Docks, I think, because it was at the time of their trouble when the Tilbury Dock was being built that these premises were sold for money. The premises were not sold so as to provide for any of the cost to the East India Dock Company or the West India Dock Company; they were sold to provide part of the cost of the Tilbury Dock.

557. Still, if you had not built the Tilbury Dock, and you had sold the premises, the shareholders of the East and West India Dock Company would have had the money divided amongst them?—Yes, it would have gone in diminution of the capital account, undoubtedly.

558. (Mr. Ellis.) If you had not spent the money, you would have had it?—I will not dispute that for a moment.

559. (Chairman.) Now will you go on to Table 6?—Table 6 again shows, as in the case of the London Company, the amounts charged to revenue for maintenance over a series of years.

560. (Sir Robert Giffen.) Does that include Renewals of any kind corresponding to the other account?—No, that is Maintenance pure and simple, not Renewals. Then we come to Table 7. That is a statement of the items of expenditure on new works charged to Revenue Account, and of amounts used in the diminution of cost of works. If you will take the first items of the West India Company, from 1804 to 1822, there was charged for maintenance and new works £862,000. Allow for revenue account, say, £6,000 a year, and you have a balance of £748,000 charged to revenue for cost of new works. From 1823 to 1826 the amount charged to revenue account for new works was £80,000. Then from 1827 to 1830 the note is "New works were provided out of new capital, or by sales of lands." From 1831 to 1838 new works charged to revenue account were £23,000, and then the Fenchurch Street warehouse, bought in 1836 and cost charged to revenue, sold for £335,000—that is a portion of that £600,000, to which I was referring just now.

561. (Sir Robert Giffen.) How much was charged to revenue?—The Secretary tells me £80,000. So that on the West India Company alone they had £1,186,000 of revenue or the proceeds of revenue, which has gone into capital expenditure receipts, and I think it is fair to put that as against that £1,163,000 of capitalised interest. So that, practically, on that alone the account balances. There was value in property for that amount of capital. Then, in addition to that, the East India Dock Company spent—I do not know that I need specify the amounts—the Company spent four sums totalling £203,000. That was all charged for revenue from new works—amounts that might very properly, if they had thought fit, have been charged to capital. Then the East and West India Dock Company, after they had amalgamated, charged a further amount of £325,000. Now, I should like to draw your attention to the summary. The West India Dock Company during its existence charged to revenue £1,186,000; the East India Dock Company charged to revenue £203,000; the East and West India Dock Company charged £325,000, and then there was a profit on sales of other lands applied to works of £40,000. So that in addition to the capital amount raised for the construction of their works, they put in no less a sum than £1,754,000.

562. (Sir Robert Giffen.) Against which there is that item of rather more than £1,000,000 for interest which has been capitalised?—Yes.

563. (Mr. Ellis.) Down to what date was the £1,754,000?—Down to when the Joint Committee came on the scene.

564. Then it went on till the two streams met?—Yes.

565. Perhaps this is anticipating—if so, you will not answer it now. Can you give us at any time in your evidence the dividends that were paid?—Yes; I have them here.

566. The last three paragraphs of Table 7 depend on what the values are?—Yes. To a certain extent, of course, it is speculative. I simply mention it, but I should not like to make too much of it. It is certainly very material that the land on which the East and West India Docks stand originally cost £60,000, and are now valued by Messrs. Edwin Fox and Bousfield

at £1,930,000. That is the unearned increment in 100 years.

567. When you say "now," you mean at the present time?—At the present time. This is got up practically for the purposes of this Commission.

568. (*Chairman.*) Then let us go to Table 8?—That is a statement of the total capital expenditure on the company's undertaking, showing that a much larger amount than the authorised capital has been spent on the undertaking in capital works. If you turn to Table 5 you will see that, including that amount of capitalised interest, the capital was £6,914,363. And the total expenditure as set out in Table 8 was £6,664,410.

569. (*Mr. Ellis.*) Not much more than the capital authorised?—No; but it is so much more than the capital issued.

570. But you have "capital authorised"?—Yes. What I really want to show is that for the money put into the property of the company there should be value, because there has been spent so very much more than the actual amount raised for that purpose, and if there is cause to allow for a depreciation, still the property should be worth the capital amount.

571. You say it is "so very much more," but it is £700,000?—Well, it is 10 per cent.

572. There has been a shrinkage in values. However, I will not enter upon that?—Table 9 shows the capital expenditure of the Joint Committee from the 1st January, 1899, to the 31st December last year. This you must not treat as in addition to the figures I have just given you for the India Company, because you will see that there is an advance by the India Company of £305,000 at the bottom of Table 8, which is of course money lent to the company for the purposes of carrying out these works.

573. (*Chairman.*) These are merely giving in detail what has been already put before us in your table?—Half of it, because some of that has been provided by the India Company. The arrangement with the Joint Committee was that each company should provide one-half of any capital expenditure. The East and West India Docks Company, in their accounts, show their half. The London Company do not show their half.

574. (*Sir Robert Giffen.*) What would you say is the aggregate capital account of the two companies, putting it together?—In round numbers about £18,000,000.

575. (*Mr. Ellis.*) Just to get the right figure on the notes, as I understand (you will correct me if I am wrong), the net capital expenditure of the Joint Committee, when they deduct the £305,000 from it, is a sum of £321,925; am I right?—Quite right; but may I say that I think the better way to put it is that the Joint Committee have expended £627,000; of that amount of £627,000 expended by the Joint Committee at the bottom of Table 8 you will find £305,000.

576. Then we will put it in this way. The East and West India Dock Company have contributed £305,335, and the others have contributed £321,925, is that so?—The explanation is that each company had provided the same amount, but on the 31st December, 1899, the Joint Committee had not applied to the India Company for the balance of their half, so that there was an amount due from the East and West India Company to the Joint Committee which was not paid.

577. (*Sir Robert Giffen.*) Before leaving that point; you said that the capital account stands at about £18,000,000?—Yes.

578. But that would not include the sums spent out of revenue, which were really on capital account, but were not charged to capital account?—No, certainly not.

579. That is about £600,000 more?—Approximately you are right. I think I must go back from what I said just now. We show that the India Company have out of revenue spent 1½ millions in new works. Against that there is a certain sum of about £1,100,000 for interest. That leaves, as you say, a debt of about £600,000. But in addition to that the London Company have spent certain sums. On Table 4, there is £155,000. But if you go back to Table 3, there is another £117,000. Then in addition to that, not shown in this statement here, there is all our reserve fund, about £330,000, which has all gone. Our reserve fund has been invested in our works. So that really your £600,000 would be plus nearly another £600,000. In reality the amounts invested in the works under the control of the

Joint Committee represent about £1,200,000 in excess of the capital of the two companies.

580. That was what I wished to make appear, as you do not add up the sums in this account?—It is just £1,200,000. Now I go to Table 10. Table 10 really shows the maintenance of the Joint Committee, dock by dock and department by department, since we came into existence on the 1st January, 1889. You will notice in the middle of the account the rectification of the account to the end of 1895. That rectification came about in this way. When the Joint Committee was established, the two companies thought it good policy to continue their old practice of charging to revenue every year a certain amount of new works. After we had carried this out for six years it was brought to our attention that we as the Joint Committee had simply control over the working, and we had no power of spending any revenue on capital account, and we had to refund those amounts which had gone in new works—we had to return them to both companies. That involved a rectification of the accounts at the end of 1895, and a rectification of these figures as applied to new works.

581. (*Mr. Ellis.*) Was that rectification in consequence of any legal decision?—It was not through the action of anybody outside the Joint Committee.

582. You took advice, perhaps?—We took advice. Somebody on the Joint Committee raised the point; we then took the best opinion we could get, and we were very sorry, but the opinion we got was very, very strong indeed that we had to account to each company for its share of the money earned—that we had no control over the capital expenditure.

583. That was the reason for the total deduction of £82,000 and the addition of £62,000?—That is so.

584. In consequence of an internal legal decision?—Certainly. The Table shows that for the eleven years the Joint Committee spent on maintenance out of revenue £1,037,158 6s. 8d.

585. The amounts seem fairly stable. There has been no change of policy on your part?—No; I think not. We try as far as possible to keep it about the same level, so as not to interfere with the accounts at all. Anyhow, it is fairly done; there is no cooking of the accounts at all.

586. Oh dear no! Of course the figures depend on the policy, and your policy has been regular?—Our policy has been regular, undoubtedly. Of course, where it is an absolutely new work, that is charged as capital, and for that capital we have to go to two companies. Where we have what we consider a renewal which is partly capital and partly maintenance, there again we treat it as fairly as we can. We say such and such is the fair amount to charge to revenue, and such and such is the fair amount to charge to capital. For instance, the other day we had to put improved hydraulic plant at St. Katharine's Dock. There we put a portion to revenue and a portion to capital, because it was to replace something that was there, but which was not so good. We estimated the value of what was taken out; that we put to revenue, and the rest to capital.

587. When you put in electrical power, did you charge that all to capital, or partly to revenue?—We have been lately doing that in the London Docks, and we are not charging that to capital at all. I think, if I may say so, we have erred on the side of burdening revenue rather than burdening capital, because we consider that the proper policy. I may mention that on the 1st January next, the Joint Committee ceases to exist, and there will be one amalgamated company which will have absolute freedom to revert to the old custom, if it likes, and to charge any works over a series of years. It is only the Joint Committee's Act which has made them an administrative body which has caused any difficulty at all. Table 11 gives, I think, the information that Mr. Ellis was asking about just now. I should just like to point out that perhaps this is a little misleading. May I refer to the second column from the outside? We give the rate earned per cent., that is, the rate earned per cent. on entire capital of the company, including debentures and ordinary stock. The last column gives the rate paid on the ordinary stock.

588. I think I asked you a question about dividends on the summary in Table 7?—Yes, that follows here, I think.

589. That summary goes back very much farther than the year 1886, does it not?—Yes, it goes back to the beginning of the century.

*Mr. G.  
J. C. Scott.*  
8 Nov. 1900.

Mr. C.  
J. C. Scott.  
8 Nov. 1900.

590. So that this is a partial answer to my question?—But I think you may take it that in those early days the dividends were very much larger.

591. Table 11 contains the dividends of the London and St. Katharine Docks Company?—Yes, which up to the end of this year remains a distinct company so far as capital account is concerned. Perhaps you would like the dividends of all the companies right back?

592. No, I do not ask for that. The only reason I raised it for was this. You really seemed to make rather a point of the £1,754,000?—Yes, I think so.

593. Then if you make that point, to go into the matter fairly, one ought to know what the proprietors were receiving. You only give us it from 1866. To compare like with like you should take out of the £1,754,000 everything anterior to 1866. It is not a very great point, but if you make a point of the one I make a point of the other?—I do not quite follow you.

594. You come before this Commission, and you wish the Commission to understand that you have spent this enormous sum of money—you rather take credit for it?—I am afraid I do.

595. If you take credit for spending that money, you must give us the information how much the proprietors received during those days?—But we were rather putting it not in connection with that, but to show that we have certain property which cost the proprietors so much. In addition to that, out of the proprietors' own earnings they have added so much property.

596. Then I reply to you, but the proprietors have received such large earnings that they can well afford to pay it?—Of course.

See 5580. 597. I should like to know what they have received?—I will get that out for you.

598. If you make a point of it, I think you had better do that?—Very well. Then Table 12 gives the same statement, only set out much more at length, as to the East and West India Dock Company for the years from 1866 right down to the present time.

599. (Sir Robert Giffen.) I should like you just to state the rate earned per cent. in the case of the London and St. Katharine Dock Company, and in the case of the East and West India Dock Company, at the latest date. Tell us what the rate now is?—On the ordinary stock?

600. No, the amount earned per cent?—The amount earned per cent. last year was 3.30 per cent., that is on the entire capital of the London and St. Katharine Dock Company.

601. Then the East and West India Dock Company?—2.29 per cent.

602. This is on the capital standing in your account, and not on the total capital which you claimed to expend?—No; on the capital standing in the account.

603. (Mr. Ellis.) To the year 1868 there appeared to be net earnings, £132,000 odd, and interest and dividends paid, £140,000, the difference being made up by the payment drawn from the reserve fund. That is on Table 12. Then you say the rate earned per cent. on the capital is 6.43 per cent., and the amount paid is 6 per cent. and a bonus?—1 per cent. bonus.

604. Is that so? The payment out seems so much more than the earnings?—The £11,849 was withdrawn from reserve to add to the amount earned. That would be just about  $\frac{1}{2}$  per cent.

605. (Sir Robert Giffen.) I should like to ask you about Table 10 before we leave it. You show the expenditure for maintenance divided according to the different places which you have to maintain?—Yes.

606. This is not connected, as far as I can see, with the form in which you make up your annual account, or your half-yearly account. Would it be possible for anyone to find out what the items of this account are?—It is the same, only this is our own private return of expenditure on these different places.

607. We have no means of comparing it with the half-yearly accounts of your revenue and expenditure?—For which years would you like it?

608. Take the last year, 1899, in which you show an expenditure of £109,000 for maintenance. What are the items in the account of the Joint Committee which constitute that sum?—That I will let you have.

See 6068.

609. I should just like to see how you apply the one to the others?—We will have that probably by the next meeting of the Commission.

610. (Chairman.) Now let us go to your statement giving particulars of the property belonging to the Lon-

don and St. Katharine Docks Company and the East and West India Dock Company?—Yes, I will hand that statement in. It is important.

(The Witness handed in statement. See Appendix, 2nd day, No. 7.)

I do not know whether you would wish me to go through all the details of the different properties which belong to the Joint Committee. I mean the properties under the control of the General Committee—the two companies.

611. You mean they will be the property of one company by the 1st January?—Yes. It is set out at length. If you do not wish me to do so, I do not think there is any necessity for it, but I should like to draw attention to the table at the end of the statement.

612. Does this give the rents of all these properties?—No, it does not.

613. It is rather important to know what the aggregate rents would be. You have it somewhere, I suppose, have you not?—Do you mean the rents received?

614. Are they all in your own occupation?—Yes, they are all in our own occupation and what we do is to let them out, of course to different firms of ship-owners, who have different berths; but nothing more than that. All the property is let on short terms. We always reserve power to re-enter on short notice because we consider that in managing docks you must have that power.

615. Could you not give us some idea of the annual value?—I am afraid I could only show it from our balance-sheet, because the annual value is represented by our earnings. We could give you the rateable value.

616. What we want is to know, for instance, what the value of the warehouses is as properties. They practically give you rent, I presume, or the equivalent of rent. What is their value to you?—Take the case of St. Katharine Dock. Would you say the warehouses in the St. Katharine Dock as distinct from the water area?

617. That is what we want to separate. We want to separate the income which you get from dues and shipping, and so on, from that which you get from landed properties which are part of your undertaking?—We can show you the amount of revenue which is received in connection with earnings from ships, and the amount which is received in connection with the warehouses. Those amounts are set out separately. But it is a very difficult thing to do, and although we show it in that way in our balance sheet, and we divide it in that way for our own purposes, taking the case of goods landed in the lower docks and warehoused in the upper docks, those goods may cause a considerable amount of expense in the lower docks, but practically, except a very small proportion of the earnings, the entire earnings are credited to the upper docks, where they are warehoused.

618. That would not affect the aggregate, although it would affect the value of the particular property?—If you take the value of the whole, certainly.

619. We want the annual value of the properties other than that derived from dues and shipping?—That is shown in a table in a later portion of my evidence.

620. (Mr. Ellis.) That is in your case really?—Yes. It gives us the nearest we can get. Take last year: the income from import rates—those are rates on goods—is £994,327; export rates—also on goods—£176,929. Then you come to tonnage dues and rent on ships and discharging and extra rates on ships, £478,000; graving docks, £38,666. Import rates would cover all the profits from warehousing, but it also covers profits on what is not, strictly speaking, warehousing business, but goods passed over the quay for immediate delivery, which are not warehoused.

621. (Sir Robert Giffen.) And you cannot distinguish between the two?—I do not think we could. I think it would be quite impossible. And even if we could do that, it would be almost impossible to separate what part of the expenditure applied to the warehouses and what part applied to the shipping part of the business. If I can give you an explanation when I come to that portion of the evidence I will do it, but I am afraid it will be very difficult.

622. (Chairman.) It represents more than what you put here as rent of premises?—Yes, a great deal more.

623. That is exactly what we want to get at?—We do let a certain amount of property which we do not want—some of it for very short terms, and some, very few, for longer.

624. What we want is to separate your income as a Dock Company and your income as a Warehousing

Company?—Except so far as this table, which I have said we shall come to later on, is concerned, I am afraid that is the best we can do for you.

625. (Sir Robert Giffen.) Could you separate your income derived from the up-town warehouses from the rest of your income?—Yes, we can do that. If we take Cutler's Street, Fenchurch Street, and Commercial Road, I think we can separate those three.

626. Would it be a considerable part of your income?—No. The area for goods at Crutched Friars is 12,000 tons, Cutler's Street 303,000 tons, Commercial Road 11,000 tons, leaving out the odd figures. But then, when you get to the Victoria and Royal Albert Docks—that includes all shed space—it is 280,000 tons. But we have a very large warehousing business there for frozen meat, tobacco, jute, and grain. In the West India Dock we have a very large trade in hard wood, and in the East India Dock, a certain amount, and in the West India Dock, I ought to mention, that we have all the rum of the port. So that although we can show you the warehousing earnings of Cutler's Street, Crutched Friars, and Commercial Road, it will not represent even the greater part of the earnings of our warehousing business. I want to save time as much as I can, but this is a little important. In Appendix 7, we give you the particulars. St. Katharine Dock is the dock nearest to the City. The Tower is on one side of the road, and St. Katharine Dock on the other, and it is a very favourite Dock for short traders who are constantly coming into port because they there come within the cheapest cartage rate. At present every inch of water space in that dock is occupied. I have another statement here which I will put in.

(The Witness handed in a table showing the number and net registered tonnage of loaded vessels, from Foreign and Colonial Ports, entering each of the Docks controlled by the London and India Docks Joint Committee, to discharge, for the years 1865 to 1899 inclusive. See Appendix, 2nd day, No. 8.)

It is a little interesting when we come to St. Katharine Dock—and we go back to 1865—we find that the tonnage coming into that dock was 153,860. Last year it was 200,731, or an increase of roundly 30 per cent.

627. (Mr. Ellis.) You are not taking exceptional years, are you?—No.

628. It is a fair average?—It has gone 150,000, 140,000, 130,000. It falls off about the eighties, but since then there has been a more or less steady increase. It has gone gradually up, and the last five years would average 200,000 tons.

629. (Sir Robert Giffen.) These figures relate exclusively to the foreign trade, do they not?—If I were to add to this, in the upper docks particularly, the home trade, the figures would be very much more.

630. That is what I wished to bring out. This statement is not quite complete?—My object in drawing attention to this is to show that so far from these upper docks being practically out of date, they are being worked to-day to practically their maximum capacity. To-day in the St. Katharine Dock I could not find another berth for a shipowner who wished to have one.

631. Could you say the same of the West India Dock?—I was going to take the London Dock, where, of course, with the increased size of the ships, they cannot get up. It would not matter what your entrance was, or what your depth of water was, the biggest ships would not come.

632. (Mr. Ellis.) That is the explanation of what strikes one as curious at first, that the average tonnage of ships to the London Dock and the St. Katharine Docks falls?—A lot of the foreign trade has come more and more in large ships. It is only the smaller ships which care to run the risk of navigation in the upper river, and come into the upper docks. We do find that in the case of certain large ships which used to go up into the London Docks and discharge wool, their owners have replaced these ships with larger ships, and they cannot go. There is one case, where Mr. Lund used to bring his Australian ships up into the London Dock. He is now getting larger ships in that trade, and he has taken them into the Albert Dock. But my point is, that although these larger ships have been compelled, on account of their size, to go into the lower docks, the gap created by that diversion has been filled up from other sources, and both the St. Katharine Dock and the London Dock to-day are practically working to their maximum power.

633. (Chairman.) Your point is, that there is a class of vessels which will still do with a lower depth of water, although, owing to owners of vessels having increased the size of their vessels which used to use them, they cannot go into those particular docks, but they could go in in the lower part of the river?—Yes. The trouble is to find a place for the steamers there.

634. What is the maximum amount of tonnage of ships which can enter here in that way? This is average here, I suppose? I want to know the maximum?—Take the London and St. Katharine Dock. It is quite true, as Mr. Ellis has pointed out, that if you take the last four years, you have an average per ship of 825,905, 871, and 785. It is the smaller class of foreign ships that will come there.

635. Do vessels of 1,000 tons go there?—Yes.

636. The average is lower, but I ask you what is the largest class of vessels that enter there, and the tonnage?—To be perfectly on the safe side, I should say vessels of 1,500 tons. I think I am well on the safe side when I say that.

637. (Sir John Wolfe-Barry.) Before you leave the London Dock, is it the entrance to the dock itself, or the river that is the impeding circumstance?—The Shadwell new entrance is 366 ft. long, the breadth is 60 ft., and the depth 28 ft.

638. Then the dock itself limits the size very much there?—Yes.

639. There are two points before this Commission about the depth in the river or the depth in the dock, and I wanted to know whether it was the difficulty in the navigation or the difficulty in the dock?—So far as the dock is concerned, I do not think it is the dock that interferes there. The larger vessels will not come up the river there.

640. On account of the difficulty of navigation?—Yes.

641. Is it the question of the difficulty of navigation or the depth of water?—The upper part of the river is so crowded, and there are so many difficulties about it.

642. Then even if the depth of water were increased, you do not think they would come up?—In the old days—I do not think we are doing it so much now—in order to save the cost of lighterage of wool, we have paid ships—given them a gratuity—to come; but even that they do not find sufficient. They will not do it. The ship could get in, but it is the navigation. I do not think it is a question of the depth of water in this part of the river, but it is these big ships which do not care to come up with so much traffic there.

643. I suppose we shall hear much more about this. The depth of the water adds to the dangers?—Yes. Then the West India Dock in this statement is interesting in this way:—It shows how, without regard to the increasing size of ships, unless the dock is properly equipped, the tonnage will fall off. Take the tonnage from 1871. The figures prior to that do not really form a proper ground for comparison, but taking the figures from 1871, the tonnage entering the West India Dock was 347,774 tons, an average per ship of 336 tons. In 1891 that had fallen to 121,373 tons, with an average size of ship of 569 tons. In that year we felt that the dock itself was a good enough dock, but that its deficiency was its entrance, and we then started a new entrance at Blackwall. For the next three years the dock was practically closed. We could only work it through the South-West, but, when the dock was really reopened in 1895, it immediately doubled its tonnage. The tonnage, which had fallen down to 120,000, ran up to 236,000, and the size of the ships ran up from 569 to 1,237. Since then it has gone on increasing, and now we have every berth let in the West India Import Dock, and at the present moment we are adding certain accommodation at the west end of that dock, so as to provide another berth. I mention that again to show that the West India Dock cannot be said to be a dock out of date. Then the South-West India Dock has the deepest water of any dock in London except Tilbury. Now we are engaged in lengthening the entrance to that dock, and when the entrance is completed you will see the same thing there that you have seen in the West India Dock—an increase of tonnage. In fact, at the present moment we have applications from people who are bespeaking berths there as soon as the dock is completed. These docks meet the need of the port. I do not think the port could do without them. They are not out of date, and for the class of trade which gravitates to those

See 862-868.

docks they are admirably suited. Then, when we come to the Albert and Tilbury Docks, to save you time I propose to put in a statement which I think you will find of no little interest. We have taken out the largest ships built in recent years, and we find that there is no ship afloat that cannot enter Tilbury Dock, and that there are only 28 ships that cannot enter the Albert Dock. During the past ten years the following steamers over 7,000 tons gross have been built. In the United Kingdom 90 steamers with an average length of 490ft.; in foreign countries 30 steamers with an average length of 522ft.

(The Witness handed in a statement as to the largest ships afloat and the ability of the docks to receive them. See Appendix, 2nd day, No. 9.)

644. (Sir John Wolfe-Barry.) Are you alluding to the possibility of entering at all kinds of tides—springs and neaps?—Yes. I think I am right in saying Tilbury at all times.

645. Is that the case with the Albert Dock?—Yes, we have these vessels coming in. They have to.

646. When you say "there is no ship afloat that cannot enter," that applies to all tides in the year, does it?—Yes. Two of these steamers here are regular traders to and from Tilbury. They cannot afford to wait for spring tides. They must come.

647. It does not say so. It says "that cannot enter." You mean at high tide of every tide?—Yes. These 120 ships have included the following ships over 600 feet in length and 65 feet beam:—The "Oceanic," 685ft. 7in. length, 68ft. 3in. beam, 17,274 tons; "Campania," 601ft. length, 65ft. 2in. beam, 12,950 tons; "Lucania," 601ft. length, 65ft. 2in. beam, 12,952 tons. Those are sister ships, and just under 13,000 tons. Then we come to the "Minneapolis" and the "Minnehaha," both of which are regular traders to Tilbury, and are constantly in and out. They are sister ships, the former 600ft. 7in. length, 65ft. 5in. beam, 13,401 tons; and the latter 600ft. length, 65ft. beam, and 13,401 tons. Then there are two foreign ships over 600ft. in length and 65ft. beam: the "Deutschland," 662ft. 7in. length, 67ft. beam, 15,500 tons; and the "Kaiser Wilhelm der Grosse," 626ft. 7in. length, 66ft. beam, and 14,349 tons. The "Kaiser Wilhelm der Grosse" has been in the Tilbury Dry Dock. Thus there are only seven ships out of the total number of 120 above referred to which are over 600ft. long and 65ft. beam. All these could enter Tilbury Dock, and the "Minneapolis" and the "Minnehaha" regularly use that dock. The Albert Dock can take ships up to, say, 536ft. long. Only 18 English and 9 foreign ships out of the above 120 are over 536ft. in length. Of these seven ships which are over 600ft. long, of course the "Oceanic," the "Campania" and the "Lucania" are regular traders to Liverpool, and the "Deutschland" and the "Kaiser Wilhelm der Grosse" are regular traders to Hamburg, but there the fact remains, that at the present moment, so far as Tilbury is concerned, at high springs and high neaps any ship afloat can enter that dock; and in the case of the Albert Dock, there are only 27 ships afloat that cannot enter at high springs or high neaps. I wish to lay great stress upon these statements that I have put in now as to these docks, because I think it shows conclusively that the docks of London have not fallen behind the times, as many would say, and at the present moment we are able to accommodate, and we do accommodate, all the shipping that comes. No ship can say: "I cannot go to London because I cannot dock there."

See 9412

648. (Chairman.) Then there are other causes, I suppose, which prevent them coming here?—I do not know of any.

649. There are not the same class of vessels, one has heard stated publicly, coming into London that used to come?—Surely you have it in the instances of the five ships trading with this country which are over 600 ft. long: two of them are regular customers of London, and the other three have their fixed destinations, Liverpool and New York.

650. There is not only the question of water. There are other questions, possibly, which we will deal with hereafter?—What I wish to point out is that, so far as the docks are concerned, there is nothing to prevent any steamer afloat coming to the Port of London.

651. (Sir Robert Giffen.) Could you accommodate many more steamers at Albert Dock than at Tilbury Dock?—

Yes; we have more berths there; at Tilbury some 16 or 18, and at Albert Dock we have about 30.

652. And is the business growing so that you may require to give more accommodation shortly?—Undoubtedly, and before I have finished my evidence, I hope to put some proposals before you.

653. (Sir Robert Giffen.) With regard to the figures you have quoted from your statement as to ships coming into particular docks, I suppose the figures come really from the Customs authorities?—You will find it headed "Compiled from the Records of Her Majesty's Customs and the Records kept by the Joint Committee." Then I have a "Statement giving particulars of the trade carried on, the accommodation provided, and the governing bodies at the ports of the United Kingdom; and also showing the return on capital invested in dock and harbour accommodation at some of such ports." I will hand that statement in. (The witness handed in statement. See Appendix, 2nd day, No. 10.) I think it is not contentious at all. It is only so far contentious that we have endeavoured to correct some errors made in a statement prepared by the London County Council.

654. (Mr. Ellis.) Then it is contentious: it must be?—It is to a certain extent, but so far as we are concerned, it is not contentious, because this is all extracted from public records. I do not wish to say anything against the Chamber of Commerce or the London County Council, but they are new to the work, and I think they have made certain errors in that way.

See 3348.

655. (Chairman.) Where does that come in?—May I read the first three pages? I think that will explain the whole thing.

656. Very well?—"The first portion of the accompanying return is based on information furnished in most cases by the Port authorities. In cases where no reply has been sent to the inquiry, "Lloyd's Register of Shipping" and the "Shipping World Year Book," and other sources of information, have been consulted. Though the various authorities do not always agree, the return will, it is believed, be found generally reliable."

657. We could not take this as evidence. It is only furnished by the Port authorities. We should have to get the evidence from the Port authorities?—Might I not read it?

658. (Mr. Ellis.) It would never do to take it in that way?—Is the report of the County Council evidence?

659. (Chairman.) That has not yet come before us officially?—Then may I just put this in, not as evidence, but as information?

660. It cannot be taken as evidence?—Then I will not read it at all, but I think you will find a good deal of information in it.

661. Of course it is on the same ground as that of the County Council, which we shall treat in the same way. It is information to be tested?—May I venture to assure you that we do not put this in with any idea of trying to run our heads against the County Council at all, but our object throughout has been with regard to any information that we have at our disposal to place it fully at yours.

662. It is not evidence at all?—Then I propose to go to the next portion of my statement.

663. (Mr. Ellis.) That will begin your case?—I shall now begin my case, having cleared off all the historical and statistical portion of it.

(Chairman.) We should like to discuss privately how we are to commence on Tuesday, because we are now coming to a matter which requires some consideration. It is not a question as to how we are to receive the evidence, but the question is in what order we shall receive it.

(The Commissioners retired and deliberated.)

See 277.

(Chairman.) The Commissioners have considered whether they should continue your evidence at the present time or not, and they have come to the conclusion that they desire to hear your engineer as to the physical state of the docks before they enter into questions which may have to be gone into at considerable length, and with which they may have to deal later on. We shall therefore be prepared on Tuesday to take the evidence of your engineer, and also to hear representatives from the other dock companies, the Millwall Dock Company and the Surrey Commercial Dock Company. We want to deal with the physical facts before we go into questions of future policy as to the raising of rates and so forth. We reserve to ourselves to decide when we will

go into these questions, which you will have to deal with later on. We want to deal with the main physical facts of the different bodies connected with the Port of London before we go into any extensions or future plans.

(*The Witness.*) Then I understand that on Tuesday you would like our engineer, Mr. Baggallay, to attend.

(*Chairman.*) Yes, he will then attend to give us full evidence on the points I have mentioned.

(Adjourned to Tuesday next, November 13th, at 12 o'clock.)

## ROYAL COMMISSION ON THE PORT OF LONDON.

### THIRD DAY.

*Tuesday, 13th November, 1900.*

#### PRESENT :

The Right Hon. The EARL EGERTON OF TATTON (*Chairman*).

The Right Hon. LORD REVELSTOKE.

Sir ROBERT GIFFEN, K.C.B., LL.D.

Sir JOHN WOLFE WOLFE-BARRY, K.C.B., LL.D., F.R.S.

Rear-Admiral Sir JOHN HEXT, K.C.I.E.

JOHN EDWARD ELLIS, Esq., M.P.

CECIL OWEN, Esq., *Secretary*.

(*Chairman.*) I wish to make a statement to the parties who are appearing before the Royal Commission, to this effect. The Royal Commission are desirous of hearing independent and official witnesses from public bodies and others interested in the trade and the Port of London, and of considering any proposals for improving the docks or deepening the waterway of the Thames, before hearing any evidence as to the means by which funds could

be raised and administered for those purposes; and they will undertake to give to all parties affected by any new proposals involving the alteration of dues, tolls, or other charges, full opportunity of being heard either by counsel or otherwise, as the Commission shall determine, and to subject the supporters of any such schemes to cross-examination.

Mr. GEORGE LISLE RYDER, C.B., called and examined.

664. (*Chairman.*) You are Chairman of the Board of Customs?—Yes.

665. For how many years have you been connected with the Board of Customs?—For only one year and about nine months.

666. As Chairman?—I was new to the Department when I was made Chairman.

667. Had you any opportunity of considering the questions affecting this Royal Commission before your connection with the Board of Customs?—The Board have given their best consideration to the matters referred to the Royal Commission.

668. But I ask you whether you personally, before your connection with the Board of Customs, had given any attention to these subjects?—In no way.

669. Now will you go on to the next question? What is the opinion of your Board?—May I follow the statement of proposed evidence that I have submitted?

670. Yes?—The Commissioners invite the Department to make any suggestions that may occur to them with regard to the well-being of the Port of London as a whole, and especially the remedying of the disadvantages arising from the shallowness of the river and the distance of the Port from the sea. I there refer to Questions 443 and 444 of the second day's evidence. The only part of Her Majesty's reference to the Commissioners that directly touches the Customs is "the arrangements for warehousing dutiable goods," and this Department could not pretend to speak with any sort of authority upon the commercial administration of the Port and waterways, and the adequacy of, and system of charge for, the accommodation for vessels and their cargoes. At the same time, it is undeniable that the scattering of wharves and warehouses over many miles of river, and the necessity of unloading vessels into lighters which carry goods of a duty value of many hundred pounds at a time, by night and day, to otherwise inaccessible landing places, cause much trouble and expense to the Customs, and risk to the Revenue. From a departmental point of view

therefore measures that would mitigate these inconveniences could not be otherwise than acceptable. Our position, however, is necessarily one of neutrality. The dock companies, lightermen, and wharfingers may in certain respects have antagonistic interests, but the Customs are the friends and well-wishers of all those bodies, and could not properly suggest steps which might favour one at the expense of the others. At the same time, it must be remembered that whilst this department takes a warm interest in all that concerns the prosperity of that great city in which its headquarters are situated, for which so many of its members have a life-long attachment, and which is united to it by ancient traditions of friendship, it necessarily regards the fluctuations of commerce from the broad standpoint of national welfare rather than of the interests of sections of the community, or of the inhabitants of particular towns or quarters of towns. It is not for this department to attempt to direct the course of trade. We follow trade wherever it goes, in obedience to the two principles that govern our action in all cases, viz., the security of the revenue and the convenience of the merchant. We would request the attention of the Commissioners to the fact that a decrease of imports and exports by the River Thames does not necessarily mean a decrease in the commerce of London. The use of steamers, the larger size of ships, and the extension of railway communication have not merely caused the docks and quays of the capital to move nearer to the sea, so that the practical (as distinct from the legal) Port of London may now be said to stretch from London Bridge to Queenborough. The further effect has been that London, so to speak, stretches her feelers out to various ports on the east and south coasts, and draws through them much of the commerce that used to come by the Thames. To judge properly of the decrease or increase of London trade, we must include in our survey such ports as Dover, Folkestone, Harwich, Newhaven, and Southampton. Perhaps the Commissioners will permit us to give a few figures in illustration of our meaning:—

Mr. G. L.  
Ryder, C.B.

See 725-731  
and 753-770.

*Note.*—(1) Goods transhipped under Bond are not included in Imports and Exports. Their amount for 1899 was about six and a-half millions.  
(2) The decrease in British and Irish Exports from London is accounted for by increases at Middlesbrough, Hull, Liverpool, Newcastle, and Glasgow.  
The decrease in Foreign and Colonial Exports from London is partly accounted for by increases at Hull and Liverpool.

The general effect of these figures is to show that relatively to the trade of the United Kingdom there has been a certain falling off in London. If we turn to the last table, we find that for London in 1873—a year chosen because it was a very prosperous one—the proportion borne by the imports of London to the imports of the United Kingdom was 34·35, and in 1899 the proportion sank to 33·83.  
671. (*Sir Robert Giffen.*) That was a smaller proportion of a much larger trade?—That is so. It was a very

much larger trade in volume. That is a most important consideration, and I propose to give a few figures to the Commissioners later on, to prove what Sir Robert Giffen has said. If you take the five ports that I have mentioned—the five ancillary ports, as I may call them—we find that in 1873 their imports in proportion to the trade of the United Kingdom were 8·5, but they had risen to 13·36 in 1899. Then, in the case of the exports of British and Irish produce, we find certainly evidence of proportional decrease. In London the

figures are 22.41 for 1873, and 20.30 for 1899, and for the five ports named they were 7.52 in 1873 and 6.34 in 1899. In the exports of foreign and colonial merchandise we find that for London in 1883—for we cannot give the figures for 1873—the percentage was 60.92, which sank to 52.98 in 1899, and the like exports from the five ports show again a sinking; 13.74 in 1883 falls to 10.32 in 1899. These tables show more or less of stationariness or even decrease in the Port of London, but they also show how far this has been compensated for by growth of business at what may be called her daughter ports or creeks, which draw goods from all parts of the world and send them to London for sale or warehousing.

672. (*Mr. Ellis.*) I notice that in the third column of the table the percentage of the decrease appears to be greater than the increase in the first two columns; that is to say, the percentage of decrease of exports of foreign and colonial merchandise appears to be greater than the increase in the imports and exports?—That is true.

See  
11563.

673. Could you give us—perhaps not offhand—the relation that the total of the exports of foreign and colonial merchandise bears to the imports and exports. Do you see my point?—Yes. I am afraid I cannot give you that at once, but we will do our best to furnish it.

674. That bears upon your phrase, “less of stationariness or even decrease,” does it not?—Yes, it does. What I should like to do now is to say a few words upon the point raised by Sir Robert Giffen, and perhaps I may be allowed to read what has been given to me by a great authority upon the subject, my fellow Commissioner, Mr. Pittar.

675. (*Chairman.*) Do you put that in as a document from the Board, because we do not allow second-hand evidence?—He is a member of the Board, and you may accept what he writes as the evidence of the Board.

676. You put it in as from the Board?—Yes. I will read it then.

“A good deal has been said and written about the falling off in the overseas trade of London. It is, however, difficult to see how such a proposition can be sustained by figures. If due allowance be made for the great fall in the prices of commodities since 1873 (a cause which of course results in concealing or masking the greater quantities of merchandise represented by the totals in the trade returns in the years of low prices) it will be evident that there has in fact been no falling off, but, on the contrary, an enormous increase in the imports and exports of the Port of London. In support of this statement the following arguments may be cited: Mr. Sauerbeck's index number of prices since 1877 (which year is chosen as presenting no specially abnormal features) has fallen from 94 to 68, or 27.6 per cent. Roughly speaking, we may say that £66 represented as much merchandise in 1899 as £94 represented in 1877. Therefore, while the declared value of the overseas trade of London in 1899 was in excess of 252 millions, as against nearly 226 millions in 1877—an increase of only 26 millions in 22 years—yet if we consider that the volume of goods represented by the 1899 figures amounts to something like 348 millions if expressed according to the prices that prevailed in 1877, it will be seen that there has really been a most significant increase of commerce in the 22 years. Of course the Royal Commission is very well aware of the necessity of taking the alteration of price into account. But the general public and merchants, when consulting the returns, very commonly compare the absolute figures of the declared values in different years as if they really represented the difference in the business done. The tonnage figures of the Port afford corroboration of the view that there has been a vast increase of trade. Comparing for the same two years, the tonnage of ships (with cargo) which entered inwards and cleared outwards from London, we have—

	1877.	1899.	Increase per cent. in 1899.
	Tons.	Tons.	
Entered - - - -	5,583,792	9,244,593	65.2
Cleared - - - -	3,138,799	6,042,050	92.5

Also it may be noted that the average tonnage of importing vessels rose from 472 tons in 1877 to 850 tons in 1899. This increase in the size of ships is, of course, really one of the great difficulties with which the Port of London has to contend. The warehouses are for the most part in the upper reaches of the river, whilst the large modern vessels cannot come up higher than the Victoria and Albert Docks, and the very largest cannot find dock accommodation nearer to the city than Tilbury. The London of the future may possibly provide quay and warehouse accommodation along the banks of the river for steamers of great size, but, in view of the keen competition of other ports, home and foreign, there may probably be, for many years to come, some difficulty in disposing of the cargoes of first-class vessels discharging at a distance from the exchanges, the markets, and the existing warehouses.”

Wherever London finds it convenient to transact her import and export trade the Customs plants its officers; and approves the requisite quays and warehouses; and it is not for this Department to suggest that there should be any interference with the outlets and inlets which commerce is finding by a natural process for itself. Perhaps, however, the Commissioners will object that their concern is not with the trade of the Metropolis, as a whole, but with that of the Port of London exclusively, and that they want to know whether the Customs can suggest some concession that will benefit that port by compensating for its peculiar disadvantages. To such a question we regret to reply that, in our opinion, it would be of most doubtful expedience to make any concession, in the matter of Customs arrangements, to the Port of London which we were not prepared to extend to other ports. The trend of modern policy has been in favour of uniform practice in London and the outports, and many differences of old standing have been removed. Nevertheless, there is one matter in which we think that, subject to the sanction of the Treasury, some concession might perhaps be made in London, and in all other ports where it seemed to be required, and that is the number of hours in a day during which Customs officers attend for the bringing to account of dutiable goods, whether on prime entry or for warehousing, without charge to the merchant. In former days, when all Customs officers were paid by fees for the services that they actually rendered to merchants, and had no salaries, limitation of hours was of little consequence. The officers attended when wanted, like medical men. But early in the nineteenth century, when our bonded warehousing system began to assume large dimensions, the officers were placed on salaries, with definite prospect of pension, and great jealousy was shown of supplementary earnings from merchants. I mean jealousy on behalf of the merchants and the Customs both. An inevitable result of this important and beneficial change, for both sides, was the fixing of hours, service during which was to be held to be covered by the salary. And these hours were fixed accordingly under statutory powers, either by Treasury warrant, or Board's order, at 8 to 6 hours a day, when the day was the unit, or 48 hours a week when the week was the unit. By Section 7 of the Customs Consolidation Act, 1876, the Treasury can appoint the hours of general attendance of the Commissioners and officers of Customs and other persons in the Customs service; and the Board can appoint the times during such hours at which any particular parts of the duties of any such officers and other persons shall be performed. And by Section 9 of the Customs and Inland Revenue Act, 1881, it is enacted that with the exception of diamonds, bullion, lobsters, and fresh fish of British taking, in British ships, no goods may be landed on Sundays or holidays, except by special permission of the Board, nor on other days between any hours than from 8 a.m. to 4 p.m. from 1st March to 31st October, and from 9 a.m. to 4 p.m. for the remainder of the year—or between such other hours as the Board may appoint. The above mentioned hours were the same as had been prescribed by the Treasury and Board for warehousing hours; and it was not found necessary to make any definite and permanent difference between landing and warehousing hours until 1891. In that year the Goschen minute, issued by General Order 24-91, fixed the hours for landing free goods without charge by the Customs at from 6 a.m. to 6 p.m. These hours were made universal in 1894. But subject to a few traditional local differences, warehousing hours are still

*Mr. G. L.  
Ryder, C.B.*  
13 Nov. 1900.

Mr. G. L.  
Ryder, C.B.  
13 Nov. 1900.

those named in the Act of 1881 as those for landing. Attendance outside the above hours must be paid for by the merchants who ask for it. In considering the expedience of any prolongation of free hours of attendance of Customs officers we must remember (1) that habitual attendance for over eight hours' work a day implies an increase of staff, because it can only be provided for by an overlapping arrangement, under which part of the staff come and leave early, and the rest come and leave late; (2) that prolongation without charge releases the merchant and wharfinger from the valuable check against needless or wanton demands for extra attendance, that is afforded by having to pay for it; (3) that the boom may prove in reality to be of little value to the merchant though costly to the Exchequer, because the Customs charge for extra attendance is small compared with the other charges entailed on him for labour by prolonged hours. If he wishes to land goods at midnight for solid reasons, the Customs charge will never stand in his way. May I now, my Lord, interpolate another part of Mr. Pittar's memorandum which the Board entirely adopt. I think he gives what I may call a fourth consideration that should always be borne in mind if we consider any prolongation of hours. "It is probable that the effect of Customs supervision and Customs regulation upon the trade of London has been unconsciously exaggerated. In reality the sphere within which the necessary fiscal restraints are felt is extremely limited in comparison with the magnitude of that trade. The following is—in round figures—a statement of the foreign trade of London in 1899:—

Value of Imports	£ 164,100,000
„ British and Irish Exports	53,700,000
„ Foreign and Colonial Exports	34,500,000
Total Exports	88,200,000
TOTAL Value of Foreign Trade of London	252,300,000

Of the London total of 252½ millions, only about 24½ millions represent dutiable goods. The remaining 228 millions are free from Customs control after the very slight and partial examination which constitutes the Customs clearance of free goods upon importation. It is important, therefore, that it should be understood that over 90 per cent. of the London foreign trade suffers no impediment from the existence of a Customs barrier in the Thames, except in so far as it is necessary to secure the consent of the Customs Department to the discharge of vessels after 6 p.m., so that an officer, or officers, of Customs may be present. In the discharge of its responsibilities as guardian of the Revenue, the Board of Customs are, of course, bound to retain thus much of control." If, however, the Royal Commissioners are convinced that some concession in this direction is desirable, and the Treasury were disposed to sanction it, we think the most useful form it could take would be an extension of the Customs warehousing hours from 4 p.m. to either 5 or 6 p.m. If the extension were to be to 6 p.m., perhaps the opening might be deferred until 9 a.m. The hour from 8 to 9 a.m. is often one of very little business. As an index to the value that an extra two hours in the afternoon would be to the Port of London, we give the payments made by merchants for attendance from 4 to 6 p.m. in bonded warehouses in London during the year ended 30th September, 1900.

	£	s.	d.
In Tobacco Factories	276	16	3
In Bottling Warehouses or Compartments	217	15	6
In all other Warehouses	2,481	7	9
	£2,975	19	6

The sum paid for extra attendance at all other hours, during the same period, in London, was £1,721 2s. 8d. The cost of extending the concession to the outports may be estimated at about £1,500. It must not be supposed that we commit ourselves to definitely recommending such a concession. We simply suggest it as one that Her Majesty's Government might be prepared to take into consideration if the Commissioners were to recommend it.

677. (Chairman.) Is that the whole of your evidence?—Yes, that is the whole of my evidence.

678. Does not the competition of other ports—especially

foreign ports—render despatch more necessary than it was ten years ago?—I should think that is the case.

679. And do you find that more extra hours are paid for by shipowners than were paid for ten years ago?—I understand that they pay less than they used to pay.

680. Less in amount?—Yes; that they pay less for extra attendance; but I am afraid I cannot speak with quite certainty.

681. About ten years ago the Goschen minute fixed the hours from 6 a.m. to 6 p.m.?—Yes, that was so for the landing.

682. In some of the docks is it not the fact that the hours of 9 a.m. to 4 p.m. govern the whole of the work in the docks?—So far as regards dutiable goods.

683. When the Royal Commission visited the docks in July they found that at 4 o'clock in the afternoon there was a suspension of work?—That would be so for tobacco and spirits.

684. There appeared to be a general suspension of work?—Yes.

685. Do not those hours govern other goods as well?—I should have thought they need not do so.

686. But as a matter of fact they appeared to do so?—They are prescribed for only about 10 per cent. of the trade of London—the dutiable part.

687. It might be quite possible that the dutiable part affected the other part as well?—It is possible, but I should have thought that need not be.

688. Then the concession which you suggest would not be a very expensive one for the Treasury?—It would be several thousands a year. I do not think the Treasury would think lightly of anything like £4,500 a year.

689. But is it not a fact that for some reason or other London has the reputation of being a dear port, and would not that be one of the elements in decreasing the charges which shipowners have to pay in bringing goods to, and dealing with them in, the Port of London?—That certainly would be a reason, but I doubt whether the Board and the Treasury would think it right to make any concessions specially to London.

690. I can quite understand that it might be just the same at Liverpool or Manchester or Southampton, and other ports?—Exactly.

691. You say the other ports would not matter so much, because there are not so many dutiable goods. We were told before that a very much larger proportion of dutiable goods came to London than to the majority of the other ports?—Yes, and that is evidenced by the very much larger payments for extra attendance in London. See 408-9.

692. Naturally for the same reason?—Yes.

693. Therefore the concession in other ports would not be a very large pecuniary concession?—About half as much as it would be in London.

694. Over the whole of the ports of England?—Yes.

695. That is a very small proportion, of course?—Yes.

696. (Sir John Wolfe-Barry.) Do the figures that you gave in your evidence include all the payments made, whether for dutiable goods or in respect of free goods?—There would be no charges in respect of free goods for those hours between 4 and 6. See 676.

697. But suppose a ship comes in with free goods and desires to continue unloading for part of the night or the whole of the night, would not she have to pay for a Customs official?—Certainly, she would have to pay for the attendance of the Customs officials.

698. Then what I mean is this: Are there any payments made in respect of such service as that in respect of free goods which are not included in the figures you gave?—Certainly, only those payments would not be in respect of the hours from 4 to 6; they are free hours.

699. Then what payments are made for extra hours in the Port of London?—Taking the whole trade of London, what extra payments are made for Customs supervision, whether on free goods or dutiable goods or mixed cargoes?—I am afraid I have not got that.

700. Would there be any difficulty in preparing a return of that sort?—All that I have is a statement of the overtime paid by merchants for the attendance of officers in bonded warehouses. That, however, is confined to dutiable goods. I have not got the information as regards free goods, but certainly it could be obtained.

701. I think we should like to have that—

(*Chairman.*) You mean in cases where there are mixed cargoes of free and dutiable goods?

702. (*Sir John Wolfe-Barry.*) Yes. There are three cases of payments for extra hours; there are those that you have given us already in connection with dutiable goods into warehouses; then I think the Commission would like to have all the payments that are made for extra hours attendance of Customs officers for the discharge of ships with free goods or the discharge of ships with mixed cargoes. We should like to know all the money that is paid for overtime to the Customs in connection with the trade of London?—We certainly can give the information; it is merely a matter of time in collecting it. I may say that speaking roughly the total payments by merchants for overtime attendance for the United Kingdom is a little under £30,000 a year. We show that at the foot of our estimates every year.

See 11663. 703. Then perhaps the return would show that as well. If you give a return for London you might also include the outports as well?—Certainly. It will take some little time, but there is no difficulty in doing it.

704. What I think we should like to know would be the burden, such as it is, upon the trade of London in respect of all overtime paid to the Customs—

(*Mr. Ellis.*) And all the elements of the burden.

(*Sir John Wolfe-Barry.*) And possibly if you could discover it into the elements it would be better—as to whether they were on wholly free cargoes or mixed goods or goods which were wholly dutiable.

705. (*Chairman.*) That bears on the question I asked just now—whether free goods are delayed in their work by the possibility of having extra charges to pay for the attendance of the Customs officers to other parts of the cargo which may consist of dutiable goods?—I was not aware of it, and I think if it is the case we ought to try to remedy it.

706. I want to know the reason why the Commission found in July—in the middle of the summer—that a great deal of the work was ceasing at 4 o'clock. I think that is what we found, and I want to know whether the Customs are indirectly responsible for creating that state of things?—I do not think we wish that state of things at all. It may be a matter for the workmen.

707. I want it cleared up. I want to know whether it was an accident that we saw it or whether it is the usual thing?—I will endeavour to find out how far any action of the Board contributes to that kind of thing.

708. (*Sir John Wolfe-Barry.*) May I ask what is the way in which a ship is unloaded subject to Customs supervision. Suppose a ship first of all comes into the river with a large cargo part of which may be dutiable and part free. Must the unloading stop at a particular hour, whether dutiable goods are being landed at the time or free goods?—In ordinary course the unloading would stop at 6 p.m.

709. In the river?—Wherever she was—wherever she was being unloaded.

710. In the river or in the dock?—Yes.

711. (*Chairman.*) But why should it stop at 6 p.m. in the summer months?—It may go on beyond 6 p.m. if the merchant likes to pay.

712. Then the shipowner has to pay an extra charge?—Yes.

713. To that extent, then, the action of the Customs prevents the unloading of vessels as rapidly as it otherwise could be done in the summer months; is not that so? It has a tendency to check the unloading of vessels, because the ship has to pay an extra charge?—It has a tendency to check the unloading after 6 p.m.

714. I say, after 6 p.m. In the summer months it might go on till 8 or 9 in the evening?—No doubt. It is 4 p.m. for dutiable goods and 6 p.m. for free goods.

715. (*Sir John Wolfe-Barry.*) Must there be a Customs official on board all the time discharging is going on?—A watcher, I believe, is enough. Mr. Fleming draws my attention to General Order 75 of 1872, under which “the discharge of cargoes of free goods in bulk and of fibrous goods in packages is allowed to be carried on under certain conditions at any hour of the day or at night, without any expense to merchants in respect of any consequent overtime attendance on the part of Customs officers.” But apparently that order has been

so far modified that “any overtime expenses incidental to such discharges between the hours of 6 p.m. and 6 a.m. will be defrayed by the merchants.”

716. (*Chairman.*) Then that does not fall on the shipowner?—Yes, it would fall on the shipowner, I presume. “As, however, in the Port of London, these discharges are almost exclusively supervised whether by night or day by the waterguard only without expense for overtime, the same practice is to be continued subject to the regulations of General Order 94 of 1887.” Apparently there are some bulk goods which are discharged at any time of the day or night without charge for the Customs.

717. (*Sir John Wolfe-Barry.*) Then how do the Customs know what are being discharged from a large ship? If they begin discharging any dutiable goods, how do the Customs know that dutiable goods will not form part of the cargo? Do they go entirely by the bill of lading?—Not entirely. Every ship must be boarded by a Customs officer.

718. But they cannot examine the whole: do they trust to the bill of lading?—To a great extent, I expect they must do so, but they keep an eye on what is going out, and I think I am right in saying that they examine about every tenth package in the case of cased goods; that, however, would not apply to things like bricks, and coals, and heavy things like that.

719. What I was trying to get at is, how much supervision is exercised over the discharging of ships, whether carrying dutiable goods or free goods, and what amount of delay is caused to the shipowner. I am afraid I cannot quite understand it at present?—The Solicitor to the Customs has just drawn my attention to the fact that, before any goods can be unloaded, they must be entered; that is to say, a document describing them must be passed in the Long Room.

720. Then, if they are shown to be free goods, can they be discharged throughout the night without any supervision?—I believe not, except in the case of those bulk goods about which there is no suspicion at all; but as regards case goods, there must be a certain amount of supervision, because one never can tell that inside a case that professedly contains free goods there may not be some eau de Cologne or some cigars.

721. I think you said something about the advantages of deep water. Had you in view then deep water in the river so that ships might go alongside the wharves and avoid the lightering?—That is one of the plans for relieving the Port of London from its present disadvantages.

722. So as to lessen the amount of lightering?—Exactly.

723. That would not, of course, affect the amount of lightering from the docks to the warehouse to a great extent, but it would diminish the lightering from the ships in the stream to the warehouse?—To the wharves up the river.

724. And also the lightering would be greatly diminished, I take it, if, for example, from Tilbury the lighters had not got to traverse so long a course in the river owing to the absence of warehouses at Tilbury or at the Victoria Dock?—Yes.

725. (*Mr. Ellis.*) I want to take you back to the tables you put in at the beginning of your evidence. You have reminded us that in estimating trade we must consider not only values but tonnage. Now suppose that tonnage were considered in respect of London and the five ports mentioned, would it make any change in the inference to be drawn?—These tables deal only with value, and the reason for that is that there is no other common measure that can be found for the great variety of goods that come in. But it is most important to remember that if you take volume and quantities of goods into account, the lesson that you draw from the tables is something very different.

726. I am quite aware of that, but I am asking you this specific question: whether you can say that the inference to be drawn from this table would be different if tonnage were taken instead of value?—By tonnage I understand you mean the weight of the goods—not the tonnage of the vessels carrying them but the quantities of the goods.

727. Exactly the same as we saw in that interpolation of your fellow commissioner?—I think what he said was that it is of the greatest importance to remember —

728. I appreciate the importance of it, but what I

Mr. G. L. Ryder, C.B.

13 Nov. 1900.

Mr. G. L.  
Ryder, C.B.

13 Nov. 1900.

want your answer upon, if you can give it me, is whether the inference to be drawn would be different if "tonnage" in his sense of the word were substituted for "value"?—I think I see what is meant. Suppose we put values aside, and made the same kind of table—a percentage table—dealing with quantities only, we might arrive at very different results.

729. Would it be so?—I think it probable, but the great difficulty is that we should have to make separate tables for all the different leading kinds of goods. We cannot add corn and wine together.

730. I am not dealing with the difficulty; I am quite aware of that. My point is this; you interpolated from a fellow commissioner a suggestion that in certain cases we should not only deal with values, but that we should consider tonnage or quantity. I am asking you whether if the same process were applied to this table a different result would be arrived at?—I think it would look much more favourable to the Port of London; that is my full impression; but to prove it we ought to laboriously make up tables for each of the leading kinds of goods.

731. I think I have got what I wanted. Your impression is that it would be distinctly favourable rather than the reverse?—Oh, yes.

732. We shall get the figures in other ways. Then with regard to the concession of hours—do you appreciate what I mean by that?—Quite.

733. As far as I understand it would cost £3,000 a year for London and £1,500 a year in round figures for the outports?—That is our estimate.

734. Do you think that if the concession were made all round it would in any way favour the Port of London? Would it alter the relative position of London favourably or otherwise?—I should expect really very little result from it—very little.

735. It would be simply that instead of the shipowner or the purchaser of the goods bearing the cost of the extra labour the taxpayer would bear it?—That would be so.

736. And it would not make any difference to London in comparison with the other ports?—I think it would be insignificant. It would touch such a small area of London trade, for one thing.

737. My last question relates to this very serious matter of the disadvantage of the Port of London. Mr. Fleming used in his evidence the phrase: "The peculiar disadvantage of the Port of London is that the deep water required by large modern vessels is far away down the river at a distance from the warehouses and the centres of the markets," and I notice that your fellow commissioner uses the same phrase, and you spoke of "the peculiar disadvantages of London" too. Now, what I desire to ask you is, do the Board of Customs consider that "the peculiar disadvantages of the Port of London"—to use your own phrase, are increasing or decreasing relatively with other ports?—I should have rather thought that they were increasing relatively to other ports, but I feel that I can speak with very little authority on that point.

738. Of course, you only speak for the Board of Customs?—I speak for the Board, but I must speak with the utmost reserve upon such a question, because I cannot say that I have paid personal attention to it.

739. You will understand that we shall have any amount of evidence on the subject; I only want to get your impression as the head of the Board of Customs, and I think your impression is that it is increasing?—I should have said that the disadvantages are relatively increasing.

740. (Sir Robert Giffen.) I should like to ask you, with reference to these figures showing the proportion of the trade of the Port of London that consists of dutiable goods. Mr. Pittar in his memorandum enumerates imports and then exports of British and Irish produce and exports of foreign and colonial produce, but I do not think he refers in that statement to transhipment goods, which may be more important in the Port of London than in the outports?—It is quite true; he excludes transhipment goods.

741. And they would be more important in the Port of London than in some of the outports?—Certainly more important in London than in many of the outports, that is perfectly true. I see that from 1889 to 1899 the "Imports, transshipments," that is, transshipments under bond, have ranged from 4.8 millions to 3.3 millions, and the percentage borne by the London

transshipments to the whole of the United Kingdom was, in 1889, 47.81 per cent., and in 1899, 30.98.

742. That is rather a diminishing element in the Port of London compared with others?—Yes, a diminishing element.

743. It would not alter the proportion of 10 per cent. very much?—It would not.

744. On the other side there is a circumstance that would perhaps rather diminish the percentage of dutiable goods—these figures do not include gold and silver?—I believe they do not.

745. And a very large amount of gold and silver is imported and exported at the Port of London?—Yes.

746. We do get the figures, but they are in a separate statement?—Yes.

747. Then with reference to what you said at the beginning about the scattering of wharves and warehouses over many miles of riverside, and your having so many places where duties are paid, do you consider that the Customs have to encounter special difficulties in dealing with the revenue in the Port of London, that it is perhaps a little more difficult to make the revenue secure; and that they are put to more expense in consequence?—I think there is no doubt that that is the case.

748. That London is a particularly difficult and expensive port for the Customs to deal with?—Exactly.

749. But you are not aware that the difficulty which the Customs experience is reflected in greater expense to the trade. You endeavour to put the trade of all the ports upon an equal footing?—So far as we can.

750. Do you think there is any balance of disadvantage to the merchants and shipowners of London compared with others in consequence of that scattering of wharves and warehouses?—I have no doubt that it must cause great expense to merchants. I should have thought that merchants would have saved a great deal of money if there was a greater concentration of warehouses and quays and accommodation for vessels.

751. On the other hand, goods must be distributed; you must not merely concentrate them, but you must send them to different points where they can be distributed?—Yes, it is perfectly true that they must be distributed in the end, but I should have imagined that there would have been a great convenience in a concentration, were it possible, of business premises.

752. And you believe that on the whole this dispersion of business that seems to be connected with the general conditions of the Port of London imposes some expense on the trade as compared with other ports?—I should have thought that that was the case. Mr. Fleming, I think, agrees with me that that is so.

753. Then coming to your tables: the whole object of them is merely to show the diminishing proportion of the whole trade which London has as compared with these five "daughter ports," to use your phrase?—Yes, if we take values.

754. But it is a diminishing proportion in any case. Would not that be so?—

(Mr. Ellis.) That is exactly the question I asked, and I understood that his answer was, No.

(Sir Robert Giffen.) It would be a diminishing proportion, although the absolute amount of the trade, if you take account of quantities, may be always increasing. The proportion of London is a diminishing one.

(Mr. Ellis.) If you take values.

(The Witness.) Yes, judging from values. I really cannot tell how far it would be altered if we took quantities. It might be altered, and it might not.

755. (Sir Robert Giffen.) But assuming value as a common measure, it shows a diminishing proportion of London as compared with the other ports?—Yes.

756. But the truth is, at the same time—which is not quite apparent on the surface of the figures—that it is a diminishing proportion of a greatly increasing trade in bulk?—True.

757. So that although taking the first table of imports, the proportion of London, which was 34.35 in 1873, has fallen to 33.83 in 1899, yet the trade itself has enormously increased?—Enormously grown.

758. And is it not the case that even in value, as far as imports are concerned, there is a very large increase

See 368.

of value in the case of London, because in 1873 the value is £127,000,000 sterling, and in 1899 £164,000,000?—Quite so.

759. But when you come to the exports of British and Irish produce, and the exports of Foreign and Colonial produce, you find that in these cases, contrary to what is the case with the imports, the values in each case diminish?—That is the case.

760. And the value appears to diminish quite as much in the case of the daughter ports as it does in the case of London—I am speaking of exports now?—Yes.

761. The impression of these two tables would be altered somewhat if you considered that the quantities of goods had increased, but the proportion is a diminishing one in all cases in London?—That is so.

762. But would it not also be the case that if the proportion of Dover and Folkestone and Harwich and Newhaven and Southampton also diminished, then some other ports in the United Kingdom must have been gaining in proportion at the expense not merely of London but of all these ports as well?—That is true, and it is referred to in one of the notes: "The decrease in British and Irish exports from London is accounted for by increases at Middlesbrough, Hull, Liverpool, Newcastle, and Glasgow. The decrease in Foreign and Colonial exports from London is partly accounted for by increases at Hull and Liverpool."

763. Would not it be the case then that London to some extent is served by such ports as Bristol and Liverpool and Hull?—No doubt. Every British and Irish port, perhaps, in a sense serves London.

764. Can you say anything as to the course of trade in particular articles—whether it is less or more as regards London as compared with Liverpool or as compared with Hull, than it used to be?—The question is a very interesting one, and I wish I could answer it at the moment. I understand that it is whether we can mention any particular articles of importance, the trade in which in London has been sinking, and the trade in which in outports has been growing.

765. Not altogether that: whether the goods are brought to Liverpool or to Hull and then brought on to London, instead of coming by sea to London: say, such goods as tobacco, tea, sugar, and other

articles?—My impression is that tobacco from Liverpool goes to Bristol more than to London. I think the best answer is to say that I am unable to give the information at the moment, but I will endeavour to procure it for the information of the Commission.

766. (Chairman.) Could you tell us about the re-exportation of tea and coffee at the present time as compared with what it was say ten years ago, before the active competition of some of the foreign ports, such as Hamburg and Antwerp. We want to know how much London appears to have lost by the competition of foreign ports?—I am afraid it would mean a sum in arithmetic.

767. It is rather important to find that out, and also whether it is the case with any of the Colonial imports. Tea and coffee are imported from the Colonies, I suppose?—Yes.

768. (Sir Robert Giffen.) And also wool?—Yes.

769. (Chairman.) Wool, as I understand, originally nearly all came to London, and now it does not. Is that so?—I believe that is to a certain extent the case.

770. We should like to know with regard to some specific articles such as tea, coffee, tobacco, and wool, what the effect during the last ten years has been of either competition of other ports in England, or other ports abroad?—We will do our best to get the information and give it to the Commission.

Now I beg to hand in three returns which have been prepared in response to the request of the Commission. They are as follows:—(1) An account of Customs duties received on goods delivered at each dock, wharf, or warehouse, in the Port of London, showing the principal and all other articles paying duty, together with the quantities of the principal articles, for the year ended 31st December, 1899. (See Appendix, 3rd day, No. 1.) (2) A return of the number and tonnage of vessels entering Queenborough only, in the Port of London in the years 1860, 1870, 1880, 1890, and 1899. (See Appendix, 3rd day, No. 2.) (3) A return of the number and tonnage of vessels entering the Port of London (exclusive of Queenborough) in 1899, distinguishing the particular dock, wharf, pier, or mooring, at which entered. (See Appendix, 3rd day, No. 2.)

Recalled 11547.

Mr. HENRY CHARLES BAGGALLAY called and examined.

771. (Chairman.) How long have you been engineer to the London and India Docks Joint Committee?—Three years. I am not their engineer now. I resigned a year ago, but since then I have been consulted by them, and am carrying out works for them.

772. You are a consulting engineer?—I have not an official position as consulting engineer, but I was their chief engineer, and now I am carrying out works for them. Your Lordship asked last Thursday that I should give evidence as to the physical condition of the various docks under the control of the Joint Committee. I propose to give to the Commission a description of the various docks, which will be in effect an extension of the Table giving particulars of the Docks, which was handed in by Mr. Scott on Thursday last (see Appendix, 2nd day, No. 7), and I would ask the Commission at the same time to look at the plans of the docks as I go through them in detail.

(The Witness handed in plans of the following docks: Tilbury, Royal Victoria and Albert, East and West India, London, and St. Katharine.)

Before describing the different docks one by one, as I propose to do, I think it will be useful if I explain what the figures I am about to give regarding the levels in the river and docks mean. We refer everything at the docks to Trinity High Water, which is an arbitrary level 12ft. above ordnance datum. High water at spring tides is generally about 12in. above Trinity. High water at neap tides is generally 3ft. 6in. below Trinity. On very rare occasions is it as much as 5ft. below Trinity.

773. (Sir Robert Giffen.) What do you mean by ordnance datum?—Ordnance datum is what is put on all Government ordnance plans.

774. (Sir John Wolfe-Barry.) The datum of the ordnance maps?—Yes.

775. (Mr. Ellis.) And it is marked on the wall?—Yes; it refers to the old dock sill at Liverpool. I think.

which is the mean tide level. Taking average tides through springs and neaps, I found the average level of the water in the river at the Albert Dock at high water to be 9in. below Trinity—that is to say, taking an average of all the tides, springs and neaps. At one hour before or after high water 2ft. below Trinity.

776. (Sir John Wolfe-Barry.) Is that an average tide or a spring tide?—An average tide. At 2 hours before or after high water, 5ft. below Trinity; at 3 hours before or after high water, 9ft. below Trinity; at 4 hours before or after high water, 14ft. below Trinity; at 5 hours before or after high water, 18ft. below Trinity; at low water, 19 feet below Trinity. I may add that these figures which I have given are the average, but as a rule there are only four tides at neaps that do not reach within 2ft. at Trinity, and there are eleven tides which reach Trinity, or go above it. Therefore this 3ft. 6in. or 4ft. below at neaps only occurs on a certain number of days, not very many, at dead neaps.

777. Could you give us an ordinary spring tide and an ordinary neap tide, and an extremely high spring tide and an extremely low neap tide?—Yes. As you know, in November it is sometimes influenced when we have enormous floods. We have one mark very nearly 5ft. above Trinity, but an extremely high spring tide would be 18in. above Trinity, and an extremely low neap tide would be 4ft. below Trinity. They do not often go more than 3ft. 6in.

778. Now will you give us the low water for those tides?—The low water for those tides would be at springs 21ft., and at neaps about 18ft. or 19ft.

779. Below Trinity?—Yes, below Trinity. In giving therefore the levels on the sills I assume, to be on the safe side, a neap tide to be 4ft. below Trinity, and ordinary low water to be 20ft. below Trinity. Of course in the River Thames exceptionally high and low tides occasionally occur, owing to strong winds or to floods coming down from the upper reaches. The outer sills are much deeper than the inner sills in most of the docks. In pumped docks there are no neaps, because we pump

the water up to the Trinity level, but the outer sills have to suffer the difference in level between springs and neaps.

780. (Chairman.) How do you pump the water—from the river?—Yes, from the river.

781. That is so as to keep a uniform depth within your docks?—Yes, which of course affects the inner sill of a dock. In the case of a dock like Tilbury the water in the Dock gradually goes down to neap water level, whereas a dock that is pumped is always maintained at spring level, so that in that case the outer sill really only influences the number of hours in which there is water enough for a ship to get into the dock.

782. At what time of the tide do you open your lock gates?—That entirely depends on the ship that is coming in. If a small ship had to go in we will say to the Albert Dock, where there is deep water, she might come in three or four hours before or after high water; but if a ship that was drawing 27ft. to 28ft. wanted to come in she could only come in, we will say, two hours before, or two hours after, when the water is not more than 5ft. below Trinity.

783. Then you have to keep your lock gates shut during the greater portion of the time?—For ships, but not for barges.

784. You have constantly to open them for barges?—Yes.

785. And you lose water consequently upon that?—Yes.

786. The effect of the lighters you must tell us about afterwards?—Yes; that is in the other part of my evidence. Tilbury, which is the most modern dock, was commenced in 1882, and completed in 1886. It is distant 26 miles by water from London Bridge, and by rail from Fenchurch-street 22 miles. The total area of the property, including the water area, is 583 acres, as shown in green and yellow on the plan which is before the Commissioners. These colours have no force now. They were the division between the company's property and the Committee's control. The land coloured green is well adapted for dock extension. The dock, which consists of a main dock and three branches, has a water area of about 53 acres. It is entered by a lock leading from an outer tidal basin of 20 acres, protected by timber jetties projecting into the river. Opposite the entrance the depth of water in the centre of the river at low water is 45ft., and there is a depth of about 27ft. in the river at the entrance to the basin. The basin is 25ft. deep at low water, 45ft. at high water springs, and 41ft. at high water neaps. I may mention that there is more water on the Kent side than in the centre of the river, but I have to deal with the centre of the river where the ships have to go. And also there is less water lower down, but that has nothing to do with this particular instance. The lock from the basin into the dock is 700ft. long, with three pairs of gates, and is divided into lengths of 150ft. and 550ft. That is done partly for safety, and partly not to use a whole lockful of water for a short vessel. The breadth is 80ft. The outer and middle sills are 44ft. below Trinity, giving 40ft. at high-water neaps. The inner sill is 38ft., giving 34ft. at high-water neaps. In case of accident to the lock, the traffic could be passed through the graving docks which connect the basin with the dock. They are shown on the east side of the lock. I believe that the "Oceanic" is the largest ship afloat. She is 686ft. in length, with 69ft. beam. She could therefore enter the Tilbury Dock at the very lowest of neap tides, as I believe she is never loaded down to draw more than 33ft. She trades with Liverpool, where the newest dock entrances only give about 30ft. at high-water neap tides. But of course London is at a disadvantage with many other ports in this respect. If a ship arrives at a dock where the river is deep, she can lighten in the river or wait there till she can get in. If you have a bad tide, very often the following tide is a foot or two more. She can lighten in the river, but that cannot be done anywhere in the London docks except at Tilbury. It could not be done at any of the other docks, because the depth of the river would not allow a ship to be afloat at low water. The main dock is 1,820ft. long by 600ft. wide. The centre branch dock is in a direct line with the lock. It is 1,600ft. long, with a width of 300ft. The eastern and western branch docks on either side of it have a similar length, but their width

tapers from 300ft. at the main dock end to 200ft. at the far end, instead of the quay walls being parallel, as is the case in the central branch. These branch docks and the main dock are all 38ft. below Trinity, which gives 34ft. at ordinary neap tides. Occasionally, locking reduces this as much as 2ft. On those occasions therefore the available depth is only 32ft. The dock system is capable of accommodating at one time about 20 ships of 550 to 600ft. in length, or about 30 ships of the average size of those which come to Tilbury, the total quay length available for shipping being about 15,000 lineal feet. One of the quays of the main dock is used for coaling purposes, and is let to a private firm; another quay is let as a timber wharf, and several ship-builders rent yards on the estate. The two quays which divide the branch docks from one another are 1,600ft. long by 380ft. wide. Sheds 300ft. long by 120ft. wide are placed along the quays in the branch docks, and are set back 32ft. from the water edge. The tidal basin is also furnished with quays and sheds, and it is used for a certain class of transshipment business and passenger traffic. This dock was built on marsh land, and it was therefore quite impossible when it was constructed to pave the quays with any chance of the pavement standing. They were therefore only ballasted; but recently the Joint Committee have been putting down concrete paving, which, it is expected, will stand now that the ground has had time to consolidate. For the same reason the floors of the sheds were made of timber. This, as the timber decays, is gradually being replaced by concrete. There is no doubt that at first considerable inconvenience was caused owing to the irregularity of the surface of the quays, and the sinking of the floors of the sheds; but it was quite unavoidable, and the time has now come when the dock company is able to make, and is gradually making, a more permanent surface suitable for trucking. The quay walls are built of concrete faced with brickwork. The sheds are of a substantial kind, with boarded and slated roofs, and are provided with roller shutters for their whole length, so that trucking in and out can take place at any part of the sheds. The floors of the sheds are level with the quays on the Dock side, but at the back the rails are laid at a lower level to facilitate loading into trucks. There are 24 of these sheds in the branch docks and three in the basin, with a total floor area of nearly 1,000,000 square feet. Thus, taking the number of ships in the dock to be 27, each ship can be accommodated with a shed floor area of 36,000 square feet. These sheds are all single floor sheds. It would have been exceedingly expensive to have had double floor sheds. On account of the foundations being so bad there they would have had to be on piles. There is another reason why double floor sheds were not put there. They would not be required so much there as at some of the other docks, because such a large quantity of cargo goes over the side into barges, that the same accommodation is not necessary there as would have been the case had all the cargo had to go on to the quays. A double line of rails runs down the quays, and also several lines of rail at the back of the sheds, so that the cargoes can be disposed of with great rapidity. There is ample provision of sidings, also of sorting sidings, the total length of rails within the dock boundary being 26 miles. The shunting of the wagons is done by five locomotives, one of which has been only recently added. I ought to mention that the rails are connected with the London, Tilbury, and Southend Railway which runs to Fenchurch Street. There are two graving docks each 846 feet in length. One has a width of 70 feet at floor level, and the other 61 feet 6 inches. The sill of the larger one is 35 feet below Trinity and of the smaller 30 feet. The width of the entrances at sill level is 70 feet for the larger and 60 feet for the smaller, but at water level at the basin end, the width is 7 feet more in each case. Each of these graving docks can be divided by caissons into two shorter docks. There are several grooves in the sides of the dock so that different lengths can be given. One portion can be entered from the basin, while the other portion can be entered from the main dock, or the whole can be used as one graving dock entered from either end. The pumping engines for the graving docks have an indicated horsepower of 908. These can empty the larger dock in four hours, and when shortened by the caisson and with a ship in the dock the pumps can empty it in two hours. The Tilbury Dock is furnished with 62 movable hydraulic cranes (of which some have been delivered since June last) having a lifting power of 30 cwt. Hydraulic power is supplied to these cranes.

also to capstans, and to the machinery for working the gates, by three pairs of engines of a total indicated horse power of 600. In addition to the hydraulic travelling cranes there is a floating steam derrick capable of lifting 30 tons at a radius of 27 feet. I ought to explain that being on a barge she could only reach over a ship 18 feet 6 inches. There are also two steam portable cranes. On the east side of the graving docks a large number of workmen's dwellings, cottages for foremen, and houses for officers have been provided. There are also a large hotel and restaurants belonging to the Docks Company. The tidal basin collects a great deal of mud, which is driven out again by a "blower." A "blower" is a small tug with pumping engines on board which pump water at considerable pressure through a tube to a sort of rake. This latter is hauled over the surface of the mud, and stirs it up so that the tidal current may carry it away. The Joint Committee have three of these "blowers" and one drag. A "drag" is a tug fitted with a rake, but without the pumping arrangement. The blowers are used for dispersing the mud at the entrances and preventing it from forming bars. They are also used for removing the mud from the locks and from the inner basins near the locks. They stir up the mud, and as the gate sluices are opened it passes out. This is only done at spring tides, when the water used can be replaced without cost. The blower at Tilbury is also furnished with fire engines and salvage pumps. There are 17 tugs altogether at the various docks, but only three are fitted up as blowers and one as a drag. Ten of these tugs have fire engines on board. The dredging is done with single ladder dredgers, of which there are two in commission, and one grab dredger. There are two other ladder dredgers, but they have not been used lately, as they are only suitable for the smaller docks, and it is found more economical to hire a dredger when extra work is required than to keep them in commission. As locking is carried on at all hours at Tilbury, some of the mud stirred up by the blower must enter the dock and increase the quantity to be removed by the dredgers. The quantity of mud that accumulates at Tilbury is so great that the average annual dredging for the last three years has amounted to no less than 3,740 tons per acre. The average quantity removed from the Tilbury Dock per annum is 187,000 tons. In earlier years it was greater still, but recently, owing to stricter regulations as to locking, the loss of water has not been so great per tide. The average cost of dredging at Tilbury for the last three years being over £9,200, and the number of berths in the dock being 24, the proportion of the dredging expenses that should be attributable to each berth is about £390. In former years it was as high as £500 per berth. This dock is in direct railway communication with the Commercial Road warehouses and railway depôt, where the floor area of the warehouses amounts to 360,000 square feet. Goods trains run daily between the depôt and the dock. There are no warehouses at Tilbury, because there is no demand for them, the exigencies of trade requiring the goods to be stored as near the centre of commerce as possible. Goods are therefore sent up by rail or water to uptown warehouses. Some goods are, however, warehoused at Tilbury in the sheds, which are quite suited to warehousing requirements, as they are closed sheds, and of a solid construction. Although these buildings are termed sheds they must not be confounded with ordinary open shelters.

787. (*Mr. Ellis.*) Before you leave that may I ask one question about railway access. You have mentioned the London, Tilbury, and Southend Railway as the line with which you have connection. Have any other railways running powers over that line?—I am afraid I am not able to answer that question. That is the only railway we have got contact with.

788. That is the only railway company you know?—The solicitor informs me that all the other companies have running powers over that railway.

789. By "all the other companies" you mean the northern lines—the Great Northern, Midland, London and North Western, and so on?—Yes.

790. (*Chairman.*) Will you tell us, as you have no warehouses at Tilbury, what proportion of the goods are lightered and what are sent by rail or road?—I cannot answer those questions.

791. Those are physical questions; they are not commercial questions. They are questions which relate to the physical use of the docks, they do not raise questions of policy?—But the Chairman proposes to give that evidence.

792. (*Sir John Wolfe-Barry.*) To whom do the locomotives belong?—To the Joint Committee of the Dock Companies. *Mr. H. C. Baggallay.*

793. Do they take the terminal upon all goods, do you know?—I do not know that. 13 Nov. 1900.

794. What is the absolute available depth in the entrance basin. Are you able to maintain it at the depth on the sill?—With great difficulty. We have a blower there, and we do maintain it, but it is only by constantly having the blower at work and occasionally sending a dredger down to assist.

795. By those means you are able to keep the depth on the sill available in the basin?—Yes.

796. With regard to the matter of cost, £9,200, is that the cost inside the dock or does it include the cost of the basin?—It would include the cost of the basin.

797. Is the water of the river more muddy at Tilbury than opposite the Victoria Dock?—I do not think so. I think it is owing to the way in which the dock has to be worked. Locking takes place at all states of the tide owing to the river being deep, and when the lock is filled and then reduced to low water there is something like 7,000,000 gallons of water that passes out; that reduces the level of the water in the whole dock 6 inches, and therefore the incoming water brings in its mud in far greater quantities than in docks where locking is practically confined to the hours when the water is higher.

798. Then would you think that if you pumped up Tilbury Dock you would reduce the amount of mud inside?—Not unless the hours at which barges went in and out were restricted. The mere fact of pumping the water in does not alter the quantity of mud. We find exactly the same quantity of mud in water pumped in as comes in with the tide.

799. Do not you find the quantity of mud in the river much less at one time of the tidal flow than at others?—Yes, it does vary very much, but where we pump we have unfortunately to pump so many hours that we have to take it in all its states.

800. (*Chairman.*) Is this tidal basin the best way of entering large docks like this?—No, I cannot say that it is.

801. If you were constructing the works over again would you have a different entrance?—Certainly, on account of the mud. That basin would have been all right if there had been no mud, but with the mud it is very awkward. We have to keep a blower always at work to keep it clear.

802. Is it always open to the river?—Always open.

803. Would it be very expensive to make any alteration to avoid that?—I am afraid it would, and the direction of the entrance is not very good for making it straight on to the river. For locking purposes it is very desirable—that is to say if you want ships to come in at different states of the tide—that the entrance should point up the stream. The upper docks are nearly all at right angles to the stream, but ships, on account of the depth of water in the river, are obliged to come in at the top of the tide, when there is no current, and therefore they come in at right angles. You could hardly lock in at Tilbury unless it was high water, and unless the tide was more or less quiescent.

804. Then are the docks at a wrong angle now?—They would be if we removed the basin.

805. Are they at a wrong angle now?—Not now.

806. But they would be if it was open to the river?—Yes, if you did away with the basin.

807. Is there any proposal to make docks alongside, of a different opening and a different construction?—Yes, quite different—pointing up the river. Plans have been before the Committee, and they have been considering them for some time.

808. In what way would they be different?—Instead of being short docks like these they would run right up to the top, and the entrance would be a continuation of the main dock, so that it would point up stream.

809. In the opposite direction, in fact?—Yes, pointing up stream.

810. Is that a convenient place for the extension of docks in London?—No, I think not, as a first

Mr. H. C.  
Baggallay.

12 Nov. 1900.

extension. They ought not to be extended there until the site near the Albert Dock is utilised.

811. Then there would not be a sufficient number of ships to justify your making the docks here?—Certainly not, at present. I understand that no ships go in at Tilbury if they can possibly get in higher up, and it is proposed to make much deeper entrances and deeper docks at the Albert Dock. There is certainly room for extension there.

812. Then you find the distance from London a drawback to the dock, in fact?—Yes.

813. Except for certain purposes?—Except for certain purposes.

814. It does not matter, I suppose, for passenger purposes much?—No, I presume not.

815. (*Sir Robert Giffen.*) Can you indicate what kind of goods are warehoused in the sheds at Tilbury?—I am afraid I cannot speak on those subjects at all. I am only an engineer.

816. (*Rear-Admiral Hext.*) In using the graving docks, which entrance do you generally use?—The basin.

817. From the basin or the dock itself?—From the main dock as a rule.

818. (*Chairman.*) Now will you go on to the next docks?—Proceeding up the river the next docks are the Royal Victoria and Albert Docks. The Victoria Dock was commenced in 1850 and completed in 1855, and the Royal Albert Dock was commenced in 1875 and finished in 1880. The total area of this property is about 702 acres, of which the water area is about 177 acres, the two docks practically forming one continuous dock, as they are connected by a canal in which there are no gates. Along the north bank of the river there is a wharf stretching 1,100ft. down the Thames from the lower Albert Dock entrance, having a depth alongside of 27ft. at low water, and a breadth of 50ft., with a railway station abutting on it. The railway lines are continued along this wharf, and the largest vessels are able to lie there at any time of tide to coal or take in cargo or disembark passengers. Coasters and Continental steamers are able to avail themselves of it in connection with the ocean steamers or otherwise. There are two entrances to the Royal Albert Dock at Galleons, which is 11 miles by water from London Bridge, and one entrance to the Victoria Dock, which is about 7 miles by water from London Bridge. The depth of water at Galleons in the centre of the river at low water is 20ft. shoaling to about 12ft. at the pierheads in front of the entrances. Although there is 20ft. opposite the entrances, there is less water a little way lower down. These two entrances at Galleons are both 550ft. in length by 80ft. in width; they each have three pairs of gates, the middle pair in each case being 150ft. from the inner pair. The new or down stream entrance was constructed in 1886, as the old entrance alone was found to be inadequate for the growing traffic of ships and barges, and did not give sufficient depth of water for the increasing draught of ships. It has a depth of 36ft. on all three sills at Trinity high water, or 32ft. at high water neaps. The upper or older entrance has 30ft. on all three sills. The invert in the locks are curved, and therefore at the extreme edges of the lock, which is 80ft. wide, there is 18in. less depth, but with that width of lock there is not more than the curvature of even what is called a square ship would amount to. The entrance from the river to the Victoria Dock is 325ft. in length, 80ft. wide, with 28ft. on the outer and 25ft. 6in. on the inner sill; the depth of water in the centre of the river here is about 13ft. at low water, shoaling to about 8ft. at the entrance to the dock, giving about 29ft. at high water spring tides, and 25ft. at neap tides. The canal at the inner or dock side of the lock is crossed by a swing bridge carrying a line of rails and a public road.

819. (*Sir John Wolfe-Barry.*) Are those depths at low water in the river, spring tide low water?—They are at the fixed Admiralty Chart level. At this particular point, 21ft. below Trinity is taken. There are various depths on the Admiralty chart between London Bridge and the mouth of the river, and the depth I have given you is at what is called low water on the Admiralty chart.

820. It is usually the spring tides on the Admiralty charts—almost invariably?—Yes. Nearly all the ships for this system of docks enter by the new Galleons

lock. The old lock at Galleons and the Victoria entrance are almost exclusively used by barges and small craft. The water in the Victoria and Albert Docks is maintained at a level of Trinity high water—giving a depth of 32ft. in the Albert Basin; 27ft. in the Albert Dock; and 25ft. 6in. in the Victoria Dock and Basin. This is effected by powerful pumping engines situated at the Galleons entrance. Therefore, at the Victoria Dock the inner sill is higher than the outer sill, but if once a ship can get into the lock, you can get the full depth of spring tide on the inner sill, and not have to deduct the 4ft., which we have to do on the outer sill. The Albert Dock Basin has a present area of 15½ acres, having been increased from its former area of 13 acres in 1886, when the new entrance was made. It is surrounded by quay walls capable of accommodating six of the deepest ships. The average length of the ships there is 450ft., whereas we can take in through the locks ships up to 536ft. It would take six ships of 450ft. average length; it has all the requisite sheds, appliances, and railway connections, and is connected with the main dock by a passage crossed by a public road swing bridge. This passage is 80ft. in width, and is furnished with a pair of gates, the depth on the sill being 27ft. 3in. Vessels up to a draught of 30ft., therefore, which cannot enter the Albert Dock, are able to discharge at the quays in the basin. It is a very common practice that when a ship wants to load down to more than 27ft. 3in., or a little over (we can generally get the water a little above Trinity) she completes her loading in the basin, so as to avoid the difficulty of getting out fully loaded.

821. What is the object of having a different depth in two docks which communicate with each other?—When the dock was originally built, I presume they intended to use the basin (which was the old custom) more as a big lock. You will find that all basins are made much deeper than the dock, because a loaded vessel when she is coming in, if she is too deep, has to discharge part of her cargo before going into the dock. That is done, in other ports, in the river; but in London they cannot lie in the river, because there is no water for them.

822. It is rather a makeshift sort of business?—Except that at some docks the basins have quays and sheds exactly like the dock.

823. But suppose you have a certain number of vessels drawing over 27ft. 3in. of water; that basin would not hold them?—No.

824. And the tendency is to have vessels drawing over 27ft. 3in.?—That is so; and the intention is that, if extensions are made at the Albert Dock, as proposed, a cut shall be made from the old dock, so that ships can get in without passing over the sill.

825. What would be the expense of deepening the Albert Dock?—I think it would not be a very costly matter. It could be done by putting a false quay in front of the walls, say 10 or 15 feet wide, as has been done in some of the other docks, and then dredge deeper. You would make a timber staging with concrete and ironwork superstructure, and it could be easily lowered a few feet. There will be a cut from the new extension, probably from 36ft. to 39ft. deep, to go into the old dock.

826. (*Sir John Wolfe-Barry.*) Has that ever been proposed by the board of directors?—I have prepared plans with that object.

827. By their instructions?—By their instructions.

828. (*Chairman.*) The property coloured white on this plan does not belong to them?—No; that is town. It is only what is coloured green that belongs to us.

829. Where would they enter, according to your proposal?—(*The Witness pointed out the position on the plan.*) The proposal is to buy a strip of land on the south side, which is not built over.

830. You would have room enough with the purchase of a little extra land on the south side?—Just a strip more land will give sufficient width. I think the Chairman will probably tell you what his ideas about extensions are when he gives evidence.

831. Do you say you have made plans, or that you have considered the expense of such an alteration?—Yes, I have.

832. That you can give us, I suppose?—Yes, to make an extension on the south side of the Albert Dock for 20 ships of an average length of 500ft., which

is the average length of all ships over 7,000 tons that have been built during the last ten years, with a cut into the Albert Dock, a graving dock 700ft. long, with 30ft. on the sill, an entrance lock 750ft. long, with 38ft. on the outer sill and 34ft. on the inner sill—to make a dock of an average depth of 36ft., with 39ft. at the entrance end to catch the mud, would cost, without sheds, but with all other expenses, like rails and everything else, exactly one million pounds, including the land. The sheds that are proposed would cost about £350,000, but the question of how they should be made has not been settled yet. There are so many different ideas as to what is required nowadays that it is a big question; but the sheds would cost about £350,000, in addition to the million, which includes the dock, the lock, the graving dock, the cut, and the rails.

833. Would you consider that a cheap dock for the accommodation which it affords?—I should say very cheap.

834. Cheaper than it could be made at any other part of the river, are you prepared to say?—Yes, I should think so. One point is that the dock company has already so much of the land required, and it would be so much more economical to work it there, because there would be the same staff and the rails.

835. How long has that plan been considered?—I was first consulted on the subject about two years ago, but it has gradually got more matured lately. In fact, the board approves my plan for the Albert Dock. They have not yet approved the one for Tilbury, but I do not suppose the Tilbury one would come on until they had settled the question of the Albert Dock.

836. Would that estimate include the fitting up with hydraulic cranes, and everything necessary for the purpose?—Yes, complete.

837. And all done in the best and most substantial manner?—Yes.

838. All solid?—Yes, it would be almost entirely of concrete, which is the cheapest material that can be used now for dock purposes. I have some hesitancy in saying what the Committee propose to-day about extension, because I believe it depends to some extent upon their funds, which I am not competent to speak of.

839. We do not want you to go into that. We only want to know what your estimates are. Now, will you go on with your narrative?—The Albert Dock itself has a water area of 72 acres. It is 6,500ft. in length, with a breadth of 490ft., and can accommodate 28 ships of an average length of 400ft. Each berth is provided with a shed 320ft. in length and 120ft. in width, giving an average area of 38,400 square feet to each berth. The quay between the sheds and the water is 40ft. wide on the north side and 50ft. wide on the south side, and there are two lines of railway running down the whole length between the sheds and the dock side. Rails are also laid down the quays for the travelling cranes. At the back of the sheds there is a minimum of three continuous lines of rails, with numerous additional sidings. There is also a very complete system of sorting sidings on the north side of the Victoria Dock. These two docks are connected directly by rail with the East Smithfield depot, near the London Dock. This is the depot for the receipt of all goods to be sent to these docks by rail. Numerous goods trains run daily between the depot and the docks, occupying about twenty minutes in transit. The total railway mileage in the Victoria and Albert Dock system amounts to 45 miles. The proximity of the Victoria and Albert Docks to London causes a large proportion of goods to be conveyed by cart and van direct to their destination. On account of the Albert Dock having been built on marshy land the quays were originally planked with timber, because the ground was not sufficiently consolidated to bear concrete or any more solid form of paving, but during the last few years 21 out of the 28 berths have been laid with concrete. Between the Albert and the Victoria Docks there is a passage way 80ft. wide and 25ft. 6in. deep. This depth cannot be increased, as there is a railway tunnel beneath for the Great Eastern Railway line. There is also a railway and public road swing bridge over the passage. I mention all these bridges over, because, having to open so many swing public road bridges is sometimes a great factor in the delay at the docks. The Victoria Dock has a width of 1,000ft. On the north side there are eight jetties, which are available as well as the quay-side for the accommodation of vessels. On the south side berths are provided by

a timber quay with concrete flooring. All these jetties and quays are supplied with sheds. The dock is connected with a basin, which has an area of 16 acres, by a passage having a width of 80ft. and a depth of 25ft. 6in. The dock and basin together have quay berths for 27 ships, and have a total water area of 90 acres. There is, in addition, ample accommodation in this dock for ships to lie up. Lines of rails run all round the dock behind the sheds. On the south side of the dock there is a basin or pool covering 11 acres, formerly known as the Victoria Graving Dock, and purchased a few years ago from the Victoria Graving Dock Company. This, together with some of the adjoining land, has recently been let to the London Grain Elevator Company, who have erected four large grain elevators, on the American principle, to facilitate the handling of grain. In addition to the shed accommodation there are large warehouses for tobacco built on the north side of the Victoria Dock, also large granaries of four floors on the north-east side. On the south side are large timber structures for warehousing grain and other goods. The sheds, warehouses, and granaries in the Victoria and Albert Docks together have a floor area of no less than 3,360,000 square feet. There are also 36 refrigerating chambers provided with the necessary machinery and appliances for storing 364,744 refrigerated sheep. Where new sheds have been put up of late years they have been made with two floors. All the old sheds at Tilbury, and also at Albert Dock, were single-floor sheds, but recently two sheds have been put up on the south side of the Victoria Dock and another on the north side of Victoria Dock, which are double-floor sheds. It would have been very expensive at first to put up double-floor sheds in the Albert Dock, because there would have had to have been so much piling, owing to the marshy ground. The railway companies run trains direct from these refrigerating chambers—

840. (Mr. Ellis.) Do you mind saying what railway companies? Just give us the names?—All railway companies.

841. Not all railway companies. You mean all the northern lines, surely?—Yes, all the northern lines. All the railway companies run trains direct to the sorting sidings in these docks, and their trucks are taken by the Joint Committee to and from the sheds and berths. At the west end of the Albert Dock there are two graving docks. The larger is 502ft. in length, 62ft. wide at the floor, and 85ft. wide at the coping level, the width of entrance being 59ft. at sill level, and 68ft. at water level. The sill is 22ft. below Trinity, and the floor level 3ft. lower. This dock can be pumped out in about 2½ hours when there is a ship in it. The smaller dock, which can be pumped out in about 1½ hours, is 410ft. in length, 77ft. wide at the coping level, 54ft. wide on the floor, and 52ft. wide on the sill which is 22ft. below water level and 65ft. wide at water level. With the exception of the graving dock in the Blackwall Basin, which is let to the West India Dock Graving Company, the graving docks in the Albert and Tilbury Docks are the only graving docks belonging to the Joint Committee. Although it involves a little departure from the plan of dealing with each system of docks separately, I think it will be convenient for me to explain the reasons for this fact here. First, at the time the older docks were built there were Acts of Parliament expressly forbidding the building of graving docks by the dock companies, and the practice of building or repairing ships. These Acts governed the London and India Companies respectively during the whole of their earlier history, until the space round the docks which might have been available for graving docks had been devoted to other purposes. The sections applicable to the London Dock and the India Docks respectively are as follows:—The London Dock Act, 1800, 39 and 40 George III. Cap. 47, Section 26: "Provided always and be it enacted that no slip or slips dry dock graving dock way or other place for the building or heaving down or repairing of ships or other vessels shall at any time hereafter be made or built or permitted or suffered to be made or built in or adjoining to any of the said docks hereby authorised to be made or of the basins and cuts which shall belong thereto nor shall the said London Dock Company at any time or times carry on or be in anywise concerned in the trade or business of building or repairing ships or other vessels for hire or profit." The West India Dock Act, 1831, 1 and 2 William IV., Cap. 52, Section 141: "And be it further enacted that it shall not be lawful for the said West India Dock Company at any time or times to carry on or be in anywise concerned in the trade or business of building or repairing ships or other vessels for hire or profit nor

Mr. H. C.  
Baggallay.

Mr. H. C.  
Baggallay.

13 Nov. 1900.

shall any slip or slips dry dock graving dock way or other place for the building heaving down or repairing of ships or other vessels at any time hereafter be made or built or permitted or suffered to be made or built in or adjoining any of the said docks basins and cuts of the said company but nothing herein contained shall extend to prevent the said company from selling or letting the docks yards and other premises at Limehouse now in the occupation of Messieurs Fletcher Son and Fearnall, nor the docks yards and premises at Blackwall now in the occupation of Messieurs H. and W. Pitcher but so nevertheless that no opening or communication shall be made or permitted between the docks cuts and basins of the said company and the said docks yards and premises now in the occupation of Messieurs Fletcher Son and Fearnall and Messieurs H. and W. Pitcher so long as those docks yards and premises shall be used for the purpose of building or repairing ships or other vessels." The above section of the London Dock Act was not repealed until the London and St. Katharine Docks Act, 1864. The section of the West India Dock Act was incorporated in the East and West India Dock Act, 1838, and is still applicable to the East and West India Docks. Secondly, it has up to the present time been unnecessary to build more graving docks than those already referred to because there are in the river Thames sufficient private graving docks to meet the requirements of the Port, but in any future extension of the Albert Dock, the Dock Company propose to make a new graving dock capable of accommodating the largest class of vessel. There are in these docks 121 travelling cranes, exclusive of a certain proportion of 24 new cranes recently delivered and on order. There are also 96 fixed cranes and jiggers, and two floating cranes, one capable of lifting 50 tons at 51 feet 6 inches radius, and the other 30 tons at 47 feet radius. The larger one would only have an effective radius of 34 feet and the smaller one 24 feet 6 inches clear of the barge. The number of cranes in the Albert Dock are quite sufficient for the work. I have made a point now for more than two years of always noticing the number of cranes in the Albert Dock when I have been there, and I have never yet seen more than half of them at work. The reason that complaints are sometimes made that there are not cranes enough is the difficulty of moving the cranes quickly from one point to another when the quays are blocked up by the cargo from other vessels. In most ports where cranes are used, they are hired more or less for the whole time the ship is loading or discharging; but in London, where such an enormous proportion of the goods go over the side, ships do nearly all their business into barges, and then suddenly require cranes for every hatchway on the ship. Therefore, when a ship is about a fortnight at the quay, instead of, as would naturally be expected, taking a number of cranes, she probably does not require them for ten days, and then she requires a large number for two or three days. In fact, I calculated a short time ago that the cranes do not earn even interest on their own cost. Hydraulic power is laid on to all parts of the Docks with two pumping stations. The four largest steam tugs are fitted with steam fire engines, and fire hydrants and engines are provided along the quays. These docks are illuminated with electric light supplied from an installation at the Victoria Dock. There are 17 locomotives for shunting wagons on the various sidings in the Docks, and there is also a passenger railway on the north side belonging to the Joint Committee, but worked by the Great Eastern Railway Company. There are stations at different points all down the Docks.

842. (*Chairman.*) Do the locomotives belong to the Joint Committee?—Yes. A ferry is maintained across the Albert Dock near its centre. That is a steam ferry. Large quantities of mud enter the Victoria and Albert Docks. It is found that on an average based on the returns of the last three years the quantity to be removed by dredging amounts to nearly 1,600 tons per acre of water space. I have already mentioned that the dredging per acre of water at Tilbury amounts to 3,740 tons per acre of water space; at these docks it is 1,600 tons per acre. The quantity of mud dredged at the Victoria and Albert Docks during the past three years amounts to an average of 280,000 tons per annum. The plan of the Albert Dock is very convenient, and could hardly be improved upon. It will be noticed that the quays are of great length, and straight, so that the various berths can be divided from time to time into suitable divisions for any length of ship. In regard to depth, some ships are now being built too deep for this dock, but the Dock Company intend in any future extension

that the depth shall be 36ft. The two entrances at Galleons are almost at right angles to the river, but no difficulty is experienced in locking the longest vessels that can come to the dock as the jetties or timber piers are carried well out into the river. The depth of the water at the new Galleons entrance on the sill is sufficient to pass any ship that in the present state of the river can come up so high, as the sill is deeper than the bed of the river. At many ports similarly situated ships when unable to enter the docks at neap tides are able to lie off the entrance and there be lightened by discharging a part of their cargo. This cannot be done in the Port of London, except at Tilbury, where it is never necessary.

843. If the Thames were deepened throughout to 30 feet as far as this point, would that assist the docks?—Very materially, because, although ships can, on the top of the tide, come up now, it would be a very great advantage if they could remain in the river a longer time. Now they have just time to get up on the top of the tide and go in. It would be very much safer, and would avoid a good deal of risk, if they were not afraid of being caught if they were a little bit late.

844. And you would find that the ships that want 30 feet of water would come in there if the river was deepened, in preference to going to Tilbury?—Yes.

845. For many reasons?—Yes, for many reasons.

846. (*Sir John Wolfe-Barry.*) If a ship is caught by fog between Gravesend and the Victoria Docks, she is in a very awkward position, is she not?—Yes, she is in a very dangerous position.

847. She may not be able to work backwards and forwards?—That is so. I remember once two ships on two different occasions trying to get into a dock and something went wrong, and one of them fell back and had to be beached further down. Besides that there is the time. Although if you work out the number of ships in each dock in the course of a year it will only come to a very few per day, still it may happen that six or seven will come on one day. Of course, they would be very much pinched for time, and if anything happened to one of them, with others behind, the others would have to drop down stream as quickly as they could with the falling tide.

848. (*Chairman.*) There is rather a rush of vessels at certain times, I suppose, instead of having them distributed evenly during the year?—Yes.

849. (*Sir John Wolfe-Barry.*) How much land would be required over and above what you have now got?—Do you mean for the extension of the Albert?

850. Yes?—45 acres.

851. You would have to purchase 45 acres?—Yes.

852. Would that be all the land available which is not built upon?—No. It would be all that we should require.

853. Would other land remain unbuilt upon?—Yes, a considerable area would remain unbuilt upon.

854. Can you give us an idea how much land would remain which would be suitable for dock extension?—I do not think you can extend practically the docks any further down on that side.

855. No further southwards?—No, because at one part we come just on to the margin where they are building, and although there would be a large number of acres left it would not be sufficiently wide to make a third dock, as it were.

856. These plans which you have put in do not show the building land?—No.

857. Do you find that there are many ships now that approach 30 feet draught of water?—No.

858. Do you know what your dockmasters demand in the way of water under the keel when coming over the sill?—They generally say 6 inches.

859. Do they run it as fine as 6 inches?—Yes. We know they do run it as fine as that, because they sometimes cut the chains of the gates at the bottom, and they do not stand up more than 3 inches or 4 inches.

860. I was just going to ask you are your sills diminished in depth by a chain?—Yes. That could soon be got over, because in our new gates we have put hydraulic rams instead of chains. In the South-West India Dock I am carrying the chains down. You know the system?

861. Yes, to avoid going on to the sill?—Yes.

See  
643-650

862. You heard Mr. Cater Scott saying that he could take into the Albert Docks all the biggest ships that have been built. He gave us a list?—All except 30.

863. He mentioned the "Oceanic" and the "Iu-cania"?—The 30 that would not go in are over 536 feet in length. We cannot take anything more than 536 feet in length into the Albert Dock.

864. Because of the lock?—Yes. The lock is only 550 feet, and you want about 12 feet clear.

865. For the gates to move?—Yes.

866. Therefore they cannot take in any of those large ships that were mentioned?—No, they cannot take those in.

867. I understood Mr. Cater Scott to say they could take them into the Albert Dock?—No, Tilbury. He said: "Only 18 English and 9 foreign ships out of the above 120 are over 536 feet in length." I think there are about 30 ships afloat that could not get in as regards length.

868. These large ships could not be taken in without an alteration and a new entrance?—No.

869. Is it the experience at the Albert Docks that the sheds are wide enough for all purposes?—Yes, I should say that they are too wide. Of course the modern way is to land things on to the quay, sort them in the shed, and then pass them out at the back. I think 120 feet is quite a maximum for trucking purposes, and we would far sooner have the double-floor sheds. They were not originally built, because in the first place such a very large proportion of the cargo goes over the side that they are not necessary, and, secondly, in the first instance it would have been a very costly thing to build these double-floor sheds, because there would have had to have been so much more foundation.

870. I suppose you will agree that the great tendency of modern trade is to get the ships unloaded and away again with the greatest possible despatch?—Yes.

871. And do you consider, with the experience of the Royal Albert Dock, that the quays and sheds are wide enough for modern practice?—No, not if all the cargoes had to be landed on the quays; but the London practice is to put a certain portion over the side and a certain portion on to the quays. If it were compulsory to put all the cargoes on to the quays then the sheds would have to be extended.

872. Made wider?—Or have an upper floor. I should recommend an upper floor—not have them made wider.

873. And you say that so long as the traffic remains as it is now, and so large a proportion goes over the side into lighters, the sheds are adequate?—Yes, ample.

See 842.

874. Now, with regard to the dredging in the dock, which you gave the figures of, is that exclusively inside the dock, or do you dredge outside?—No, we never dredge outside the Albert Dock.

875. Do you give the cost of that particular dock?—I do not give it in this paper, but it is in the other evidence. I cannot give you that at the moment. I can give you the total for the docks.

See 5580

876. Perhaps afterwards you can give us your table of all the docks?—Yes.

877. Distinguishing from any dredging inside and outside?—Yes.

878. I do not know whether you heard the evidence of Mr. More as to the programme which the Thames Conservancy have set for themselves as to deepening the river?—No, I was not here.

879. The programme which the Thames Conservancy have now in view is to dredge from the Nore to Gravesend to a depth of 26ft. at low water; from Gravesend to Crayford Ness to a depth of 24ft., and from Crayford Ness to Albert Dock to a depth of 22ft. I do not know whether you are aware how much has been done towards that programme?—I fancy very little has been done. Down below Gravesend they have done a great deal of dredging, but I do not think they have done much above.

880. You are not aware of any?—I am not aware of any above.

881. What do you say as to the adequacy of the depth of 22ft. at low water for the conduct of the trade at the Albert Dock?—I do not think it is sufficient, but my opinion is that if the river was deepened very much up to the Albert Dock, it must be continued and tapered off a certain amount. I am

4238.

afraid that if we deepened the river down below and stopped suddenly at the Albert Dock, the check to the tide would be something like as at Chepstow—the tide would go up suddenly and flood the banks.

Mr. H. C.  
Baggallay.

13 Nov. 1900.

882. There is a further programme from the Albert Dock to the Millwall Dock of 18ft.?—Yes; I should think that up there it would be sufficient.

883. Then I think you told us that the depth of water at present in the centre of the river at low water is 20ft.?—At the Albert Dock.

884. At Galleons Reach?—Yes, but it is not 20ft. up to that point. The pool is 20ft. There is shoal water lower down.

885. Do you know anything at all about the number of shoals below that?—I know nothing beyond the Admiralty Chart.

886. Have you refreshed your memory with the Admiralty Chart, so that you can tell us what the limiting depth is?—Yes. Immediately opposite the Albert Dock it is 20ft. in the centre, but at either side for quite one-third of the river it is only about 14ft. or 15ft. That is rather serious, because all our big vessels swing just below the entrance. The way they enter is this. On a rising tide they swing round and then drop down stern foremost across the entrance, come against the timber jetties, and then are hauled in round the curved jetties. Therefore they require a considerable width below the dock entrance for them to swing round safely, and it is only just the very centre of the river that is 20ft. That would not allow a ship to swing.

887. The Thames Conservancy propose a width of 500ft. and a depth of 22 ft.?—That would not be sufficient, because these ships will be, we hope at any rate until we get a new entrance, 536ft., so it would hardly allow a ship to swing safely.

888. They would want something more than their length to swing safely?—Yes. Then below the entrance there are many places where there is not more than 15ft. or 16ft. right across the whole width of the river.

889. As I say, the programme of the Thames Conservancy is to make a channel 500ft. wide and 22ft. deep up to the Albert Dock?—I think the 500ft. would be wide enough until we reach the swinging place, if we widened it to enable vessels to swing.

890. Have you any idea of the depth of water the pilots allow under the keel of vessels when they go down?—I do not know at all.

891. Something must be taken off the 22ft. for safety, I suppose?—Yes, and of course in gales of wind the water runs sometimes lower or higher.

892. (Mr. Ellis.) To sum up this matter, may I take it that you wish to leave us with the impression that in your opinion as an engineer a great and continuous deepening of the channel of the Thames ought to take place?—Certainly.

893. (Rear-Admiral Hext.) With reference to what you have told us about the possible extension of the Albert Dock, what would you consider should be the depth of water in the river? You must bear in mind, of course, that you say that you are going to bring deeper ships in?—I think, as far as the docks are concerned, if they could have a pool there of 30ft. at low water, it would not matter very much what was down below; but still we know from experience that it is very difficult to keep pools free from mud. As far as the Dock Companies are concerned, they would like to have water opposite their entrance, so that if anything went wrong—if a ship ran into their gates, or anything happened—the ship could be taken away, so that she would not run aground; otherwise we much prefer that they should come in on the top of the tides. We do not want them to come in at low water, because the mud is a disastrous expense now, and if they came in at low water it would be worse.

894. In answer to Sir John Wolfe-Barry with regard to the depth required and the width required for the ships swinging, you would require a greater depth of water, I take it, for the new entrances?—Yes; except that of course the ships would still be able to come in on the top of the tide.

895. And you say that the depth of the pool that you wish to have outside the entrance would be 30ft.?—I should like to have the pool so deep that at low

Mr. H. C.  
Baggallay.

12 Nov. 1900.

water the largest ship that could come up would be able to float if anything went wrong.

896. (Sir John Wolfe-Barry.) Of course, a pool of that kind does not get rid of the difficulty of delays by fog or other causes?—No.

897. (Chairman.) Now will you go on to the next part of your evidence?—The East India Docks were commenced in 1803 and completed in 1806. They are situated in a sharp bend of the river near the mouth of the River Lea, and are about  $6\frac{1}{2}$  miles from London Bridge by water, and nearly 4 miles from Fenchurch Street by rail or road. The total area of this property is 71 acres, including a water area of 33 acres. The docks consist of a basin, an import and an export dock, and are entered from the river by two locks. The depth of water in the centre of the river opposite the entrances is 15ft. at low water, the depth shoaling to about 8ft. at low water at the piers. The principal entrance for ships is the lower lock, which is 100ft. long, and 65ft. wide, with a depth of 31ft. on the sill, which would give 27ft. at high water at neap tides. The Joint Committee dredged the river bed at the entrance to 31ft. 6in. below Trinity. That is immediately opposite the gates. All ships enter the dock through this lock on a level. The upper lock is only 210ft. 6in. long, 47ft. wide, with a depth of 24ft. 10in. on the sill. This lock is used by barges only. It is impossible to lengthen either lock to any extent, owing to the narrowness of the strip of land between the basin and the river. The basin has an area of 6 acres, and a depth of 33ft. in the centre, and alongside the two quays, and provides two berths for large ships, one being about 400ft. in length, and the other 500ft. These two berths have warehouses running their whole length, and behind these are other warehouses. A line of railway over a swing bridge connects the basin with the lines in the dock. The upper dock in the plan is the import dock, and the lower one is the export one. The import dock is approached from the basin by a lock 209ft. long, 47ft. 9in. wide, and 24ft. 10in. deep. The level of the water in these docks is not maintained by pumping, therefore a deduction of 4ft. or 5ft. must be made for neap tides. The import dock has an area of  $17\frac{1}{4}$  acres, with a depth of 26ft. Its length is 1,410ft., and width 535ft. Eight timber jetties project from the quay on the north side, and the dock is surrounded with sheds, behind which are warehouses. The export dock is entered from the basin through a passage with gates 60ft. wide, having a depth of 30ft. The area of the export dock is 8 acres, being 778ft. in length and 436ft. in width, with a depth of 26ft. 10in. There are two jetties projecting from the west quay of this dock. There are sheds on the north, south, and west quays, with large warehouses behind the sheds on the north quay. There are about 8,000 lineal feet of quay space available for discharging ships in this dock system, or, in other words, quay berths for 23 ships of an average length of 350ft. There are no lines of railway in the import dock, but rails are carried along the north quay of the export dock. The terminal station of the London and Blackwall Railway is between the south quay of the export dock and the river. In front of the station is the Brunswick Pier and wharf, where steamers conveying passengers up and down the river call regularly, and continental steamers discharge and load horses and cattle. The total floor area of the sheds and warehouses is 871,200 square feet. There is also in these docks accommodation for the storage of wine, etc., in the vaults. There are 26 hydraulic cranes and 51 hand cranes in this dock, 12 hydraulic lifts and 19 hydraulic jiggers for dealing with cargoes of ships. I daresay your Lordship knows that a jigger is like a crane, but instead of having a jib the chain is passed over a pulley. It is merely a hauling engine for dealing with cargoes of ships. Hydraulic power is laid on all round the quays, the power being furnished by four pumping engines. The dredging amounts on the average to 65,000 tons per annum, which gives about 2,000 tons per acre. This large amount is caused by the necessity of working the ships and barges in and out on the level, the locks being too short for locking as explained above.

898. Are these docks sufficiently large for that class of trade up to the present time?—Yes, up to the present time. They are always well filled with ships. They supply a demand. They take ships of a certain class only; a great many small sailing vessels go into the East India Docks.

899. Are there many dutiable goods in the warehouses?—That I cannot say.

900. Are there any vessels with wines and spirits?—Yes; of course they must be dutiable, but I cannot speak anything about them. There are vessels for wines, of course—quite small vessels. In the basins ships of considerable size go, ships of 450ft. by 50ft. beam go into the basins.

901. Is that always full?—Yes, that is always full, but there are only two berths there. They are always used by Donald Currie's boats.

902. Are there any assigned berths to a particular company?—Yes, I believe those are assigned to them. I have just been informed that the wine I have mentioned that there is accommodation for is more or less for the shipping companies, and not the trade. It is not used much by the trade.

903. It is for the purpose of provisioning ships?—Yes.

904. (Rear-Admiral Hext.) Could these docks be improved to any extent, in your opinion?—Yes, they have been improved of late years. The cut from the basin into the export dock was made some four or five years ago, which has enabled much larger vessels to go in, and it has once or twice been in the contemplation of the Joint Committee to remove the lock that now separates the basin from the import dock, and put a deep cut there instead, so as to take a larger class of vessel into the import dock. But that has not been necessary, nor is it necessary, at the present moment, because the dock is well filled with small ships.

905. Therefore it fulfils a want?—Yes, and if there is a further want it can be dealt with.

906. And I presume it could not be altered to any great extent without a very large cost?—I suppose it would cost about £100,000 probably.

907. That is only to make that one alteration?—Yes, that one alteration.

908. But the whole dock itself could not be deepened and enlarged in any possible way with regard to the surrounding land, I take it?—Yes, in the same way as in the case of the West India Dock, which we are coming to next. A false quay is put in front of the masonry quay at a lower level, and then the ground is dredged up to that point only, and slopes up to the old wall. By slightly reducing the area of the dock, with a false quay you can get the centre part deeper without undermining the foundations of your walls. That has been done in several cases. In fact, in the export dock a few years ago we found the foundations slipping a little, so we drove timber piling in front, and that might be safely dredged down to 28ft.

909. My question was more with regard to the power of enlarging the docks?—No, not enlarging.

910. (Sir John Wolfe-Barry.) Is the basin used as a lock?—It is practically used as a lock for these larger vessels, because the ships must all pass in on a level, so that we cannot keep the water above the tide of the day, and, of course, then all the other gates can be opened; so it makes no difference.

911. At neap tides do you lower the water in both the docks down to the level of the river?—Yes, practically.

912. I see it is marked here that the depth is 33ft. on the plan, but I suppose you must deduct from that 4ft. or 5ft. for neaps?—Yes.

913. Therefore the available depth is 28ft.?—Yes.

914. I mean ships after discharging in the basin would be exposed to the fact that the water might be lower than the 33ft.?—Yes.

915. And there is no power of extension of premises here?—I think not, unless it was some very big scheme of taking up the River Lea. There is a very great bend in the Lea there, which, of course, might be converted into docks, but I do not think it is quite practicable.

916. (Chairman.) Now, will you go on to the next docks?—The West India Docks are the oldest docks in London. They were commenced in 1799, and completed in 1802. They are situated a short distance up the river from the East India Dock, and are six miles distant from London Bridge by water, nearly three miles distant from Fenchurch Street by rail, and about three miles from the busiest part of the City by road. The total area of this

dock system, including Poplar Dock (which is let to the North London Railway Company on a long lease), is 231 acres, with a water area (exclusive of the Poplar Dock) of rather more than 100 acres. The system comprises three parallel docks extending across the Isle of Dogs, the two upper ones being connected with the river on either side by cuts into a basin, which in turn communicates with the river by a lock. The lowest or South-West India Dock is the old City canal. This also communicates with the river on both sides, on the Limehouse side by a cut, and on the Blackwall side by a cut into a basin, and thence by a lock into the river. This latter basin is connected with the above-mentioned basin on the Blackwall side by means of a junction dock. In this way the three docks are all interconnected. The depth of water in the centre of the river opposite the "Blackwall" entrance is 17ft. at low water, shoaling to 12ft. at lock gates. The lock, which was rebuilt five or six years ago, is 480ft. long (and not 430ft. as figured on the plan)—there is a clerical error on the plan—60ft. wide and 30ft. on the sill, giving a depth of 26ft. at neap tides. This entrance leads into a basin, called the Blackwall basin, which communicates by passages with the import and export docks, and also with the junction dock. The import and export docks are also connected with the river through Limehouse Basin by a lock into the river. This lock is not now used. The level of the water in these docks is always kept up to Trinity level by pumping, and whenever the draught of vessels demands it, the level is maintained at 18in. above Trinity. This is effected by powerful engines placed near the Blackwall entrance. The river entrance to the South-West India Dock is 300ft. long, 27ft. deep, and 55ft. wide. When I say 55ft. wide, that is on quay level. There is a slight batter on the walls, which reduces the width at sill level to 52ft. The lock is at present being deepened to 29ft. and lengthened to 480ft. This dock has also an up-river entrance at Limehouse, which is not now used. All the locks are crossed by public road swing bridges. These bridges, which cross the centre of the locks of almost all the Joint Committee's docks, except at Tilbury and at Galleon's, cause considerable delays to the locking, and are a continuous source of trouble and annoyance. I will now pass to the basins and docks. The Blackwall basin has an area of 6½ acres, with a depth varying from 30ft. to 32ft. The passages from the basin into the import and export docks are 60ft. wide and 30ft. deep.

917. Is that at spring tides, or at neap tides?—It is always maintained at Trinity, or rather, I should say, it is a foot and sometimes 18 inches above Trinity. These passages are crossed by the Millwall Railway, which is carried on swing bridges. Passenger trains run in each direction every quarter of an hour during the daytime, in addition to the goods trains. The passages are also crossed by the Joint Committee's swing bridges for cart traffic. Out of the Blackwall basin there also lead a lock into the Poplar Dock for the North London Railway Company, a graving dock which is let to the West India Graving Dock Company, and a passage into the Junction Dock. This basin is only used as a passage for ships and barges going into the docks, there being no quay accommodation there for ships of any size. The import dock has an area of 30 acres. It is 2,600ft. long, 500ft. wide, and has a depth of 25ft. on the north side, but at present only 20ft. on the south side. That may be taken as an illustration of how the docks are being deepened as required. It was 20ft. before. On the north side, by putting a false quay, it has been deepened to 25ft. Some four or five years ago a false quay on timber piles was built on the north side, which has enabled deeper water to be obtained. A similar quay is now being constructed on the west end to provide an additional deep berth. As already stated, this dock can be and is, when necessary, maintained 1ft. or more above Trinity, which would give a depth of 26ft. at the quay. Six of the larger class of vessels can be accommodated at this false quay. There are 11 large warehouses on the north side of this dock, capable of accommodating 95,000 tons of goods, each warehouse being fitted with hydraulic cranes. In front of the warehouses there are open sheds for the protection of goods, and lines of rails are carried at the back of the warehouses. On the south side of the import dock at each end are large wood wharves. The centre of the quay is set apart for the storage of rum and spirits. There is extensive vault accommodation here, also vats capable of holding from 500 to 25,000 gallons for mixing, blending, &c. There is also a cold storage

building capable of containing 100,000 sheep on the north quay. The export dock has an area of 24 acres. It is 2,600ft. long, and 400ft. wide, but has only a depth of 22ft., which can, however, be raised to 23ft. 6in. by pumping. It is in the contemplation of the Committee to deepen this dock, and place false quays in front of the existing walls. There are six jetties projecting from the southern quay. At present this dock is only used by a smaller class of vessels. There is communication between the import and the export docks at the west end through the Limehouse basin, which has an area of about 1½ acres. This basin is only used at present for the passage of barges and as a convenient place for the repair of the Committee's floating craft. Between the Blackwall basin and the South-West India basin is the Junction Dock before mentioned. It is 1 acre in extent, being 320ft. long and 150ft. wide. There are lock gates at either end, the passages being 45ft. wide, with a depth of 25ft. Around this Junction Dock and along the quays of the export dock are extensive wood sheds, furnished with travelling cranes on overhead gantries, many of them worked by electricity. There are also slipways where vessels with timber cargoes can discharge from portholes. The South-West India Dock basin has an area of 5½ acres, with a depth of 29ft. The water in this basin and also in the South-West India Dock itself can be raised 18in. by allowing the water to flow from the Blackwall basin, where it is pumped. This basin has on the south side sheds and lines of railway. The passage into the main dock is 55ft. wide—that is, 52ft. on the sill with the batter I should say—and 27ft. deep, with a pair of gates. This passage also is crossed by the Millwall Railway and a footbridge. The South-West India Dock itself is 2,650ft. long by 450ft. wide, and has a depth of 29ft., with a water area of 26½ acres. On the north side there are seven timber jetties projecting from the quay, which will, as ships grow longer, probably be removed, so that the ships may lie alongside the quay. On the north quay there are lines of rails and single floor sheds. On the south quay there are extensive warehouses and double-floor sheds with lines of rails running behind them. There is a cold storage warehouse here capable of holding 14,000 carcasses of mutton. The length of quays available for ships discharging in this group of docks is 21,000ft., and the quays can accommodate between 50 and 60 ships of the class that use these docks. The floor area of the sheds and warehouses is no less than 4,377,780 square feet, and is capable of storing 180,000 tons of goods; 37,000 puncheons of wine and spirits can be stored in the vaults connected with these warehouses. To provide for the carriage of the goods, there are 12 miles of railway and 4 locomotives, the lines being connected with the Great Eastern Railway at Millwall Junction. There are two installations of hydraulic pumps, and hydraulic mains are laid down on all the quays. The docks are illuminated by electricity, which is generated at an installation on the north quay of the Import Dock. There are 20 steam cranes, and one electric crane at these docks, 135 hydraulic cranes and lifts, 120 hand cranes, 23 electric travellers for moving timber, and 29 hydraulic jiggers, also a floating crane that will lift 20 tons at 29ft. radius, and another that will lift 6 tons at 35ft. radius. Of the swing bridges, of which there are 13, 10 are worked by hydraulic power and three by hand; there are also two drawbridges worked by hydraulic power. The dredging in these docks amounts on the average to 63,000 tons per annum, equal to about 630 tons per acre. These docks, the oldest in London, are an illustration of the foresight of those who were responsible for their design, as at the present day there are few docks anywhere built on so good a plan for accommodating large ships of various lengths. It is true that as ships have grown in length and altered in shape it has been necessary to reconstruct or enlarge the dock entrances of nearly all the docks in London, and this has in fact been done at these West India Docks at the Blackwall entrance, and is now being carried on at the South-West India Dock. But it has not been necessary in London, in order to meet the demands of modern shipping, to wipe out the old docks and construct new ones, as has been necessary at many other ports in the kingdom. There are few docks in the kingdom so suitably planned for accommodating large ships as the Albert Docks and the West India Docks. It is in depth only that ships are beginning to outgrow them, and this can be remedied should improvements in the river enable deeper vessels to navigate the river to them. Tilbury, as before stated,

Mr. H. C.  
Baggallay  
13 Nov. 1900

is deep enough for all present purposes. There are no docks under the control of the Joint Committee that have become obsolete, as even the smaller and shallower docks are well filled with shipping of the smaller class which has to be provided for. What is now required is additional accommodation for the largest vessels, not to replace small docks by larger ones, as the small docks still serve a useful purpose.

918. Are you satisfied with the present depth of the river opposite these docks, or do you think it ought to be deepened?—Only for the same reason that I gave before. I think that the general approach up to these docks is sufficient.

919. You apply to these the same observations that you made to us on the other docks?—Yes.

920. (Sir John Wolfe-Barry.) Is there any limitation of depth of dredging in the river over the Blackwall Tunnel?—I am afraid I forget what the depth is.

921. You do not know what depth it is below the bed of the river?—No.

922. What depth of lock are you going to construct at the South Dock?—We are going to make the sill 29ft. below Trinity, which is the same depth as the dock itself, and make it 480ft. long instead of 300ft.

923. You consider 480ft. long enough?—Quite long enough I think for that position of the river.

924. You take off something, I suppose, for the gates and for the manœuvring of the vessels?—Yes. It will take the class of vessels likely to come up there. I do not think any ship over about 450ft. is ever likely to come up there under any circumstances.

925. With regard to the railway, it seems an extraordinary arrangement, closing all these passages. Which traffic has to give way—the railway traffic?—I cannot say legally exactly what it is. I know practically that the trains are stopped by the ships, very often, by agreement.

926. The railway, I suppose, came there after the docks were made?—Yes; a portion was made by the old West India Dock Company.

927. Where does it terminate?—It goes down to Millwall Docks. It would be a good thing, some day, if now that the western entrances are not used, they could take the railways down there, and keep the eastern side clear.

928. I was going to ask whether there has been any proposal of that kind?—There has been no proposal, but I have often thought of it. But it would be rather a costly business, I am afraid, to acquire the property.

929. It is a great improvement, you think, to the working of the dock?—Very great. Take a ship going now into an import dock. There is a public road across the lock; then she has to wait for the railway bridge as well as the Dock Company's bridge (which latter is of course nothing, because that would have to be opened). There are two trains in every quarter of an hour, one in either direction, in addition to the goods trains.

930. Of course, once a train is signalled, the railway bridge is hopelessly stopped against ships?—Yes.

931. Is there any land belonging to the Company here which is not occupied?—A very small piece on the south side of the South Dock basin, and just a little at the south-west corner which is not occupied. It is a low piece of ground just behind the sheds, near the angle, but a very small area.

932. Did you say you were constructing a new lock to the South Dock?—No; we are altering the old one.

933. At what cost?—£40,000. It will be about £50,000 altogether, because we shall put in a sewer for the County Council. The whole cost will be about £50,000.

934. You spoke of other things being in contemplation, such as deepening berths?—Yes, in the export dock.

935. What is the total amount of money that you have in contemplation to spend at the West India Dock?—I have not seen any estimate later than the one I made a year ago. That was £90,000.

936. (Mr. Ellis.) I think it is in respect of these docks that you have electricity as an agent of motive power. Are we to take it that you have not it at Tilbury at all?—We only use electricity at Tilbury for lighting purposes.

937. Not for motive power?—No.

938. Nor at the Victoria and Albert?—No, I do not

think we use it there at all. It is chiefly used in the West India Dock for the wood. I beg pardon. I have just been told that recently a firm have put up some electric cranes at the Albert Dock, and the Joint Committee are supplying power. I did not know that.

939. At the East India Dock have you any electrical motive power?—No. Practically, apart from what I have just been told, the West India Dock is the only place where the power is used in that way. But we do supply power to small works. Perhaps a man has a grindstone to work, or something of that sort.

940. Are you satisfied with it for dock purposes?—I think so. I do not say that I should introduce it for many purposes at these old docks, because the hydraulic pipes are laid down, and there are many expenses. At the wood wharves we find the electric cranes are very useful. The 6-ton cranes lift these large baulks. Twenty of them have now been either built or converted from old steam, and are working wonderfully well.

941. You tell us very little about the Poplar Dock. Is that leased to one of the railway companies?—It was a lease granted by the East and West India Dock Company to the North London Railway of Poplar Dock, then known as the Timber Pond Dock. That was a lease of that land and land round it connecting with the dock for 999 years from 1st July, 1850, at a yearly rent of £1,200 a year.

942. Then the Joint Committee that now is the owner has no control over that?—No, not beyond the 999 years' lease.

943. For all practical purposes it has passed out of their hands?—Yes, excepting this: they have the control of a ground landlord to prevent them doing certain things, although they cannot interfere with their business in any way.

944. They cannot extend it, or incorporate it for their own purposes, without cancelling the lease?—No.

945. (Chairman.) Except, of course, by applying to Parliament—

(Mr. Ellis.) Quite so.

(Witness.) I am told that certain rates for passing through the basin, and so on, are charged.

946. (Sir John Wolfe-Barry.) Who built the Poplar Dock?—I believe they built it themselves, on an old timber pond.

947. The railway company went to the expense of making the dock, and the £1,200 a year is in the nature of a ground-rent?—Just so.

948. (Chairman.) Now, will you go to the next dock?—London Docks. The area of this property is exactly 100 acres, 40 acres of which represent water space. It is situated at a short distance below the Tower Bridge, and therefore close to the City. The docks were commenced in 1800 and completed in 1805. There are four entrances, two at Shadwell, one at Wapping, and the Hermitage entrance; the last-named is now closed, and not used. The depth of water in the river opposite to Shadwell is 11ft. at low water. The lower entrance at Shadwell, known as the new Shadwell Lock, is 350ft. in length, 60ft. wide, with a depth of 28ft. on the sill, which gives an available depth of water at neap tides of 24ft. The old entrance, which is very little used now, is 180ft. long, 45ft. wide, and 24ft. on the sill. Both these locks are crossed in the middle by swing bridges carrying a public road, and this naturally interferes very much with the locking of vessels and causes delay. At the Wapping entrance the depth of water in the centre of the river is about 15ft., shoaling to about 9ft. at the dock entrance. The lock is 170ft. long, 40ft. wide, and 23ft. at the sill. This entrance is almost entirely used by barges, and most of them pass in and out on the level. Starting from the Shadwell entrances there are two basins, Shadwell new basin, and Shadwell old basin. Between these and the Eastern Dock are locks; that from the old basin is not now used, but the lock between the new basin and the Eastern Dock is 350ft. long and 60ft. wide, with 28ft. on the basin sill and 21ft. on the dock sill. These locks are also crossed by swing bridges carrying public roads. Shadwell new basin has an area of 5 acres, and a depth of 28ft. It has quays with large warehouses and sheds on three sides of it. The old Shadwell basin, which is connected with the new basin, has an area of a little more than one acre, and a depth of 25ft. This basin is not

much used by ships. The Eastern Dock has an area of 6½ acres. It has a depth of 21ft.; but as the level of the water is raised by pumping from 1ft. to 18in. above Trinity, the available depth is greater. The depth could not be increased, as the Thames Tunnel passes underneath. In this system of docks the water level is maintained by pumping, in rather a different way from what it is at the other docks. The basins are not pumped, only the docks, and that enables vessels to go in through the basin lock on the level without lowering the water in the docks themselves. This dock also is surrounded with spacious warehouses. It is connected with the Tobacco Dock, which is only about half an acre in extent, and practically affords only one berth, but there are very large warehouses built on either side of it. Between the Eastern and Tobacco Docks is a passage 200ft. long, 45ft. wide, and 21ft. on the floor. This passage is crossed by a public road-bridge. From the Tobacco Dock to the Western Dock is another passage 200ft. long, 45ft. wide, and 20ft. deep. This passage is only crossed by a dock bridge. The Western Dock has an area of 20 acres, the depth being 21ft. There is an export jetty projecting from the western quay, and the whole dock is surrounded by sheds and very large warehouses. There is communication from the Western Dock to the river through Wapping basin. Between the dock and this basin there is a lock 170ft. long, 40ft. wide, with 23ft. on the basin sill and 20ft. on the dock sill. Wapping basin, which has an area of three acres, and a depth of 23ft., is entered from the river by the Wapping lock already described, and is provided with quays and sheds, and the company's workshops are situated here. The level of the water in these docks, but not in the basins, is maintained by pumping. I have already mentioned that. The method in use is rather different from that at the other docks, as there are two sets of pumps, one drawing water from the river and the other pumping it from the basin, both delivering into the dock. There is a great advantage in this arrangement, as the water in the basin, having deposited its mud there, but little mud is carried into the docks themselves. It is much more economical to remove mud from the basins and entrances than it is from the docks. At the quays, which run along the entire docks, vessels are berthed up to 330ft. in length and 24ft. in draught in the basin and 20ft. in the docks. The quays are about 12,000ft. in length, and will therefore accommodate 36 ships of this size. But although the lock will only dock shorter vessels, vessels up to 400ft. go up the lock into the basin on a level. Any ships that want to go into the Western Dock, which is a very important one for wool, if there is not water enough in passing through the tobacco cuts, where the navigation is a little difficult for ships of certain shape, owing to the inverts being rather sharp there, they lighten in the basin, and then go on into the dock after they have reduced their draught a little. There are no railways in these docks, as the quays were covered with warehouses nearly to the water's edge long before railways were invented; but at the western end of the Western Dock goods can be received by railway from the East Smithfield depot. This is situated on the opposite side of the road, and from it wagons can be brought by a bridge over the road into the docks, and lowered by a lift. The immense floor area of the sheds and warehouses, which is no less than 3,092,000 square feet, is capable of containing 174,000 tons of goods; 83,500 pipes of wine or spirits can be stored in the vaults in these warehouses. In rear of the warehouses and vaults are the cart areas, in which vans and carts receive their loads direct from the warehouse and vaults. This dock has within the last few weeks been illuminated by electric light, the installation having been made near the Hermitage entrance. Hydraulic mains are laid all round these docks, the power being obtained from pumping engines recently placed in the St. Katharine Dock. There is one steam crane capable of lifting 25 tons, a hand crane to lift 20 tons, 118 30-cwt. hydraulic cranes, 14 hand cranes, and one small steam crane. There are, in addition, 18 hydraulic jiggers and 22 hydraulic lifts. The average amount of dredging carried out in the London Dock is 24,000 tons per annum, equal to 600 tons per acre.

949. You say this dock is always full?—Always full.

950. And you do not think that it wants any alteration to meet the requirements of the trade?—No, I think not. I think that any alteration should be in the form of addition, not alteration.

951. Are the warehouses full?—That I cannot say, but the warehouses on the quays are practically sheds. They take the goods out of the ships and put them into the warehouses. In fact, you may consider them so many storage sheds.

Mr. H. C. Baggallay.

13 Nov. 1900.

952. (Sir John Wolfe-Barry.) Are the walls battering in the various entrances?—Not as a rule. The south dock entrance batters from 55ft. at the top to 52ft. at the bottom.

953. Do you say the south dock?—The South-West India Dock.

954. I was talking of the London Dock. Are the entrances at the Tobacco Dock and the Eastern Dock and the Western Dock battering in size?—Yes, they are to a certain extent. The only ones really that are very bad in that way are the cuts into the Tobacco Dock, the one on the western side and the one on the eastern side. There there is a very sharp invert, and a sort of curve better. So much so that at the extreme edge there would not be more than 10ft. of water in depth. It comes up with a very sharp curve.

955. As you know very well, the modern ship is like a square box in cross section?—Yes; but fortunately the very modern ships built in that way do not go into the London Docks.

956. Perhaps that is because they could not get in there. At any rate they could not go into that dock if they wanted to?—No.

957. Therefore, these widths and depths are, to some extent, more favourable to the dock than would appear?—They are not, except in the case of these old passages in the London Docks. In all the other locks you practically get an efficient depth of the depths given. Take the Albert Dock, for instance. It only comes up 18in. just at the edges, which would not affect a ship in any way, but in the lock that is now being altered at the South West India Dock, it came up 5ft., and that is why the alteration is being made; the new invert will be flat.

958. I was drawing attention particularly to the London Docks?—In those passages they are very much narrower at the bottom through the curvature.

959. Are there any proposals to spend money at this London Dock in the way of improvements?—It has often been thought of to try to open up those passages, but it has always been looked upon as too costly.

960. Therefore you think they will remain as they are?—I think so.

961. And to that extent the London Docks will always be subject to limitation in accommodation of vessels?—Yes, unless improvements were made through the Wapping entrance. Of course they might be made in that way, but the present route is to go in at the Shadwell entrance, and pass through the Eastern and Tobacco Docks into the Western.

962. I suppose the Shadwell is a very much more convenient entrance for ships?—Yes.

963. It points better?—Yes, and not only that, but it is so much larger. No ships can enter Wapping or those higher entrances except on the level.

964. Why should it be so expensive to make these alterations?—The ground is very bad.

965. The foundation is very bad?—Yes.

966. No estimate has been made of the cost, I suppose?—No.

967. Therefore there are no proposals for improving the London Docks?—No, I am not aware of any.

968. (Chairman.) I suppose that in course of time the new style of vessels, the square beam vessels, will eventually prevail?—Oh, yes.

969. And these docks, which are only suited to the old style of vessel, will, in time, become obsolete?—The entrances will have to be altered.

970. Not yet, but in course of time they will become obsolete?—The entrances will, not the docks themselves.

971. I mean the entrances. Of course, you cannot get into the docks without altering the entrances?—Just so.

972. Then will you go to the next dock?—The St. Katharine Docks are situated immediately below the Tower Bridge, and are united to the London Docks by bridges across Nightingale Lane. They were commenced in 1825 and completed in 1828. The property contains 23 acres, including a water area of 10 acres. It is entered from the river by a single lock. The

Mr. H. C.  
Baggallay.

13 Nov. 1900

depth of water in the centre of the river at low water is 12ft. The lock is 180ft. in length, 45ft. wide, with 28ft. on the outer sill and 24ft. on the inner sill. There is a public road swing-bridge across the entrance. This entrance is a case in point. The invert tapers up to only 20ft. at the edges. It is 45ft. wide, but immediately on the edge of the walls it is only 20ft. instead of 24ft. deep. As the level of the water in this dock is not maintained by pumping, there is only an available depth over the inner sill at neap tides of 20ft. The basin has an area of 2 acres, and a depth of 24ft. The quays of this basin are not used by ships for discharging. From the basin there are passages into the Eastern and Western Docks 58ft. long, 45ft. wide and 24ft. deep. The Eastern Dock has an area of  $4\frac{1}{2}$  acres and the Western Dock an area of  $3\frac{1}{2}$  acres, with a depth of 24ft. The length of quay available for discharging ships is 5,300 lineal feet, and vessels up to 250ft. in length, with a draught of 24ft., can be berthed here. These docks are entirely surrounded by large warehouses which practically cover the whole of the land area. They are many storeys in height, and are built up to the line of quay at the water edge, the upper floors being carried on massive iron columns over the quay area; that is to say, the quays are underneath the upper floors. There

are no railways in this dock, the dock having been constructed before the days of railways. The floor area of the warehouses is 1,655,000 square feet, with accommodation for 86,000 tons of goods, and in the vaults for 37,500 pipes of wine. The hydraulic pumping engines which have recently been placed in this dock provide the power for the hydraulic cranes in this and the London Dock. There is electric light in this dock, which is supplied from the installation in the London Dock and supplemented by some small dynamos situated at the basin. There are 55 hydraulic cranes and 27 hand cranes, 21 hydraulic lifts, and 6 hydraulic jiggers. The dredging of these docks averages 16,000 tons per annum, being equivalent to 1,600 tons per acre.

973. (*Sir John Wolfe-Barry.*) I suppose there are no proposals for deepening or extending the St. Katharine Dock, or improving it?—No.

974. (*Chairman.*) Does that conclude your evidence?—Yes, on this particular point.

975. Without going into the other questions which we shall deal with hereafter, we may consider that that concludes this portion of your evidence?—Yes.

Recalled  
6696.

(Adjourned to Thursday next, November 15th, at 12 o'clock.)

# ROYAL COMMISSION ON THE PORT OF LONDON.

## FOURTH DAY.

Thursday, 15th November 1900.

PRESENT :

The Right Hon. The EARL EGERTON OF TATTON (*Chairman*).

Sir ROBERT GIFFEN, K.C.B., LL.D.

Sir JOHN WOLFE WOLFE-BARRY, K.C.B., LL.D., F.R.S.

Rear-Admiral Sir JOHN HEXT, K.C.I.E.

JOHN EDWARD ELLIS, Esq., M.P.

CECIL OWEN, Esq., *Secretary*.

(*Chairman*.) I will call upon the Secretary to read a Resolution of the Commission.

*The Secretary read the following resolution:—*

In order to carry out the decision of the Commissioners, announced at their last meeting, they have resolved that any persons or public body deeming themselves interested, who wish to appear by counsel, shall make application in writing to the Secretary on or before Tuesday, December 4th, stating the grounds upon which they desire to appear.

That the Commission propose retaining the conduct of the inquiry referred to them entirely in their own hands, but will accept the assistance of such counsel as and when they think necessary.

That all witnesses except as hereinafter mentioned will be called and examined by the Commission.

That if the evidence of any witness shall affect the interest of any persons or body represented by counsel, application may be made to the Commission for leave to cross-examine such witness.

That if it be desired to call any witness not examined by the Commission, counsel must apply for permission to call such witness, who will be examined as the Commission may think fit.

That the extent to which counsel may address the Commission will be determined at a later stage of the inquiry.

Mr. FREDERIC ELIOT DUCKHAM called and examined.

976. (*Chairman*.) You are general manager and engineer of the Millwall Docks Company?—Yes; I am a member of the Institution of Civil Engineers, and I have been engineer of Millwall Docks since 1868; I was formerly at the Victoria (London) Docks. Last year I was appointed general manager and engineer of Millwall Docks. The Millwall Dock Company was incorporated by the Millwall Canal, Wharfs, and Graving Docks Act, 1864, as the Millwall Canal Company. The property of the company is situated on the Isle of Dogs, on the northern shore of the Thames, adjoining the India Docks on their south side. It comprises an area of 233½ acres, of which 205 acres are freehold, and 28½ held on long leases. It may be divided into three parts: (a) The part lying to the west of the East Ferry Road, which has been quayed and formed to a level of 5ft. 6in., above high-water mark, and which, with the water area of 35½ acres, the warehouses and other buildings, constitutes the Millwall Dock proper; (b) on the other side of the East Ferry Road, a tract of some 58 acres of freehold land and wharf property, originally acquired with a view to its forming part of the docks, but at present partly let on lease and partly applied to various uses in connection with the docks; (c) a long-leasehold estate of about 7 acres lying in the fork between the East Ferry Road and the Millwall Extension Railway towards the north-eastern end of the dock property. The river entrance to the docks is ¾ miles below London Bridge. The Millwall Extension of the Blackwall Railway is partly owned and worked by the Millwall Dock Company; it connects the docks by passenger service with the City, via Millwall junction, and for goods with all the railways in the northern and midland districts of England. The docks were constructed between 1865 and 1868, the engineers being Mr. (afterwards Sir) John Fowler and Mr. William Wilson, and the contractors Messrs. Kelk and Aird. The entrance from the River Thames is 80ft. wide, with 23ft. of water over the sills at Trinity high water. It is furnished with three pairs of gates, forming a lock 450ft. in length. What

can be divided by the middle gates into two locks of 250ft. and 200ft. in length respectively. The depth of the fairway channel of the Thames off Millwall Dock entrance is about 14ft. at low water.

977. (*Sir John Wolfe-Barry*.) At spring tides?—Yes. The dock is J shape, and the principal portion is 350ft. wide; the depth of water varies from 28ft. in the fairway to 24ft. alongside the quay walls. The walls are of brick backed with concrete and coped with blocks of Bromley Fall Stone. The total length of the quay is 3,040 yards. Near the south-east corner there is a dry dock 450ft. long by 65ft. wide, with 20ft. over the blocks at Trinity high water. This is emptied partly by discharge of the water through a culvert into the Thames; the remainder is cleared by pumping. When the undertaking was originated the design was not that it should be an ordinary dock, but should provide convenient sites for wharves, granaries, manufactories, shipbuilding, and other premises requiring large space and constant deep-water frontage. In 1864, when the powers were granted by Parliament, the shipbuilding trade on the Thames was in a very flourishing state, and the river frontage of the island was occupied by shipbuilding yards and other manufacturing premises. The company's works were commenced in the autumn of 1865, and occupied about three years in completion; but in the year 1866 the great financial crisis occurred, which, among other effects, destroyed for the time the shipbuilding industry of the port, and changed the position and prospects of the Millwall Canal Company (as the undertaking was originally called), so that in 1867 the directors were advised to adapt the works for ordinary dock business, and for this purpose equip them with sheds and other appliances, such as a complete system of hydraulic machinery, with a view to more economical working than was possessed at the time by other docks in London. On this footing the docks were opened in 1868, and since then the bulk of the business of the company (the name of which was changed by Act of Parliament in 1870 to Millwall Dock Company) has been ordinary dock business; but some land has been let from time to time for factory

Mr. F. E.  
Duckham

Mr. F. E.  
Duckham.

15 Nov. 1900.

and other purposes. Hydraulic power is used at Millwall Docks wherever applicable. At the entrance lock there are 30 hydraulic machines used respectively for opening and closing the three pairs of dock gates, for operating the sluices, and for working the capstans which pull the vessels and craft through the lock. These capstans have haulage power varying from one to five tons each. Distributed throughout the docks are 65 hydraulic cranes, most of them of 35cwt. capacity, and movable on rails placed at 7ft. 6in. gauge. Some of these cranes are on the masonry quays, and others are on dolphins. These dolphins are peculiar to the Millwall Docks; they are constructed of timber piles, driven into the bottom of the dock, leaving a width of 40ft. between the dolphin and the quay. They vary from 200ft. to 360ft. in length, and are equipped with hydraulic cranes as well as appliances for use in the discharge of grain. The leading advantage in this arrangement is, that goods requiring to be lifted by crane can be transferred immediately from the barge into the ship, or *vice versa*, at one operation, and where the ship is brought between the dolphin and the quay, the quay cranes as well as the dolphin cranes can be put into use for dealing with the cargo. When grain is being discharged at the dolphin, the cranes are used together with either the self-acting Priestman's skip or a self-discharging bucket. The skip fills itself on board the ship; the bucket has to be filled by hand, but both discharge themselves into hoppers on the dolphins, which have a storage capacity of twenty or thirty tons each, and outlets to a number of weighing machines. These outlets are under the control of the weigher, and the grain, after being weighed, is delivered either in bulk or in sacks into barges. The company has also pneumatic machinery for discharging grain cargoes. For the purposes of lifting heavy machinery, etc., a set of sheer legs of Day and Sumner's patent, having a height of 100ft., and a capacity of 80 tons, is erected on the southern quay. There are also hydraulic cranes of 5 and 15 tons capacity for heavy goods. Hydraulic power is likewise employed for moving the swing bridge, of 500 tons weight and 80ft. span, over the entrance lock for the drawbridge at the entrance of the inner dock, and for working sundry capstans, turntables, lifts, etc. There are five engines available for the production of hydraulic pressure, namely, three collectively of 1,080 horse power at the hydraulic engine house, supplied with steam at 65lbs. per square inch by 10 Lancashire boilers 7ft. in diameter by 22ft. long. From this engine house cast iron hydraulic mains, most of them of 6in. diameter, are laid so as to form a complete circuit of the dock, and have branches as required to the various sections and machinery. There are connected with this circuit three hydraulic accumulators, loaded to a pressure of 720lbs. per square inch. Hydraulic power is also obtainable from the two steam engines of collectively 360 horse power which are situated at the pier head, and are usually employed for lifting water from the Thames into the dock, as I shall describe later on. The buildings on the dock property include the eastern granary, having a storage capacity of 31,000 quarters of grain; the three western granaries, having collectively a storage capacity of 68,000 quarters of grain, and 40 warehouses, chiefly of brick, having one or two floors, and possessing a total floor area of 720,000ft. There are also corrugated iron buildings, having an area of 253,000 square feet, for timber storage, and one of 5 acres in extent, forming a depot for storing grain in specially designed railway trucks, from which deliveries are made to buyers' vans or railway waggons. This shed has in connection with it 10 miles of railway sidings and a delivery platform 300 yards in length. The granaries are fitted with elevators and other appliances. There are 48 miles of railway lines on the premises, which connect every part of the dock with the Millwall Extension Railway, and thus via the railways north of the Thames with the entire railway system of Great Britain. In addition to 1,500 railway waggons for dock purposes, the company has 10 locomotives. Seven of these are used for haulage of goods, and three for working the passenger traffic on the Millwall Extension Railway. During the last 10 years the goods traffic from and to the Millwall Docks has averaged 190,366 tons, and the passenger traffic over the line 819,129 passengers per annum. This is the railway that was referred to by Mr. Baggallay in his evidence the other day. There is a considerable goods traffic not included in these figures between the West India Docks and Millwall Junction. The Graving Dock with its engineering works is let. The principal trade of the Millwall Docks is grain, of which they receive and distribute about 3,000,000 quarters per annum, or about one-third

of the total grain imports of the Port of London. About 57 per cent. of the grain discharged in Millwall Docks goes overside. There is also a considerable trade in the import of wood of various kinds, and in the produce generally of America, Russia, Sweden, and Norway. The export trade is of a general character, and chiefly to the Baltic, Mediterranean, and Canada. From the opening of the docks in 1868 down to the end of 1899 there entered them 46,148 sea-going vessels, representing a gross registered tonnage of 37,219,587. In accordance with a wish expressed by the Royal Commission the following further figures are given showing the number and tonnage of vessels using the Millwall Docks in the years 1869, 1879, 1889, and 1899:—

		Number of Vessels.	Gross Registered Tonnage.
1869	- - -	1,344	517,836
1879	- - -	1,471	1,125,665
1889	- - -	1,672	1,491,649
1899	- - -	1,337	1,457,375

See 1002  
1011.

It might be interesting for me to add there that in 1869 the average per vessel was 385 tons; in 1879 the average was 765 tons per vessel; in 1889 the average was 892 tons per vessel; and in 1899, 1,090.

978. That is the registered tonnage, of course?—Gross registered tonnage. Among the vessels that have used the docks during the Canadian season are the steamers of the Elder Dempster Line, measuring 470ft. by 56ft.; 7,300 tons gross and 4,770 net registered tons. Comparing the present year up to the 11th instant with the corresponding period of 1899, there has been an increase so far of 51 vessels, representing 196,604 gross registered tonnage; there have been also passed through the lock—not admitted, but passed through—an annual average during the past ten years of 46,520 barges or river craft. May I explain here that those barges have been numbered twice. They have been numbered for coming in and going out. If you take it for those going through the lock, that is to say, those going in and those coming out, it would make up the 46,520.

979. Could you give us the maximum and minimum per day?—Yes, I will give you that presently. Of those barges coming into the dock 60 per cent. came in light, that is to say, without cargoes, and of those leaving the dock 25 per cent. of them went out light, that is to say, they brought in cargoes and went out empty. As many as 22 ships, representing 29,648 tons, and 146 barges have passed through the lock within one tide. The average number going through the lock in a tide was something like 100 barges in and out, but that was on an exceptional day for shipping. It was not an exceptional day for barges, but it came after four or five days fog, and then they wanted to get into the dock. To carry out the operations of docking and undocking it is necessary that work should commence considerably before high water, and to enable this to be done the water in the lock has to be emptied between the level of the dock and that of the river at, say, half-tide, and frequently this is repeated six or seven times during the period of working. The necessary consequence is that a large amount of water which has made itself comparatively clear by the settlement of its impurities in the dock is passed out into the river, and when the tide rises and so restores the level of the water in the dock, it brings in from the river a large quantity of mud in suspension, and this mud deposits itself over the dock bottom, extending to 300 or 400 yards from the entrance gates. This deposit has to be continually removed by dredging. The quantity so dredged in 1899 was 169,800 tons, representing an average of 4,783 tons per acre of the dock water area.

See  
1057-62.

980. (Chairman.) At what cost?—It is done by our own dredger, and costs us about 4d. per ton. I will describe the vessel to the Commission presently, and that will give you an idea as to how it is that it costs so little.

981. Is the 169,800 tons generally at 4d. a ton?—That is so. The amount of dredging has, however, no direct connection with the area of the dock; it is rather attributable to the frequency with which the dock gates have to be opened to dock and undock vessels and craft. The total net tonnage that entered the dock during 1899 gave an average of no less than 63,825 tons per acre of water space in the dock. That is taking the tonnage of the barges in addition to the tonnage of the ships. Of this dredging done by the company's dredger in 1899, 16,800 tons or about 10 per cent. was done outside the river entrance so as to keep the entrance channel clear. In addition to this ordinary dredging a large quantity of debris accumulates in the dock, mostly in consequence of what is dropped overboard from ships and barges. For the removal of this it is necessary to obtain the assistance of hired plant, and the amount spent in this kind of dredging since 1897 inclusive has been £10,060. The amount of this deposit may be put at 3,000 tons per week, which has to be continually removed by dredging. And in addition a large quantity of debris accumulates which has been dropped overboard from ships and barges. It is sometimes necessary to obtain the assistance of hired plant for this dredging, but the company owns a specially designed dredger, whereby the mud which is raised, instead of being deposited in barges and taken to sea, is dropped into two cylindrical tanks on board the dredger, having a capacity of 200 tons, and when these tanks are full the dredger steams to the east end of the dock. By closing the inlet doors the tanks are made air-tight, except as to the outlet pipe which is connected by flexible hose with a pipe on shore. This passes for about 200 yards under the wharf, railway, and public road to the company's open land beyond. The engines which were used to lift the mud and propel the dredger are now coupled up with an air compressor, air at 25lbs. pressure per square inch is forced into the tanks, and the freight of mud is expelled on to the land in about 40 minutes. This machine enables the company to cope with its dredging at a net saving of about £5,000 per annum, as compared with what would be the cost of dredging and taking the material to sea. The loss of water by the docking and undocking operations, more particularly by the necessary admission of barges early on the tide leads to a very large loss of water from the dock, and so as to restore this at other than spring tides, and be enabled to keep vessels of deep draught afloat, special water raising plant has been provided at the dock entrance. This comprises two vertical engines of 360 horse power, supplied with steam by five Lancashire boilers, and working two wheels of 34ft. in diameter, which scoop the water from the Thames through a culvert of 9ft. in diameter into the dock. These wheels are capable of raising 30,000 tons of water per hour, and so adding 1ft. 6in. to the water level of the dock during the two hours at the top of the tide. Reference has already been made to the pneumatic grain elevators. There are two of these machines afloat in Millwall Dock, each on its suitable barge. The apparatus consists of a vacuum chamber, from which the air is partially exhausted by means of steam engines situated under the deck of the barge. Flexible tubes pass from the vacuum chamber into the ship's hold. A strong current of air rushes up these tubes to replace that which has been pumped from the chamber, and by a special arrangement of inlet nozzle the air carries with it its load of grain. This grain deposits itself in the chamber and discharges itself automatically through a special apparatus into a garner. This feeds a number of weighing machines, which deliver the grain to barges in sacks or in bulk. This pneumatic arrangement has many advantages; it is more economical for working, as it dispenses with the labour of trimming the grain to the hatchway on board. The suction pipes occupy so small a space in the hatchway that cranes and other tackle may be simultaneously employed in loading or discharging other cargo. The machine works regardless of light or weather. The usual waste of grain on deck is entirely avoided. I will here put in some tables containing some of the principal statistics in relation to the Millwall Docks.

*The Witness handed in the following tables:—*

*(Table showing the vessels loading outwards in the Millwall Docks from 1st January to 30th September 1900. See Appendix, 4th day, No. 1.)*

*(Table showing the number of craft docked and undocked in the Millwall Docks during 10 years from 1890 to 1899 inclusive. See Appendix, 4th day, No. 2.)*

*(Table showing the number of vessels and gross tonnage entered the Millwall Docks each year from 1868 to 1899 inclusive. See Appendix, 4th Day, No. 3.)*

4238.

*(Table showing the tonnage and number of passengers from opening of Millwall Extension Railway to 30th June 1900. See Appendix, 4th day, No. 4.)*

*Mr. F. E. Duckham.*

*(Table showing the rates on shipping levied by the Millwall Dock Company. See Appendix 4th day, No. 5.)*

15 Nov. 1900.

*(Table showing the charges on barges levied by the Millwall Docks. See Appendix, 4th day, No. 6.)*

*(Summary of the statutory powers of the Millwall Dock Company. See Appendix, 4th day, No. 7.)*

One of the features which makes itself prominent is that an average of over 40,000 barges pass through the lock every year, bringing in goods direct to vessels or taking out goods direct from vessels. Of the amount of cargo exported from Millwall Docks 90 per cent. is received in this way. Of the goods brought into the dock by sea-going vessels, about 60 per cent. similarly passes overside into barges and is taken out of dock. In neither case does the Dock Company receive a penny from the barges or the goods they carry towards the expenses that it is put to in connection with the provision and maintenance of the dock and the dock master's staff, police, tugs, hydraulic power, ropes and other costs and risks connected with the establishment. Another matter which affects the earnings of the Dock has arisen from the increasing difference between the net register tonnage upon which dock dues are charged and the carrying capacity of the vessels. Years ago, probably when measurement of ships for tonnage was first introduced, the intention was that the measurement should represent, for harbour dues and other general purposes, a conveniently established figure equal in amount to the ordinary carrying capacity of the vessel. With the introduction of steamers a large addition was made to the hull to accommodate the propelling engines, and the tonnage due to the actual size of the ship requiring dock space became so much more than the net tonnage upon which the dues were paid. During recent years the designers of ships have chiefly aimed at so forming them as to carry the greatest amount of cargo on the smallest amount of registered tonnage, and so it comes about that steamers having a carrying capacity of 4,000 tons, and a gross register of 2,500 tons, now pay dock dues upon a net register of 1,600 tons only. I think you follow there that the net registered tonnage is referable only to the cargo-carrying capacity of the ship. The gross tonnage includes not only the cargo-carrying capacity, but the engine room and crew space and so on of the ship. These together make the gross tonnage, and for all purposes so far as the ship coming into dock is concerned she is a 4,000 ton ship in this case and she requires dock room necessary for a 4,000 ton ship, but we only get paid on the 1,600 or thereabouts, which is the net registered tonnage.

See  
1012-22.

982. Has the altered shape of the steamers anything to do with the increased tonnage?—That is so.

983. But while the shape of the vessel has been altered the calculation upon which the tonnage is founded remains the same?—Yes; that is to say that whereas the formula by which the measurements were taken in the old days when the ships were rounded was a very good one for arriving at their cubic contents or their carrying capacity which closely compared with their registered tonnage, in these days, when they are box shaped instead of being round shaped, that method of calculation is altogether wrong for arriving at the same result. You will notice that when a ship is advertised as to be built one of the things put forward is that she will carry, e.g., 4,000 tons upon 1,600 tons registered tonnage.

984. Has there been no alteration in any of the shipping Acts to meet that difficulty?—Practically none.

985. Is that a grievance on the part of the dock companies?—It is a decided grievance, because if we were working on the old lines we ought to get tonnage dues on the 4,000 tons instead of on the 1,600 tons.

986. And you lose so much in dues?—Yes.

987. (Sir John Wolfe-Barry.) That is partly due to the mode of measurement?—Yes.

988. And the fact that certain portions of the ship allocated to the crew are excluded?—The crew, and propelling power.

989. Are they not measured as having a larger amount of cubic capacity than actually exists in the ship?—That is so.

990. In deducting from the gross to arrive at the registered tonnage, certain portions of the ship are deliberately measured twice over, in accordance with an Act of Parliament?—Yes, and then struck off the tonnage.

991. (Mr. Ellis.) I do not understand you to suggest that this is specially and particularly applicable to the

Mr. F. E.  
Duckham.

15 Nov. 1900.

See  
1153-56.

Millwall Docks?—No, it applies to all docks and harbours.

As regards the size of vessels which they can receive, the Millwall Docks are limited by the depth of water over the entrance sills, namely, 28ft. at Trinity High Water; it is impossible for the Company to alter these, and the existing channel of the River Thames may therefore be said to be sufficient for the particular requirements of the Millwall Docks.

992. (Chairman.) Does that mean that you do not require the river to be deepened as proposed?—So far as regards vessels which are coming up direct to the Millwall Docks there is no necessity for deepening the river, but there is this to be taken into consideration:—A vessel may be coming up to go into the Millwall Docks; she will draw, say, 20ft. of water, and she will have only 14ft. at low water in the river. Supposing a fog comes on; that vessel has no safe anchorage in the river, and she will necessarily have to ground, because she cannot get back through the fog into deep water. Another thing:—Suppose a vessel comes up on the top of the tide, and for some reason we cannot admit her into the dock, instead of being able to wait at Deptford or Greenwich Reach for the next tide, she has to go down the river to Long Reach or somewhere where there is deep water—she has to go back perhaps 15 or 20 miles to wait for the next tide. That is where the inconvenience exists in our having only 14ft. at low water in the Thames.

993. What depth of water do the grain ships require?—21ft. as an average, but some vessels want 23ft., 24ft., and 25ft. even.

994. Then is it the opinion of your company and your own opinion that the river should be dredged to the depth of 30ft. up to the Millwall Dock or not?—No, I do not say 30ft. up to the Millwall Dock. I think 24ft.—10ft. more than we have now—would be enough. Of course, many things have to be taken into consideration. The river bed now has formed itself to its natural slope. If you dredged a channel 10ft. deeper than the present channel you might possibly bring down the foreshore on the two sides, and so get into difficulty with the wharves. But from our point of view, and from the point of view of the vessels using Millwall Docks, we should certainly like to have 24ft. at low water right away up to our entrance. It is, however, very difficult to make these, or any docks in London, remunerative under the present conditions of the trade of the port. The efforts of the Board are continually directed to economy in the working of the different branches of trade, and at the present moment plans are in a forward state for the provision, through the instrumentality of a subsidiary company, of (a) an additional warehouse for grain, capable of storing 100,000 quarters, with special appliances for reducing to a minimum the operations and costs involved in discharging, housing, and delivering grain; (b) a large yard on the company's land east of the Millwall Extension Railway, with sheds for the storage of timber, sidings, and roadways, and thoroughly equipped with modern electrical machinery for transporting timber from the quay side to the pile. It is anticipated that a considerable saving both in time and cost of working will result.

995. What proportion of the goods which enter your dock go by lighters, and what by railways. You seem to have better conveniences than some of the other docks for sending grain, for instance, away by railway. Can you give us any idea as to what is the relative proportion?—Of all goods that come in by water 60 per cent. goes away by lighter.

996. Does your grain go away by lighter or by rail? Some portion by lighter and some portion by railway. I can put that in afterwards.

997. What proportion goes by railway?—I can give you full particulars of what happens to the grain. Suppose you take the quantity out of the ship as being 100. The quantity delivered overside (this was during 1898) was 57·3 per cent. The quantity landed would be the difference, 42·7 per cent.

998. That is landed on the quays?—That is landed on the quays.

999. And it is not again put into lighters, I suppose; it goes then by road or rail?—I have given you there the quantity put on the quay. Some of that went into warehouses, some of it afterwards went into barges, and some of it went to railway. The quantity that went to rail-

way direct was 13 per cent., but the total that went away by railway, including what went subsequently from the warehouses, was 19 per cent.

1000. 19 in addition to the 13?—No, including the 13; that is the total. Then what went away in vans or carts was 12 per cent., and what went away in craft (that is to say off the quay in addition to what went away in craft overside direct) was 12 per cent.

1001. That is barges from the quay?—From the quay. If you will allow me I will put in a small table showing the disposal of grain cargoes discharged in the docks during 1898. (The witness handed in the following table.)

Disposal of Grain Cargoes, 1898.

Of the quantity discharged ex ship,
57 per cent. delivered direct to barges,
43 per cent. landed.
Of the 43 units landed,
13 units delivered direct to railway,
30 housed.
Of the 30 housed,
6 delivered to rail.
12 delivered to vans and carts.
12 delivered to barges.

1002. (Sir Robert Giffen.) About these figures of gross registered tonnage. Can you give the figures of net registered tonnage as well?—Only for the last year or so, because until last year it was the practice at the Millwall Docks to take only the gross registered tonnage of the ships in all our statistics, but when the change took place last year in our administration, it was decided that we should adopt the same system as that which is adopted at the other docks, and deal with the net registered tonnage instead of gross registered tonnage.

1003. Still your accounts would always show the net registered tonnage upon which the dues were to be charged?—Yes, that is so. We could get that for you if you wanted it, but I have not got it with me.

1004. I think we should like to have that. I would not ask you to take the trouble to give it for every year, but for those four years it would be advisable to show what the net registered tonnage was?—We will get that for you.

1005. (Mr. Ellis.) We should have the same figures on the same basis that the accounts apply to in all these cases. The accounts are of very little use if they refer to a different kind of measurement to that referred to in the statement?—I quite follow you.

1006. (Sir Robert Giffen.) Then do these figures include coasting vessels as well as vessels in the foreign trade?—They include coasting vessels that pay dues, that is to say, the coasting vessels that trade outside the Port of London. There are a large number of sailing barges and schooners, and so on, that trade with Faversham, and the Medway, and Sittingbourne, and those places, that do not pay dock dues.

1007. They have the privilege of being lighters?—That is so.

1008. Can you give us any idea of how much that is coasting trade is included in these figures, and how much is foreign trade?—That I can get for you; I have not it with me.

1009. Can you tell us the figures for 1899?—I cannot give you that now; I did not think that would be asked.

1010. Have you any idea what the proportion is—it is a small amount, I suppose?—Oh, it is a small amount; I should not think it was 5 per cent. of the total tonnage.

1011. Then the coasting trade is not a very big thing?—It is a very small thing. We get very little coasting trade, except schooners and so on, that would come to Millwall Docks for parcels of grain, and so on, to take round to the outports, but there is not very much in it.

1012. (Rear-Admiral Hext.) You said just now, "Steamers having a carrying capacity of 4,000 tons and a gross register of 2,500 tons, now pay dock dues upon a net register of 1,600 tons only." That, I presume, is a general average?—That is an average of three steamers that I know something about.

1013. It is an average, not an actual statement?—I will give you the actual statement, if you like.

1014. I do not want that. What I ask is, this is only an average?—It is an average of three actual ships. I have put it in round figures, otherwise it is quite right.

See 977

See 7037

See 7037

See 981

See 1066-67  
and 1134-38.

See  
1027-29.

1015. I only wanted to know whether that was an average. Will you give us the three steamers?—Yes. There is one steamer of 1,533 net registered tonnage, 2,431 gross registered tonnage, carrying capacity 4,050 tons.

1016. (Sir John Wolfe-Barry.) By "carrying capacity," do you mean the displacement?—No; that is the weight of the goods that she will carry.

1017. Then her displacement would be much higher?—Yes, because the weight of the ship would be in addition to the weight of the cargo. The second vessel is 1,491 net registered tonnage, 2,336 gross registered tonnage, carrying capacity 3,580 tons. The third vessel is 1,717 net registered tonnage, 2,685 gross registered tonnage, and 4,280 tons deadweight capacity.

1018. (Rear-Admiral Hext.) Are we to infer that those measurements apply generally to all the steamers that come up to the dock, or are those three ships specially selected?—If you take modern steamers—steamers, that is to say, such as have been built in the last three or four years—you will find that these proportions will generally apply.

1019. That does not quite answer my question. Does that represent the general run of the steamers coming to the docks, because you must recollect that many of your steamers are not three or four years old, but much older?—It applies to recent steamers, and not to the same extent to older steamers.

1020. The statement made here apparently is based on comparatively very recently built steamers?—I have a steamer here that was built fourteen years ago, and her net registered tonnage was 1,204; her capacity 2,500.

1021. Then you mean to say that, taking the total number of steamers entering the dock, that gives a fair guide as to the gross registered and net registered tonnage?—Of all the vessels that we get now that would apply, I should think, to one-third. With the other two-thirds the figures would not be the same, but the difference has been an increasing amount for some years past, and the three vessels that I have given you are those built within the last two years. There is another one that I can give you if you like.

1022. No, I think this is quite sufficient?—It does not go quite to the same extent, but it is in the same direction.

1023. (Mr. Ellis.) You refer to "dolphins" as being peculiar to the Millwall Docks. How long have they been in operation?—About twenty-eight years.

1024. Were they a part of the original plant?—No.

1025. What are the special reasons for putting them there?—For convenience in discharging ships direct into barges. A large quantity of the grain that we discharge, as I was saying just now, some 57 per cent. of it, goes direct into barges from the ship—does not come to shore at all—and for the convenience of working the grain into barges we have these dolphins; they are narrow structures of about 12ft. wide. We get the ship on one side and the barge on the other. The grain is lifted out of the ship by the cranes and delivered into hoppers, whence it can be delivered either in sacks or in bulk through the weighing machines into the barges.

1026. Are these specially applicable to the trade of Millwall Dock?—That is so.

See 994. 1027. You said in your evidence "the efforts of the Board are continually directed to economy in the working of the different branches of trade, and at the present moment plans are in a forward state for the provision through the instrumentality of a subsidiary company," etc. What is the reason of your requiring a subsidiary company?—It is because the Millwall Dock Company have exhausted their resources, and have no capital.

1028. It is a matter of finance?—Yes, and it is proposed to have a subsidiary company to raise a sum of money to provide the things immediately required.

1029. Supposing you had not that difficulty of finance you would prefer to do it yourselves?—Undoubtedly.

1030. (Sir John Wolfe-Barry.) I notice in describing your lock you describe the depth of water as 28ft.; that is at high water spring tides?—That is so.

1031. From that from 4 to 5ft. would have to be deducted for neap tides?—Yes.

1032. Is the sill flat?—No, it is curved.

1033. What is the available depth alongside the wall?—The entrance is 80ft. wide; the vessels going in there very rarely exceed 56ft., and do not at any time come close to the wall; but for these large vessels of 56ft. beam—vessels 470ft. long, the Canadian boats—we have to allow from 2ft. 6in. to 3ft. under their keels, that is in addition to their draught, for clearance when coming into the lock.

1034. Then they cannot get in at neap tides?—They cannot get in at neap tides.

1035. And similarly I suppose a loaded ship cannot get out?—That is so.

1036. Therefore your dock has fallen rather behind modern requirements in the way of the admission of large ships which desire to use it?—That is so.

1037. In fact nothing has been done I suppose to improve the dock since 1868 in the way of access?—That is so, but one thing I may say, it is a very rare thing indeed for us to have a vessel detained in entering the dock or in going out of the dock because of our not having sufficient water.

1038. But does not the knowledge of shipowners that there is that difficulty limit the number of vessels going there?—Just so.

1039. Shipowners do not like to run the risk of delays?—No, because it sometimes means £100 a day.

1040. Have you considered the Thames Conservancy programme? They propose to dredge to a width of 300ft. from the Albert Docks to Millwall Docks, with a depth of 18ft.?—Yes, I saw that.

1041. I gather from your evidence that you consider that insufficient?—18ft. would be an improvement, but it would not be enough for the reason that I was giving you just now. Vessels that are fog bound would probably get stranded or have to go back, say, 20 miles down the river, and then come up again.

1042. Do you want more than 18ft.?—We want more than 18ft.

1043. You suggest 24ft.?—24ft. would do it—either a 24ft. channel all the way down or a lay-by if it could be arranged for, though I am afraid it would be a mud trap; but if a lay-by could be provided a vessel could anchor there without having to go down to Long Reach.

1044. Speaking as an engineer, have you any doubt as to the capacity of the Thames to maintain such a depth if a channel were once made?—I think it would. I do not see why it should not. The amount of detritus coming down the river is not so very great; it appears to me that the greater part of what comes down is dredged by the Dock Companies. There is very little dredging done by the Thames Conservancy in the upper parts of the river.

1045. With regard to entering the dock do you open for the tide of the day?—We open every tide, but we lock in.

1046. You do not open at neap tides, do you?—No.

1047. What is going to happen to a ship longer than 450ft.?—She would have to go in on the level, but you will notice that I refer to some pumping that we do at the entrance. We have two large old-fashioned scoop wheels, which raise something like 30,000 tons an hour. That gives us an increase of level of 1ft. 6in. during the two hours at the top of the tide for the purpose of keeping the proper depth of water when deep draught ships are in the dock, but that does not lengthen the lock, nor does it facilitate the docking of large ships.

1048. And from the 450ft. you have to deduct something for the swing of the gates and the necessary margin?—About 20ft.

1049. Therefore your limit would be 430ft. unless you opened on the level?—That is so, but we get a level, I suppose, two tides out of three.

1050. Have you any additional land adjoining the Millwall Docks available for any purpose?—We have 58 acres of land on the Cubitt Town side.

1051. That is to the eastward?—To the eastward.

1052. But that land is separated by the road and the railway?—There is a road, but our original Act gave us power to carry the dock through Blackwall Reach over that land, and it was for the purpose of the extension, or, rather, of the larger dock, that was then proposed, that that land was acquired.

1053. Have those powers expired?—Practically, yes.

Mr. F. A.  
Duckham.  
15 Nov. 1900.

Mr. F. E.  
Duckham.

15 Nov. 1900

1054. Then, in order to extend the dock in that direction, you would have to divert the road and the railway?—That is so, but the directors now have a scheme for utilising that land, not by extending the dock upon it, but by converting it into a timber yard, and putting there machinery by which they will be able to take timber very rapidly from their present quay side and from the ships in our present dock, and put it on to that land.

1055. Do you do a large timber business?—We do about 10 per cent. of what comes up the river.

1056. 10 per cent. of the total?—10 per cent. of the total coming into the river.

See 979.

1057. I was rather struck with a statement in your evidence that you had to begin locking at half tide?—That is so.

1058. With the limited amount of depth on your sill that appears to mean that you begin at half tide for the purpose of accommodating the barges?—That is so entirely.

1059. And with the limited amount of depth on your sill, I suppose for ships you would only be able to use the lock for perhaps an hour before and an hour after high water?—Yes, perhaps about three hours at the top of the tide. We do not like to lock after high water, because of danger in docking a ship on a falling tide; but we lock for about three hours at the top of the tide, and we find that that is certainly doing all that the ship work requires.

1060. Three hours instead of six hours?—Instead of six hours. The other three hours are spent entirely in letting barges in and out. The barges come and make fast about the entrance, and we have to clear the barges in and out before tackling the ordinary ship work of the tide.

1061. Does it not follow that if the amount of dredging that you have to do is strictly proportioned to the number of hours during which the gates are opened, then half the quantity is due to the barges?—That is so; it is rather more than that. You will follow what I mean. If we are working the lock at half tide the quantity of water that is locked out from the dock would be very much greater than if we were working the lock only for three hours at the top of the tide. In the one case we throw out half a lock full of water, and in the other we throw out only a quarter, or less.

1062. The amount of dredging, therefore, would vary with the depth of water as well as with the number of hours?—That is so.

1063. Has it ever been considered by your company whether the railway should be diverted?—It was an old scheme to take it down on the western side of the island and to follow the river bank away to the eastward side, but it was considered desirable to adopt the same route that we have now.

1064. We have heard that it is highly inconvenient to the East and West India Docks that you should go across?—That is so, but we say that it is a very great inconvenience to us that the dock should be there, because it stops the trains.

1065. The dock was made before the railway, was it not?—That is so.

See 992.

1066. You say it is very difficult to make these or any docks in London remunerative under the present conditions of the trade of the port. Would you a little enlarge on that statement and tell us what you have in view as to the difficulties of making the dock remunerative?—If I may confess it, those were not my words, but I have adopted them. The difficulties we have found at Millwall and the other docks too are these:—First of all, I think it is only due to those who have been connected with the docks for a great many years to say that if anybody knows how to handle and work the docks they certainly do. We have been struggling (and they have been struggling at the other docks too) year after year to make both ends meet, and we have scarcely done it. Something may be done to help in the matter by having better machinery—machinery which will work with less reliance on manual labour. In that way the profits may be increased, and that is what we are trying to do with the arrangements that I was speaking of just now; but apart from that there are other things connected with the trade that make difficulty. For instance, this matter of dealing with the barges is one of great importance to us because we are dealing with goods, and we are dealing

with trade, and we are spending money for which we do not get one penny in return. Whether it ought to be in the shape of charges on craft or otherwise I am not prepared to say.

1067. Apart from finance, are there any special circumstances of a physical nature which render it difficult to work the docks in London at a profit?—No, I think not. I am, moreover, of opinion that the docks have already sufficient water area for their trade, but improved appliances and methods are required for dealing with ships and their cargoes, so that a vessel at present occupying a week in dock may be turned round in three days. This would practically double the capacity of the docks, and be an enormous advantage to ship-owners.

1068. Who works the railways round the dock?—The Millwall Dock Company do their own haulage round the dock. All our domestic haulage, if I may use that expression, is done by our own engines. We have seven engines there. The goods, which are loaded up in Millwall Docks are collected by the Millwall Dock engines, and taken to the Millwall Extension Railway at the north-east corner of the Millwall Docks. They are then hauled by the West India Dock authorities (that is the London and India Joint Committee) engines from the Millwall Dock boundary to the Millwall Junction at Poplar. There they are handed over to the several railway companies on the sidings at Poplar. So far as passenger service on the line is concerned, it is all worked under the Millwall Dock Company. We have our own engines and carriages for running on that line, and the receipts from passenger service are divided between the Millwall Dock Company, for their portion; the West India Dock Company for their portion, and the Great Eastern Railway (as to the piece at the south-east corner of their docks down to North Greenwich) for their portion. It is divided according to the mileage.

1069. Do you find the rolling stock?—Yes. The trains run every quarter of an hour each way.

1070. For your docks who takes the ordinary terminal allowed by railway companies for terminal services?—The Millwall Dock Company.

1071. For instance, take grain going from here to say, Birmingham, there would be a terminal conceded out of the gross rate?—Yes, the Millwall Dock Company receive the rate from that line on all goods coming to their dock.

1072. Up to the north-east corner?—Yes.

1073. Is that a mileage proportion?—No. In that case we should take the full toll on the goods that come through here; we get 2s. a ton payment for goods out of the dock.

1074. For all the services you render?—For all the services we render. Out of that we have to pay the Joint Haulage Committee for haulage through their dock, and for their toll.

1075. How much is that?—It amounts to 8d., including our haulage.

1076. (Mr. Ellis.) Have all the railways that have access to the other docks, the East and West India Docks, access to your docks?—They have over the Millwall Extension Line. They have no running powers over the Millwall Extension Line, but they hand over the traffic at Poplar, and it is brought over the Millwall Extension Line. See 11570

1077. (Sir John Wolfe-Barry.) I see this line belongs to the Great Eastern according to the colouring on the map, but you say it does not?—The Great Eastern are interested in it to some extent. The Great Eastern made one portion, the Millwall Dock made another, and the West India Dock made another. This leads to a very complicated apportionment of profits.

1078. What is the present condition of repair of the Millwall Dock. Speaking generally, has it been kept up?—No, certainly not.

1079. Is there a considerable sum of money required?—At the present time, yes.

1080. Can you give us any idea how much money has been in contemplation as required to put the Millwall Docks in a thorough state of efficient repair?—Well, it is something like £40,000 a year that we want for a year or two.

See 2812-18

1081. That is £40,000 a year, but how much capital expenditure?—The estimate has been about £50,000 or £60,000 to make up for leeway.

1082. That is quite apart from any improvement?—Quite apart from any improvement, and quite apart from the ordinary work which ought to be done. There are buildings which have been demolished, and which ought to be rebuilt; roads which are impassable almost, and there are warehouses which want pulling down and rebuilding. Some want large repairs done to them. Then, again, there are repairs to machinery wanted.

1083. Would it be correct to say that the Millwall Dock is certainly deteriorating at the present time for want of money?—That is so. That was especially so till about two years ago. Since that time we have practically paid no dividends to the shareholders at all, and we have spent in repairs and maintenance the money which would otherwise go for dividend.

1084. There are certain special reasons connected with the Millwall Docks Company which we need not go into now, why you have stopped the payment of dividends?—That is so, but dividends would be payable if we worked on the same lines as before in respect of revenue; that is to say, if every penny earned was paid out in dividends; but the directors now, very wisely, I think, consider it necessary to make the dock in a fit state to live, so as to earn dividends in the future. At present it is very much starved.

1085. Then you think after a term of years you may once more begin to pay dividends?—Well, my hopes are in that direction.

1086. But that expenditure that you have indicated would not deal with any such question as the question of improving the access to the river?—No.

1087. That would be a very expensive affair?—That would mean £100,000, or £70,000 at all events.

1088. To deepen and lengthen the lock?—Yes.

1089. (*Sir Robert Giffen.*) You pay dividends on debentures and debenture stock, although you do not pay dividends to the shareholders?—Yes, we do pay dividends on debentures and debenture stock—£24,500 a year.

1090. (*Sir John Wolfe-Barry.*) Your whole system is dependent on one lock?—That is so.

1091. Therefore you are placed in a somewhat critical condition if you do not keep up the repairs of that lock?—Yes.

1092. (*Sir Robert Giffen.*) What is your total capital?—£2,094,157.

1093. And the debenture capital?—The debenture capital is £503,457.

1094. So that you have one and a half million at the present moment receiving no dividend?—That is so.

1095. (*Sir John Wolfe-Barry.*) Do you happen to know whether that amount of capital represents cash?—Do you mean whether it has all been received in cash?

1096. Yes?—I do not know about that. There were some financial arrangements, I believe, at the beginning of the company, but it was before my connection with them.

1097. We must not take it for granted that that is money expended?—No, I do not know what can be said about that.

1098. (*Chairman.*) Have you made any calculation as to what extra cost the company is put to in consequence of having to let the large number of barges in, in the way you have mentioned?—Not such a very close calculation.

1099. In the way of dredging, for instance?—In the way of dredging, I should say that quite three-fourths of our dredging is due to that. Our dredging during last year I have as £4,186.

1100. Then three-fourths of that would be about £3,000 a year?—Yes, about 3,000 a year. I may conclude my evidence by saying that the principal firms

and shipping lines using the Millwall Docks are as follows:—

*Mr. F. E. Duckham.*

15 Nov. 1900.

Firms.	Trading with—
Bailey & Leatham	Adriatic ports, Baltic ports, and Mediterranean ports.
W. E. Bott & Co.	Christiania, Gothenburg, Riga, Stockholm and Norrköping, and occasional boats from other ports.
Cayo Line (Cuban S.S. Co.)	New Orleans and West Indies.
Elder, Dempster & Co.	Montreal and New Orleans.
R. McAndrew & Co.	Spanish ports.
Paul & Shellshear	St. Petersburg (Red Cross Line).
Westcott & Laurance	Black Sea, Danube and Mediterranean.
Andersen, Becker & Co.	Stettin, and casual vessels from German and Baltic ports.
Phillips & Graves	Gothenburg, Stockholm and Norrköping.
Tegner, Price & Co.	Copenhagen and Libau, and occasional boats from Baltic ports.
Thos. Wilson & Co.	Baltic ports.

In addition to the foregoing, there are many casual vessels trading from North and South America, European, Mediterranean, Black Sea, and its tributary ports, which use these docks.

1101. Are you able to speak to the tables you put in?—Yes.

See 961.

1102. Then we will go through them?—The statement contained in Table 1 was got out with a view of arriving at the proportion of goods sent by craft alongside. We have taken it for the last nine months, because that was within range, and we could get the information which for a more remote period we should not be able to get. These are vessels loading outwards in the Millwall Docks from January 1st to September 30th, 1900. The total tonnage of cargoes of 350 vessels loading outwards (exports) for the nine months was 250,077 tons. Of this tonnage 25,759 tons were taken off the quays, and 224,318 tons were taken on board direct from craft. Then with reference to vessels which came into the docks with cargoes, I might say that 630 vessels came into the docks with cargoes, and the weight of their cargoes was 936,614 tons. The total landed out of that quantity, including 40,654 tons landed on the London clause and on ships' account, was 390,751. So that out of those vessels there was a tonnage of 545,863 delivered over-side direct into barges, upon which the company received nothing whatever.

See 2312-18.

1103. (*Sir John Wolfe-Barry.*) If those quantities had come in by rail you would have received 1s. 4d. per ton?—It is a varying scale—2s. for grain, 6d. for coal, 1s. for minerals, and so on.

1104. (*Chairman.*) Do you charge anything for goods landed on the quays and then taken from the quays by lighter?—Yes.

1105. But only a small proportion, as I understand, is landed?—About 40,000 tons for the period to which I have just referred.

1106. (*Sir Robert Giffen.*) How does the number of 630 vessels with cargoes compare with the number of vessels which came in in ballast?—There are 630 vessels there which came in with cargoes, and 350 loaded outwards; that is 980. The total number of vessels that came in during the nine months was 1,066, so there would be a difference there of about 88 vessels which have to be accounted for otherwise. Some of those would be coasters, of which we do not take account in these figures; some would be perhaps vessels to go to dry dock, and some would be vessels for other than the purposes of this statement.

1107. I wish to know, as a matter of fact, how many vessels come in in ballast as distinguished from the number of vessels which come in with cargoes?—There are very few that come in in ballast now. We get them now and then. The 630 and the 350 overlap each other to some extent, because some of those are vessels that came in with cargoes and went out with cargoes.

1108. If 1,068 came in altogether and only 630 with cargoes, the others must have come in without cargoes or in ballast or in some other way?—We can get those figures more precisely.

Mr. F. E.  
Duckham.

15 Nov. 1900.

1109. (Sir John Wolfe-Barry.) What is the nature of the outward cargo chiefly from Millwall Docks? Is it mixed cargo?—In the majority of cases it is a mixed cargo by vessels which trade regularly between the Millwall Docks and St. Petersburg, the Baltic ports, and the Mediterranean. During the Canadian season we have vessels loading at the docks for Montreal. Sometimes they and others take a large quantity of Portland cement, but, generally speaking, it is general cargo which is sent out.

1110. The staple cargoes inwards being grain and timber, and the outward cargoes being general?—Yes.

One thing I should like to point out to you with regard to the charges on barges, contained in Table 6 which I put in, is that the schedule refers to the penny per ton gross that we can obtain for barges under a few special circumstances.

1111. (Chairman.) How does that work? Do you get much revenue from them?—The total revenue that we have received for the six months ending 30th September is £163, so it represents £326 per annum.

1112. (Sir John Wolfe-Barry.) Are the charges strictly enforced?—Yes, when we can do so.

1113. (Chairman.) Is it worth while enforcing them sometimes?—Yes. If we did not enforce these charges we should have the barges lying there for an indefinite period. We give them 72 hours from the time they have finished loading to get out of the dock. There are various rules and regulations which show when we can charge the penny per ton.

Mr. JOHN TROTTER called and examined.

Mr. J.  
Trotter.

1120. (Chairman.) You are Chairman of the Millwall Dock Company?—Yes.

1121. How long have you been Chairman?—Since July, 1899.

1122. Did you obtain an Act last Session?—It was obtained before I joined the company.

1123. But perhaps you can speak to it?—Yes.

1124. (Mr. Ellis.) You came last year for a consolidating and regulating Act respecting your finance?—Yes.

1125. The Act of Parliament of last year is your authority now as regards finance?—Yes.

1126. You have perhaps heard Mr. Duckham speak about the reason why you were going to ask a subsidiary company to make certain works?—The company has practically exhausted its capital. I think there is about £6,000 not yet expended, and there are borrowing powers to the extent of £40,000. Beyond that it has no resources of its own. The Board are not disposed to go quite up to the limit, in case we should require that sum for any special purposes that might arise unexpectedly, and therefore it is deemed advisable in the scheme that we have for improving the docks to have it done by another company.

1127. Turning to the figures that are given at the end of Appendix 7, against the Ordinary Stock you have £700,000 authorised and £590,000 received?—Those figures were correct at the passing of the Millwall Dock Act of 1899. The Act, however, provided for the issue of a further £51,000 Ordinary capital stock at par to the late Directors of the Company; that amount has since been subscribed for, and paid up in full by them. The total amount of Ordinary stock, therefore, now issued is £660,700. Turning to your question, the Stock is so depressed that it would be impossible to issue it at the present time.

1128. That is what I was coming to. It is not quite unexhausted powers: it is exhausted credit?—Yes, that is so really.

1129. Then with regard to the total received there would be £51,000 to be added to the £2,043,157, making £2,094,157. Have the sums that go to make up that total actually been received?—Yes, those sums have been received.

1130. I will put it in this way:—Does any stock that has been received at a discount appear in your books?—I believe there was a sum of £100,000, that was paid as commission for issuing and guaranteeing the issue of the original capital.

1131. Then of this £2,094,157 everything has been received in cash, except about £100,000?—Yes, as far as I am able to state.

1132. And all that has been spent?—There was a sum wrongfully spent amounting in round figures to £230,000 prior to last year, which was not spent on improvements of the dock. It was distributed in dividends, and the expenditure was afterwards authorised by the Act of 1899.

1114. And you only get £326 from the barges in that way, whereas they cost you £3,000 a year to get them in?—That is so, £3,000 in addition to a large share of Dock Master's and other expenses.

1115. (Rear-Admiral Hext.) With regard to the dolphins, you stated that they were placed there for the convenience of discharging grain from ships into lighters?—Yes. See 2815.

1116. And therefore to a great extent they are placed there for the convenience of lighters as well as for the convenience of ships?—Yes, that is so—grain and general cargo. I may say that the first dolphin we made at the dock was for discharging iron ore. We had a number of vessels from Spain with iron ore, and we found a dolphin a convenient way of discharging. That was developed afterwards for the convenience of grain ships, and those bringing general cargo to the docks.

1117. Are many ships detained in the dock after loading from want of water on the sill?—No. They manage their loading so as to get out before the neap tides come on.

1118. (Mr. Ellis.) One question with regard to finance. You came to Parliament last year for a kind of consolidating Act. That regulates your finance, I suppose?—I had rather Mr. Trotter, our Chairman, dealt with that.

1119. I asked you about a subsidiary company, and I rather understood from you that you had exhausted your powers?—Mr. Trotter can speak to that also better than I can.

1133. Then we may take it that £1,764,157 has been spent on the property?—Yes, if that is the difference.

1134. (Chairman.) Now I want to ask you if you have any general statement to make. In the evidence of Mr. Duckham he puts in this paragraph, "It is, however, very difficult to make these or any docks in London remunerative under the present conditions of the trade of the port." Have you as chairman any suggestion to make for the improvement of the trade of the port?—The barge question is a very serious one. It entails great expense, and takes away a very large amount of goods that otherwise would come to the dock, and we get nothing for it. See 994.

1135. Is that the only part that you think requires alteration?—I think there are a great many improvements capable of being made in the Millwall Docks which the present Board is endeavouring to carry out to the best of their ability, as is evidenced by this plan that we have got increasing the granary accommodation, and providing timber accommodation on the land at present unused. Those improvements would materially affect the condition of the company if carried out. See 2815-18; 7108.

1136. But do you think that under present conditions you are likely to be able to carry them out?—Yes.

1137. In what period?—I do not know how long it would take actually to carry the works out, but I should think within a year or two years certainly.

1138. Then you are not in favour of a general trust for the river?—One does not want to be exterminated.

1139. I want to know whether you have sufficient vitality in you to enable you to keep going on?—I think there is a sufficient amount of vitality in us.

1140. (Sir Robert Giffen.) Can you tell us the market value of the different stocks that your company has issued?—In considering these values the Commission will understand that the Millwall Dock Company is not at present in its normal condition. It is naturally very much affected by the disasters that fell upon it prior to 1899. The 5 per cent. Debenture Stock is now at about £133; the 4 per cent. Debenture Stock is about £105; the 5 per cent. Preference Stock is about £96; the 4½ per cent. Preference Stock is about £71; the New 5 per cent. Preference Stock is about £62; and the Ordinary Stock is about £22.

1141. What is the aggregate market value of all those stocks put together?—£1,567,851.

1142. Against a capital of £2,094,157?—Yes.

1143. And against an actual expenditure of £1,700,000 or thereabouts?—Thereabouts.

1144. You have not put in any statement of your income and expenditure?—I have the balance-sheets that have been issued since the new Board took charge. The balance-sheets prior to that are not reliable.

1145. But those balance-sheets are half-yearly balance-sheets?—Yes.

See 7037.

1146. We should like the statement of income and expenditure annually, to compare with the other figures that we have got from the Joint Committee?—For the last year do you mean?

1147. Yes. I think that should be prepared for the Commission so as to have it on the same basis.—I will have that prepared.

1148. I should like to ask you with reference to the first item of your income in the revenue account. You put together the import and export rates and tonnage dues and rent from goods and shipping. I should like to ask you if you could put that in the same form as the Joint Committee have given it us. They divide theirs into import and export rates and tonnage dues. Can you give us the same classification?—Yes, that shall be done.

1149. Could you tell us what the tonnage dues on shipping are?—No, I could not tell you offhand.

1150. But you can give us the same classification?—I can put it in the same form.

1151. Could you separate the warehousing from the other business?—I cannot say. I should hardly think we could. It might be possible to do it; if it is I will have it done.

1152. (Chairman.) If you deducted the dues the residue, I suppose, would be mainly warehousing, would it not?—It would take a considerable time to get it done, but if it is possible I will have it done.

1153. (Mr. Ellis.) One question of general policy. Mr. Duckham in his evidence said: "It is impossible

for the company to alter these"—that is the sills—"and the existing channel of the River Thames may therefore be said to be sufficient for the particular requirements of the Millwall Docks." Now assume that you could alter the sills, and assume that the channels were deepened, would it benefit your company?—We could, of course, take in vessels that we cannot take in at present, but as things stand at present we have quite as much as we require to fill the dock. It would undoubtedly be an advantage if the sills were deeper in case we wished to take in other vessels, but at the present moment we have quite as much to do as we can manage without having these large vessels.

1154. Do you think, looking to the future and the requirements of commerce, it would be an advantage to you?—Undoubtedly it would be an advantage to be able to take any vessel that would come to us, instead of having merely to take those that are not of the largest size.

1155. (Chairman.) I presume you agree with the Engineer that 24ft depth would be better than your present depth?—Undoubtedly.

1156. Though not absolutely necessary?—It is not necessary at present, and since I have had experience of the dock we have had no difficulty on that score at all. We have had difficulty in regard to certain large vessels that would have come to us if we could have taken them in, but it was not a very serious one.

1157. You have no further suggestions to make?—No. I have no other evidence to put in.

Mr. J. Trotter.

15 Nov. 1900.

Recalled 7036.

Mr. JOHN INNES ROGERS called and examined.

1158. (Chairman.) You are Deputy Chairman of the Council of the London Chamber of Commerce?—Yes, and in that capacity I desire to submit the general statement of evidence adopted by the Council, and I also wish to formally hand in a return comparing the dock charges at various ports. Mr. Coke will, however, deal with the tables in this return.

(The Witness handed in a return showing a comparison of dock charges at various ports. See Appendix, 4th day, No. 8.)

1159. We wish you to understand, of course, that we are very much obliged for the trouble you have taken in collecting this information, which will be very valuable to us, but we cannot accept it as incontrovertible evidence?—Do you mean these tables?

1160. Yes, unless they are supported. As far as London is concerned, of course, you may be able to support them?—I think Mr. Coke will be able to give you full evidence as to the care which has been taken in drawing up the figures. In each case they have been compiled by practical people, and they have been checked by each trade as well.

1161. The difficulty is that there is a certain amount of evidence with regard to other ports?—I think they are actual rates, collected and compared.

1162. We shall be glad to know exactly what the evidence is?—If the dock companies question any of them they can be gone into.

1163. (Mr. Ellis.) You must remember that the Report of a Royal Commission comes before Parliament. Members of both Houses of Parliament know that all the evidence has to be taken according to the Rules of either House, and one of the Rules laid down is that you must have evidence at first hand. This is information, not evidence?—I understand.

1164. (Chairman.) As I said at our last sitting we cannot take second-hand evidence unless you can show us exactly where your evidence comes from. The same thing applies to this?—We shall be able to tell you where the evidence comes from.

1165. (Mr. Ellis.) That is not quite enough?—If you wish that some one person should take an oath as to all these figures it would be impossible. We only depend on the general result.

1166. (Chairman.) You put this in as your view. It is very valuable information, but it is not absolutely incontrovertible?—They are the official rates in each case taken from the various dock books.

1167. You must prove them?—Mr. Coke will take that portion of it.

1168. We are very much obliged to you for taking the trouble of preparing this information, but we are bound of course to get the very best evidence we can?—I understand.

1169. (Mr. Ellis.) If we were to found a statement in our Report on figures given secondhand, it would vitiate the figures at once for Parliamentary purposes?—I understand. I wish to place the statement of my evidence before you as our general statement of the case, and I wish to be cross-examined upon it. This statement has been modified in order to suit the many interests represented in a body such as the London Chamber of Commerce. Shall I read it paragraph by paragraph?

(Chairman.) Yes, perhaps you had better. There may be points in it which raise questions of future policy, which will have to be reserved till we are prepared to receive them.

1170. (Mr. Ellis.) In the first place I think it would be convenient to have on the notes exactly what the London Chamber of Commerce is?—It is an association of mercantile men, shipowners and others in the Port of London, consisting of nearly 4,000 members. Our main business is, so far as practicable, to promote the trade of London and, after that, to promote the general trading interests of the country.

1171. It is an incorporated body?—Yes, it is an incorporated body.

1172. (Sir Robert Giffen.) Who is the Chairman now?—The Chairman is Mr. Blackwell. He will give evidence before you on special matters which interest him. I appear because I have a more general knowledge of the custom of the port than he has. Our President is Mr. Sandeman of the firm of Sandeman and Sons. I should say that this statement of evidence was drawn up by, or it has passed the ordeal of, the Special Committee, who are more or less specialists in this subject; and it has been passed by the Council of the Chamber of Commerce at a very full and long meeting where the general principles were considered. Therefore this is the official utterance of the London Chamber of Commerce.

The London Chamber of Commerce has for a number of years viewed with anxiety and increasing alarm the gradual diminution in some branches of trade in the Port of London—

1173. I should like to ask a question at this point. What branches of trade do you allude to?—Transshipment for one, and re-export of foreign and colonial produce. In my own trade, which I can speak to, that is the sugar trade—which has left London—

1174. In what way has the sugar trade left London?—It is imported into other ports. When I said the sugar trade I meant the general sugar trade. It is imported through other ports to railway and similar centres all over the kingdom.

1175. But the actual trade for London is what it was before?—Yes, except what comes by way of Southampton and the other railway ports. They attribute this

Mr. J. I. Rogers.

Mr. J. I.  
Rogers.  
15 Nov. 1900.

diminution, in some branches of the trade, to a variety of reasons, among which may be given the decrease in the price of commodities, which has rendered economies in distribution essential, and has caused direct importations to other ports both within the kingdom and abroad. The opening of the Suez Canal has also had, as was anticipated, a great effect by diverting supplies formerly sent to England and then re-exported. Submarine telegraphs and quicker methods of communication, coupled with the increase in the number of standards of quality, and the system of forward purchases, by which goods can be dealt in without samples, etc., have also affected the trade of London. If it is desired that I should explain that more at length, I would say that goods have been very much more standardised, so that now you sell goods by number, or by average quality, or something of that sort, and it is no longer necessary to see the goods themselves.

1176. May I ask you what goods that formerly came to London have been diverted and are not re-exported as they used to be?—Coffee very largely, wool, I believe cotton, tea in some cases, and spices. I am speaking more of my own trade, where I know it perfectly.

1177. Will you give us your particulars afterwards?—I believe those would have to be compiled by the Customs.

1178. (Chairman.) You say cotton. Cotton never came much to London except for re-exportation, did it?—No. I was speaking more generally of the kingdom then. The Suez Canal affects that sort of thing.

1179. But since the Suez Canal has been open cotton has gone direct to the Levantine ports?—Yes. The argument that this is leading up to is that we acknowledge that there are these general causes at work, but the state of the Port of London has aggravated it instead of helping. As a result of these and probably many other causes the old system under which large mercantile houses imported goods into London in heavy quantities, stored them in the docks, and then held them for a favourable market, has almost entirely died out. London has to some degree ceased to be the *entrepôt* of the world, and its trade is increasingly confined to local business. Outports have gained proportionally, as compared with London, in supplying our own country. Then the next head is "Defects of the Port of London." While these general causes have, no doubt, seriously affected the trade of London, their operation has been greatly aggravated by the bad system which prevails in the Port of London, both as to ships and as to the steorage and delivery of goods for home use and export. Above all, London has suffered by the excessive charges levied upon goods in this port, and by the insufficient facilities for conducting the trade on an improved basis.

(Chairman.) That we should like to have more in detail.

(Mr. Cater Scott.) My Lord, may I interrupt? This gentleman is entering on controversial subjects. At your request I have kept back my evidence. These matters that this gentleman is dealing with are matters of vital importance not only to myself as Chairman of the Joint Committee, but to all the dock companies.

(Chairman.) We cannot allow anybody from the body of the room to interfere with the evidence that is being given. If you have anything to state you may state it in writing afterwards. You must not interrupt a witness.

(Mr. Cater Scott.) Shall I have the opportunity of dealing with it afterwards?

(Chairman.) You are bound by the decision which you have heard read, and that ought to be sufficient to meet all the cases which you mention.

(Mr. Ellis.) We must not have anybody interrupting.

(Chairman.) It is quite out of order for anybody to interfere. You must not interfere at the present moment between the Commission and a witness whom they are examining.

(Mr. Cater Scott.) I am very sorry, my Lord.

(Chairman.) You are quite out of order.

(Witness.) With reference to corroborating that general statement as to excessive charges, our committee at very great expense and labour has compiled this return of 93 pages of the rates in the named ports of the United Kingdom as compared with London. Those rates will be entered into in detail by the witness who follows me, Mr. Coke, who has been mainly responsible for them. They are compiled as far as practicable—and I believe in every case—from the official dock books of the various ports. Also they have been reduced to a common deno-

minator for the purposes of comparison, and they have been checked, not only by the special experts whom we have engaged for the purpose, but by specialists in the different trades interested.

1180. That does not answer my question with regard to the first part of this paragraph. You state that the defects are "aggravated by the bad system which prevails in the Port of London both as to ships and as to the storage and delivery of goods for home use and export." I should like to know what you mean by that?—I can deal with it in great detail if necessary.

1181. We want to know what the facts are?—As regards the defects of the port, as a port, I think the evidence which your Lordship has heard from the Thames Conservancy and also from the various dock companies is perfectly sufficient for our purpose.

1182. What we want to know is what from your own knowledge is the present state of things with regard to the trade of the Port of London. We do not want merely a general statement. We only want you to put in facts which you know of your own knowledge as a body?—We know these facts; that in the first place the docks in London are conducted in the interests of shareholders, instead of in the interests of the general public.

1183. That is a fact which we all know, but we do not want to enter into any questions as between the Chamber of Commerce and the Docks?—We then hand in these tables in great detail to show what we believe the comparison of charges to be. We then complain of delays in berthing ships and discharging ships. I can give you facts with regard to the latter point.

1184. Any facts with regard to delaying ships is a matter which ought to be laid before us in the first instance?—And insufficiency of the method of dealing with traffic, want of co-operation with the railways, and so on. I can give you a case in our own trade. We import a great deal of salmon from Alaska and British Columbia. We send that in sailing ships, in some cases to London, and in some cases to Liverpool. We find that in Liverpool the ships can be unloaded in from two to three days. In London they take the same number of weeks. The average time they take to unload these ships is as much as four weeks in London, instead of a similar number of days in Liverpool.

1185. You had better furnish us with the exact evidence on that point. We must have somebody to show that?—I think the shipowners will show that.

1186. We shall be very glad to hear any evidence of that kind?—Would not this be admitted as controversial matter for enquiry simply?

1187. All these matters are liable, at some future time, to be used as matters for cross-examination. These statements are subject for cross-examination if they are controverted statements. What we want you to state at present is what you know of your own knowledge, or what you are prepared to prove as the Chamber of Commerce. Perhaps you had better not go on any further with this point except that you have stated a case from your own knowledge?—I can state also from my own knowledge that I am fully aware of the fact that the charges in Liverpool are very much lower than in London, because we have a branch house in Liverpool.

1188. (Mr. Ellis.) You are speaking now not as Deputy Chairman of the Chamber of Commerce, but as an individual?—As an individual. I have a great deal of evidence of that description here, but our idea was that you wanted the general opinion of the merchants of London as to this question.

1189. Before leaving this point, I should like to ask one general question on this paragraph. This statement of yours is partly argumentative and partly recitative. For instance, you describe the position of the Chamber of Commerce?—Yes.

1190. That is evidence. Then you make very broad general statements. The question I want you to answer is this:—Do you come here greatly aggravated by the bad system which prevails in the Port of London. Do you come here as a witness, the Deputy Chairman of the London Chamber of Commerce, prepared to substantiate hereafter by facts and figures that general allegation that you made?—I think so.

1191. By evidence at first hand?—I think so.

(Mr. Ellis.) This is more or less a counsel's statement; it is not evidence.

1192. (Chairman.) As I understand, this document has been passed by the Chamber of Commerce, and, as such, as a general statement we can receive it as the opinion of

See 7009.

the Chamber of Commerce, but any statements they make, if they are to have any weight, are liable to cross-examination, and must be supported by direct evidence?—We have evidence coming forward. We have forty witnesses coming forward, and I think you will find this will be established in detail. I acknowledge that this is a statement of opinion.

1193. With regard to your own experience, you can state that, independently of the opinion of the Chamber of Commerce. You might now go on?—The London Chamber of Commerce has made several efforts to approach the Joint Committee upon this subject. I can give you two cases—tobacco and coffee. We endeavoured to approach them, and we were told unofficially that it was no use, and therefore we gave it up. Our representations have not always been received in a friendly spirit.

1194. (*Mr. Ellis.*) Is it worth while your coming from a public body to make these statements? You open out such a controversy if you say they refused point blank. We shall have everybody here. Is it worth while to make these statements from your own point of view?

(*Chairman.*) I think we are bound to receive the evidence of the Chamber of Commerce, whether it is right or wrong. They put it in.

(*Witness.*) Our desire was to act with the docks in as friendly a manner as possible. We endeavoured to approach them, but we felt ourselves more or less rebuffed.

1195. That, of course, is a matter for proving, or it will be a subject for cross-examination?—In the year 1896 an attempt was made to introduce generally a system analogous to that which had been introduced by shipowners in the North American trade, by which all goods entering the docks have to be placed upon the quays, and are there sorted out. Under this system a charge is levied of from 1s. 6d. to 2s. per ton—

1196. Is it levied, or was it proposed to be levied?—It is already levied, and they proposed to extend it to all goods. Under this system a charge is levied of from 1s. 6d. to 2s. per ton upon all goods discharged, whether lightered or delivered from the quay. When this proposal was brought forward the London Chamber of Commerce convened one of the largest and most enthusiastic meetings of merchants and wharfingers ever held in the City of London, and the agitation was so great that the proposal was withdrawn. Subsequent to this meeting no special development took place until the Dock Company suddenly imposed charges upon sailing barges in 1898.

1197. Perhaps you will be able to put in as evidence a certified report of that meeting. That is absolutely necessary before we can receive it as evidence?—Very well, my Lord. The Cement Section of the Chamber promptly took the matter up, inviting the co-operation of other sufferers. An action was brought on the 31st July, 1899 (*Burham Brick, Lime and Cement Co., v. London and India Docks Joint Committee*) before Mr. Justice Mathew, when judgment was given against the Docks Committee, whereupon the recent proposal of the allied companies to impose new charges was brought before Parliament, and negatived on the second reading, with the result of the appointment of the present Royal Commission on the Port of London.

1198. Again, you will have to put in the report of that judgment of Mr. Justice Mathew?—The next witness will put that in.

1199. (*Mr. Ellis.*) You say, "brought before Parliament and negatived on the second reading." You must say before which House of Parliament it was brought, and the date. You must give the whole story if you make a statement of that kind?—It was last Session.

1200. We shall want the date. It is not sufficiently precise?—In offering the following general evidence it must be distinctly understood that the London Chamber of Commerce is not in the least degree inimical to the Dock Companies. The Chamber, on the contrary, sincerely regrets that, owing to changes in circumstances, the position of the allied companies, from having been one, for many years, of extraordinary prosperity, has become one of financial embarrassment. The Chamber only challenges the advisability of the changes proposed by the allied companies, and thinks they are altogether inadmissible, particularly while there are remedies for the existing depression which have not been tried, and which the Chamber believes might improve matters, or even solve the difficulty, so far as the finances of the docks are concerned.

1201. (*Chairman.*) That is a controversial point which

the Chamber of Commerce may apply to be heard on whenever the question is raised?—Yes.

1202. (*Sir Robert Giffen.*) You speak of the dock companies. Does that refer to the Millwall Dock and the Commercial Dock, or to the docks under the control of the Joint Committee?—We call them the allied dock companies.

1203. You are not speaking of all the companies?—No. The allied companies we intend to apply to the docks under the control of the Joint Committee.

1204. Are you satisfied with the other dock companies?—They have not attacked us, but we are not satisfied with them.

1205. (*Mr. Ellis.*) If you make charges against people you must be more precise?—We are not making a charge here; we are simply saying that we believe there are methods of dealing with the question like the Liverpool quay rate.

1206. (*Chairman.*) We do not want to go into that now. That is a question of finance. What we want to know now is the opinion of the London Chamber of Commerce with regard to the present state of things. All controversial points with regard to raising money and so on must be dealt with at the proper time?—Then the statement goes on to deal with the importance of the trade of London. The Chamber is not by any means satisfied with the defeat of the Bill recently introduced into Parliament by the allied companies, for while it is convinced that something will have to be done in their interest if they are not to sink into bankruptcy, what the Chamber is mainly concerned about is the permanent interest of the Port of London. The metropolis is, of course, of special importance to those who trade within its limits, but its prosperity, as representing something like a seventh of the population of the kingdom, and as the financial, social, and political centre of the British Empire, and to a large degree of the world, renders anything which affects its interests a matter of national concern. The maintenance of the trade of London as compared with the volume of business transacted in the United Kingdom and in the world, are thus subjects, not only of anxiety to those immediately concerned, as the Chamber of Commerce is, but to the nation at large. Then the next head is, "Sections of the Chamber of Commerce." As the membership of the Chamber of Commerce consists of nearly 4,000 firms or individuals, it represents very important and somewhat varying interests in London. For instance, some members of the Chamber and of the Dock Charges Committee are shipowners, public wharfingers, owners of private wharves (that is, premises occupied for the interests of the owners in their own businesses, and not for the reception of goods for others), lightermen, manufacturers, and wholesale and retail distributors of goods. All these various sections desire a reform in the system of the Port of London, but they have not in every case the same remedy to propose; in fact, their interests are in some cases divergent. Where these differences of opinion exist, it is proposed by the Chamber that the different interests, although appearing under its auspices, should tell their own tale to the Commission, and propose their own remedies.

1207. (*Sir Robert Giffen.*) Have you any representative of the docks upon the Chamber of Commerce?—We have. A member of our council (*Sir Neville Lubbock*) is one of the dock directors, but naturally he is not taking any part in this matter, though he has heard all that has gone on. Now I come to "Objections to the present system of the Port."

The chief objections to the existing state of things are:—

- (1) Insufficient width and depth of water in the navigable channels of the Thames and in the docks themselves.
- (2) The number of authorities under whom the control of the port lies.
- (3) The difficulty of berthing ships and of loading or unloading them quickly.
- (4) The lightering system of the port with the control through the Watermen's Company.
- (5) The excessive charges of the docks.
- (6) The inefficient appliances in the docks.
- (7) Slowness in delivery of goods, and the centralisation of the dock system.
- (8) Defective communication with railways and canals.
- (9) The financial position of the allied dock companies, which renders reform difficult.

*Mr. J. I. Rogers.*

15 Nov. 1900.

Mr. J. I.  
Rogers.

15 Nov. 1900.

Then we deal with these points numerically. "(1 and 2) Insufficient depth of water and multiplicity of authorities." These points are sufficiently dealt with in the invaluable statistical return compiled by the London County Council, which the Commission have, no doubt, before them.

1208. (*Chairman.*) That is not evidence. It has not been put in as evidence?—I thought that probably, being an official document, it had been.

1209. It has not been officially put before us?—It appears to the London Chamber of Commerce, that the question of adequate depth of water in the channels of the river and of the docks themselves lies at the root of the prosperity of London. Unless the river is so deepened as to admit of the most modern ships, such as the "Oceanic," and also to allow of the berthing of them in the docks—

1210-11. (*Sir Robert Giffen.*) In all the docks?—No, I should not say in all the docks.

1212. In which docks?—I should say the Victoria and Albert. Tilbury is so far away that it is not much good for our purposes. As I was saying, unless the river is so deepened as to admit of the most modern ships, such as the "Oceanic," and also to allow the berthing of them in the docks, the position of London will steadily retrograde, and the sceptre of international trade must pass to Hamburg and to Antwerp, where these things are properly seen to.

1213. (*Chairman.*) Are you going to give any evidence with regard to Hamburg and Antwerp?—There is a return just published by the Foreign Office.

1214. That, of course, we have before us. But you have no further independent evidence, have you?—I have personal evidence as to lower charges in Hamburg as compared with London, which I can produce if necessary.

1215. (*Sir Robert Giffen.*) You are speaking of the size of ships especially now. Have you any evidence as to what the state in Hamburg is, of your own knowledge?—No, I see that the Foreign Office have not given us the depths of the rivers.

1216. (*Chairman.*) No; it is not sufficient for our purpose. It is a very interesting report, but it does not contain all the evidence that we shall require?—It is obvious that the first necessity in dealing with this question is to have one single authority which shall control the whole tidal waters of the Port of London. As it is a matter of life or death to London to have its water accommodation brought up to the level of the age, the London Chamber of Commerce believes that, in the interest of the Metropolis, the work should be undertaken in the public interest, and if necessary, out of a special rate, so far as the deepening of the channels in the river itself is concerned. As regards the docks, so long as they are private institutions, trading only for the profit of the shareholders, no expenditure of public money would be justified; but on the formation of a public trust things might assume a different aspect.

1217. The question of raising funds for any purpose connected with the port is of a controversial nature, and therefore must be relegated to those subjects which must be dealt with in the way we have suggested. Therefore we do not intend to enter upon those subjects now?—Then objection number (3) is the difficulty of berthing ships and of loading or unloading them quickly. It is understood from shipowners that there is very often difficulty and delay in finding berths, or suitable berths, for ships, and this of course is a very serious matter. It points to the dock accommodation of the port being insufficient.

1218. (*Sir Robert Giffen.*) Is that at all the docks—or at which docks?—In the river goods are waiting their turn to get into the various docks. We have had a number of complaints before us from shipowners of the great delay in finding berths for them.

1219. Does that apply in the same degree to all the docks?—I could not say that, but it applies to the upper docks—not to Tilbury.

1220. Does it apply to the Victoria and Albert?—I should say it did.

1221. (*Chairman.*) That, of course, must be supported by independent evidence?—Yes.

1222. (*Mr. Ellis.*) We shall have the shipowners?—Yes, you will have the shipowners. It is necessary to have some general statement, because it is impossible for one witness to know all these facts of his own knowledge.

1223. (*Chairman.*) The Commission are quite willing to receive this as the expression of opinion of the Chamber of Commerce, and as such they receive it, and are glad to receive it?—There are complaints on all sides from importers and exporters of goods of the delay in loading and unloading ships; this points to the want of adequate appliances and also, it is believed, to the want of promptitude and despatch on the part of the dock officials.

1224. (*Sir Robert Giffen.*) Do these complaints apply to the docks of the Joint Committee exclusively?—Yes.

1225. Not to other docks?—No.

1226. You have had no complaints from other docks then?—Yes, but we are dealing with the allied companies only.

1227. But we are asking for information from the Chamber of Commerce as to all the docks, and the state of the river generally?—I should say that it applied just as much to Millwall.

1228. And the Surrey Commercial Docks?—That is a timber dock. I cannot answer that. As regards unloading, the allied companies excuse themselves by saying that a considerable portion of the delay is due to the system of free overside delivery into the barges and lighters, which renders the sorting of goods more difficult. That I believe there is a great deal of truth in.

1229. (*Chairman.*) What I have said just now applies to this paragraph?—Quite so. I think I thoroughly understand. You are simply admitting this as you might a counsel's speech.

(*Mr. Ellis.*) Yes, it is worth absolutely nothing until it is substantiated by evidence.

(*Witness.*) Then objection No. 4 is "The Lightering System." The plan of lighters going up and down with the tide involves very frequently considerable delay when tides are missed. In one way, no doubt, the small number of men required for the navigation of the barges effects economy, but, on the other hand, the uncertainty of the system is very great, and it is a question whether it should not be more largely supplemented by steam. Since the statement of this evidence was drawn up, I observe that in one of the Acts of Parliament governing the Thames the only artificial power provided for is steam. Therefore, if people wanted to use electricity or petroleum it would appear to be illegal.

1230. (*Sir Robert Giffen.*) You do not know that of your own knowledge?—I found it in one of the Acts of Parliament.

1231. (*Chairman.*) You can refer us to the Act of Parliament?—Yes, I can supply that. Again, it is not the custom for lighters to make calls at a number of places for the collection and the delivery of goods, and while the present plan of moving them with the tide continues, it would be very difficult to bring about an improvement. The result is that very frequently the cheap water transport cannot be taken advantage of, because a whole barge load has to be paid for, however small its cargo may be. Apparently it would be advantageous to supplement this system or supersede it by the employment of steam barges calling at a number of places, to collect and deliver goods in the same way that land carriers do. One great difficulty in the way of the reform of the barging system of the Thames is the control of the Watermen's Company. Under an Act of Parliament no one can navigate barges or other vessels on the Thames, or even, it is believed, be employed on one of the steamboat piers on the river, without being a member of the Watermen's Company. As regards the lightermen, the existing system raises the cost of transport upon the river. The wharfingers along the river bank, whether receiving goods for others on rent, or trading in their own goods for their own business, very generally complain that they cannot employ their own people in this work of barging up and down the river. I have had a personal exemplification of that to-day in our own business. There is a lightermen's strike at the present moment in the Thames, and we have a large quantity of dates coming from Persia, part of which have to be transhipped to the Continent. The lightermen have struck: we have undertaken to deliver these goods on the Continent, and we have no means of getting them from the import ship on to the export ship. The lightermen suggested to us that we should employ our own men for the purpose, but I have been reading the Acts recently, and I believe it is absolutely illegal for us to do so, though we have our own men who could do the work.

See  
6638-39.

In the opinion of the Chamber of Commerce, the control of the Watermen's Company should be put an end to, and this is one of the first reforms required in the conduct of business on the Thames. I now come to (5.) "The Excessive Charges at the Docks." The London Chamber of Commerce appointed a special committee to prepare, for the consideration of the Royal Commission, a comparison of the charges in London with those of the other chief British ports. The result I have already handed in. It will be seen from the exhaustive returns given that the charges in London are enormously in excess of those in the other chief ports of the kingdom.

See 1158.

1232. (*Sir Robert Giffen.*) But it is quite open to us to draw the inference that they are not enormously in excess when we come to examine it?—Yes, if you find the figures are wrong.

1233. No, I do not mean that. We may draw a different conclusion, because figures are not strictly applicable always to the same thing, and they require a great deal of consideration?—That is so.

1234. I am merely suggesting that as a point for debate?—Certainly. At the request of the London Chamber of Commerce the Foreign Office some time ago instituted a comparison between the charges in London and the charges in the chief continental ports, such as Hamburg and Antwerp, to see whether the excess of the London charges accounted for the loss of the London transshipment trade. It may be asked how it is that the allied companies with such very high charges are in a bad financial position, while the other public wharfingers of the Port of London are prosperous, although the charges of the latter are on the average below those of the docks, and although the wharves have to pay out of their charges the cost of lightering goods to and from their premises and the docks. In our own trade we have had the figures taken out, and the average charges at the wharves are some 10 per cent. less than the charges at the docks—I am referring to the public wharves in London.

1235. That is warehouse rent?—Warehouse rent, landing, and so on. Goods are brought up by lighter and taken into these wharves and dealt with as they are at the docks, in fact. The lightermen pay the cost of lightering up, and still are able to undersell the docks. That is the point we have in view. The explanation of this seeming anomaly of the financial position of the docks is to be found in the fact that the allied companies, through their excessive charges, have lost a very large proportion of the warehousing trade of the Port of London, which has been transferred to the other public wharves up the stream. As a matter of fact, merchants would prefer storing goods at the docks at equal rates, because there would not be the delay of barging them up to the various wharves. That delay is found very considerable. The cost of the insurance at the docks is also less. With reference to this point of insurance, the allied companies state that their charges are above those of the wharfingers, because this is only equivalent to the extra insurance that people have to pay at the latter places. This, however, is a mistake, as the surcharge is much more than an equivalent to the saving in insurance when policies are taken out on what is called "floating terms." That is a matter of fact. I have worked it out myself. It will be observed that the charges in London when goods are not housed, but simply landed on the quays and then delivered, are enormously in excess of those made for similar services in Liverpool. This points to the great defect of our system in London, viz., the absence of a low quay rate, such as prevails in Liverpool. The Liverpool Dock Board do very little of the general warehousing trade of the port. Warehouses are provided for special trades, such as grain, tobacco, wool, and some of the smaller trades which require expert treatment and accommodation in their general warehouses; but, as a rule, goods are placed on the quay, sorted, and taken away in carts within three days from landing, but frequently, on payment of special rent (and when convenient to the dock managers), time is allowed for sales to be effected, and the goods are taken away by the buyers; payment of inward dues and quay rate being obligatory on the importer. The result is that although the Liverpool docks have little warehousing business, they are enormously profitable, although the rates upon goods have been and are being continuously reduced. The Liver-

pool Dock Trust is managed by a committee mainly elected from members of the actual trades who pay the dock charges. This committee thus consists of practical men actually employed in business, and who gratuitously advance the interest of the port, as well as of their own trade. I should tell you that in our own business we have frequently endeavoured to obtain quay rates on the Liverpool system in London, but we have been refused by the dock companies.

1236. They have refused to give you a quay rate?—They would make you house it, which is the same thing. Directly goods touch the quay for practical purposes they have to be housed. The trade of London has been undoubtedly seriously injured by the heavy secret discounts formerly given off the dock charges at the time of payment of accounts. This diverted a large amount of trade from London, because the agents who received these discounts were in some cases not in the habit of accounting for them to their employers abroad, the result being that the London charges appeared to be far more in excess of other ports than they really were. At length this scandal reached a great height, and, on the facts being publicly mentioned, the Joint Committee took the proper steps, and published the rates of discount in their books; and the amounts at the same time were greatly reduced, after the mischief was done.

1237. At what time was this?—I cannot give you the exact date. It is very clear in my memory, because we were unfortunately sufferers by it in the dry fruit trade.

1238. (*Chairman.*) You will be able to put in the actual date?—Yes.

1239. (*Sir Robert Giffen.*) Is it ten years ago?—Something like that. It would be quite clear on the rates published by the Dock Company.

1240. (*Chairman.*) Your own books would show it if it was only ten years back?—I do not think we keep the books. The old books after a few years are no good, when you have paid the accounts. The Dock Company's rates would show it. They are now put in the book; the discounts are printed. I do not see any object in discounts myself, because if you are going to pay £100, you had better pay £100 and not get £10 back at the time you pay it. It is important to point out that while the tonnage of ships entering in to the allied docks has increased nearly 50 per cent. during the ten years ending 1898, the income from shipping dues has remained almost stationary, and only forms 26 per cent. of the income of the allied companies.

1241. (*Sir Robert Giffen.*) That is to say the tonnage of ships entering in the foreign trade—is not that what you mean?—In the foreign trade.

1242. It does not include all the tonnage?—I am not quite certain of that. The singular anomaly shown by the above figures calls for careful investigation, the more so as, while the London rates are in this respect lower than those of Liverpool, shipowners complain generally of the dearness of London. The dock rates are much more oppressive in some goods than in others; for instance, the rates for tea, in which London has practically no competitor in England, are enormous. For example, they are double as heavy as in coffee, although the average bonded value per pound of coffee is greater than that of tea. I should say not greater, but about the same as that of tea, because circumstances have altered. This is largely due to a combination of the various people interested, and who have formed an association called "The Tea Clearing House."

1243. Does that apply to the wharfingers' rates as well?—That applies to the wharfingers' rates as well, and on the system being recently questioned, the dock companies and the wharfingers attempted to form a pool or combination for seven years—to pool their profits in certain proportions, and apparently to maintain these exorbitant rates on tea to the detriment of the Indian planters and of the home trade.

1244. At what date was that pool?—I have it here, and I can hand it in if necessary. I do not know if it has been concluded. It is dated the 16th August, 1900, and there have been alterations since made from time to time by the Pooling Committee. I should say that the tea trade objected very much to that pool, and I hope it is dropped, but I have no means of knowing. As regards the dock rates generally, it is proposed that the special interests or sections concerned shall give evidence under the auspices of the Chamber of Commerce with regard to the rates on particular goods. We propose to send in 40 witnesses, I believe, to estab-

Mr. J. I. Rogers.

15 Nov. 1900

Mr. J. I.  
Rogers.

15 Nov. 1900.

lish all these rates. (6 and 7): "Insufficient appliances and Slowness of Delivery." There is a general impression, which justifies official inquiry, that the appliances, such as cranes and so on in the docks of London, are much behind those in other ports, particularly in Hamburg and Antwerp. If so, this accounts for the slow unloading of ships, and the slowness in sorting goods, and in delivery. The matter is a constant source of complaint in the home trade, where it is found that goods take much longer to get away from the docks than from the public wharves. That I can substantiate myself, and the chief carriers can do the same. This is believed to be largely due to the extreme centralisation and red tape system of the dock company, but, at any rate, the fault exists, and ought to be seen to.

1245. You say that from your own knowledge?—I can say that from my own knowledge; it is very present to my mind. (8) "Railways and Canals." All the docks ought to be fully connected with the main railways leaving London, so that, as in other places, goods could be unloaded and immediately sent away in trucks direct to the many inland centres of trade. That applies very much to the case of sugar, where they have better appliances at the outports, and sugar, instead of going through London, as it might reasonably be expected to do, in some cases goes through places like Harwich, and places further north. There is practically little or no co-operation between the dock companies and the railways, but the latter have for many years past pursued a policy of developing ports of their own to the injury of the Metropolis.

1246. Can you mention cases?—We go on to mention them. A striking example of this fact will be found in the purchase of the Southampton Docks by the London and South-Western Railway. Southampton is only one port which may be cited, because a similar policy is pursued all round the coast from Littlehampton to Harwich, Grimsby, and Hull; the whole of the railway companies concerned with London, in fact, adopt similar policies, and it is a question whether an error has not been made by Parliament in granting to the railway companies the control of seaports. I should mention with reference to the railway companies that until the late inquiry into railway rates the terminal rates in London were very much higher than at other places, and by the exertions of the Chamber of Commerce on the railway rates question that anomaly was removed. It was of very vital importance to the Port of London in connection with this question, but in the past a great deal of the trade no doubt was sent to other ports in consequence of that. The result of that policy may be seen in the sugar trade, which formerly centred in London, and where wholesale traders are now forced to hold stocks all over the kingdom. That I can speak to from my own knowledge. We have from 40 to 50 stocks of sugar stored all over the kingdom now, which in former days would have been stored in London. I am quite aware that the development of trade would have caused a great deal of scattering of sugar in consequence of the Continent being opposite different ports, and there are other reasons, but at the same time we feel positively certain in our own business that that scattering of the sugar trade, which is very injurious to us, which involves more capital and more risks, is largely due to the heavy rates in London, and to the system of the port generally. In business these opinions are formed over a course of years, and very often the individual facts which lead you to form the opinion are forgotten.

1247. That is your own personal opinion now?—That is my own personal opinion. The mistake has already been recognised in the case of canals, which the public, to a certain degree, allow to be spoiled or to be undeveloped, in the supposed interests of the railway companies. Hamburg and other Continental ports are in communication with the whole of the canals of the country, which give them cheap water transport. In France the Government during the past generation has spent over forty million sterling on the canals of the Republic, which are entirely free from tolls, and are brought up to the age in every respect.

1248. Have you the reference for that?—I have not, but it is a matter of common notoriety and knowledge.

See 8703.

1249. I distrust matter of common notoriety and knowledge very much when it comes to evidence before this Commission. I should like to have the reference?—I will endeavour to find it.

1250. (Chairman.) An international report published some years ago would give you a full account of the canal

system in France?—In Germany, it is not only the sugar bounties that promote cheap exports of sugar, but the canalised Elbe which brings supplies of sugar in very large barges at extremely low rates down to Hamburg. In our own case from Aussig, which is on the Austrian frontier, we get sugar conveyed at 10s. a ton; it flows down with the stream. Our own canals are not only unconnected with the docks, but the whole system is absolutely behind the age.

1251. They are connected, but not used?—They are used; I mean they are not adequately connected.

1252. They are physically connected?—They are physically connected, but the connection is at a considerable distance, and there is no co-operation between them. The docks of London should (this is what we mean by co-operation), if practicable, be in complete and full communication both with the canals and with the railway system of the country. Now we come to objection 9, "The Financial Position of the Dock Companies." The financial embarrassments of the docks are mainly a matter for the shareholders to consider, but they have an important bearing on the port, by preventing improvements. Poverty, of course, renders reform very difficult indeed, but at the same time it is no excuse whatever for the proposition made by the allied companies, as a result of which this Commission is sitting, which, while increasing their own revenues, would depreciate the property of others, in order to make up for their own losses. When the docks were constructed it was on the express condition that the freedom of the river was preserved, and the provision was probably based on the old common law, that where a boat will float there navigation is free. It is true that the first docks on their construction were granted a partial monopoly for 21 years, but on condition that they compensated the waterside property owners of London for the temporary loss of their privileges. I believe it was £1,000,000 that they were granted. At the expiration of the monopoly Parliament, finding that the dock company had sufficiently profited, refused to renew it, and again threw the river absolutely open, as it had, indeed, always continued to be for certain classes of goods. Parliament has twice refused to give the dock companies power to charge lighters and barges entering the docks. I should say that since the last refusal, which was in 1863, I think, more than half the water area of the docks in the Port of London has been constructed, so that the dock companies did it at that time with their eyes open. Circumstances no doubt have changed since then. It is hoped that the Royal Commission will effectually put an end to the revival of a scheme which would be injurious to the trade of London, as well as detrimental to the enormous waterside interests of public and private wharf owners along the banks of the Thames. I can put in a personal point there and confirm it. We have private wharves on the banks of the Thames in my own firm, and taking out the particulars we find that we pay one-third more rent per foot occupied than we do inland for the facilities of barging—importing goods by barges up the river without paying the dock charges. If the barges were charged the tolls proposed by the dock companies in the late Bill before Parliament—which is apparently about to be revived, as I see by the papers, with some modifications—if they made those charges on barges, the extra value of those warehouses would be lost to us. That is our own case, but it is still more the case with the public wharfingers of the Port of London, who are almost entirely dependent on the transfer of goods by barges. Speaking generally, the scheme recently proposed to Parliament by the allied dock companies would, in the opinion of the London Chamber of Commerce, inflict the gravest loss on the trade of this city as a whole. I now come to the subject of a "Dock Trust." The London Chamber of Commerce believe that the only effectual remedy for the existing disastrous state of things is to be found in the formation of a Dock and Harbour Trust resembling that which has been so successful in Liverpool. It is thought that it would be practicable to deal with the matter by separating the water basins of the docks from their warehouses, and constituting them into the Port of London in conjunction with the river itself. We discussed the matter very fully, and we came to the conclusion that it would be absolutely impracticable to incorporate in one scheme the docks, the dock warehouses, the public warehouses, some 50 or 60 in number, and 300 odd private warehouses along the Thames, which do not take goods for rent.

1253. They are not so in Liverpool?—No, the inland ones are not. The Dock Trust owns the warehouses belonging to the docks, but not the inland docks.

1254. There is a separate Warehouse Company?—Yes.

1255. Is your suggestion that all the docks would go into the scheme?—Yes; not the allied docks only, but that there should be a Water Trust for the Port of London.

1256. That is not so in Liverpool. The Bridgewater Docks never belonged to the Mersey Dock and Harbour Board. They have only recently purchased some portion of it during the present Session. Therefore, if you take the analogy of Liverpool, it is not necessary that all the docks should be in the hands of one trust. I only interpose that as a matter of fact within my own knowledge?—I understand there were difficulties with the Bridgewater Canal, but when I went down to Liverpool, where I spent a long time looking into the whole of this question, I understood that arrangements had been made by which the docks would buy out the Bridgewater influence. It is thought that it would be practicable to deal with the matter by separating the water basins of the docks from their warehouses.

1257. (Sir Robert Giffen.) Have the County Council gone into the question of how it could be done?—I am not in a position to say.

1258. Or the Chamber of Commerce?—We should be quite prepared to go into it if the principle were accepted, but at the present moment we have not done so. It would require an Act of Parliament obviously, and a proper scheme of compensation by arbitration. Beyond that I do not know what more would be necessary.

1259. Take the case of warehouses overhanging the dock waters?—We are quite prepared to draft a scheme if we are asked to do so, but at present we have not gone as far as that.

1260. But if it cannot be done at all—if there are physical difficulties in the way of separating the warehouse business from the other?—I do not think there is any physical difficulty; it would require a slip on the quays. The warehouses are quite separate, they are some way back.

1261. I do not wish to argue the matter out now, but it is really very important to know how far the question has been considered, and how far you are prepared to say that it is practicable in the case of some of the docks to separate the warehouse business from the other business?—We have not gone into it in detail; we have only gone into the general idea. A Dock Trust could then be formed for the water area of the port, on which shipowners, importers, exporters, the dock warehousing companies, and the various wharfingers of London, as well as the Government and local bodies, should be represented. If the whole tidal basin of the Thames were under one authority, allied with, or including, a trust for the navigable waters of the port, the necessary revenues would be found, firstly, in the present sources, as paid to the Conservators or others; secondly, if a tonnage rate on ships were found to be insufficient to bring the port up to date, the merchants of London would not object (under a trust) to a reasonable rate being charged on all goods, whether taken to dock warehouses or the public or private wharves. Such a charge would be differentiated from the late proposal of the dock companies by the fact that it would affect all interests alike, and would give no one any preferential treatment. That is a very important departure. It is a different proposal to what the docks have made with reference to barges and so on, but it would give the amount of revenue, probably, that might be required; that is, that all goods landed in the Port of London should pay a certain charge, whether they are landed at the docks or at wharves or at private warehouses. The London Chamber of Commerce is, however, inclined to think that the port has fallen so much behind the age, that a temporary rate on all property in the Metropolis may be necessary to bring the Thames up to date; and that the vast importance of the question would justify such a tax if it be found needful.

1262. (Chairman.) Those are the general conclusions to which the Chamber of Commerce have arrived?—Yes, my Lord, after a great number of meetings and very exhaustive enquiry from our own point of view.

1263. And they would be prepared to support the allegations made in this statement by evidence?—By witnesses, yes. Of course, when they are matters of opinion like this last statement—that a rate in London

might be allowable—we cannot support that by evidence. That is a matter of opinion simply. There are some other matters of opinion in the course of a statement of that sort, but as to all matters of fact, we shall be prepared to substantiate them by evidence, or to withdraw them if not substantiated.

1264. Any suggestion as to the formation of a trust by so important a body as the Chamber of Commerce of London should, I think, be supported by some sort of scheme before it is considered by us again?—If you would express that as the opinion of the Commission, we would set to work to try to prepare one.

1265. Of course, there are other proposals for raising funds before us, and the Chamber of Commerce, if they oppose those schemes, must be ready with an alternative. They should be prepared, I mean, to substantiate this statement with a distinct alternative showing how it can be done?—We will undertake to do our best to draw up a scheme. Of course, it is a very complicated matter, because there are all the conflicting authorities at present.

1266. It is one of the objects, I presume, of this Royal Commission to ascertain the views of the parties in London, and therefore we trust that the London Chamber of Commerce—which is one of the most important parties, perhaps the most important party—will assist us?—Our next witness, Mr. Coke, will have a statement to present to you.

1267. We cannot go into the statement at the present time?—Our next witness, Mr. Coke, of Sassoons, was largely instrumental—

(Mr. Ellis.) We will hear Mr. Coke when he comes, but I must say a few words on the statement which has been laid before us, because it is a very serious matter. As I understand, the statement made by the witness has been placed on this footing: that it is a sort of counsel's speech, to be substantiated by evidence, and I think that is the right footing upon which to receive it.

(Chairman.) That is what I have endeavoured to lay down.

(Mr. Ellis.) Exactly, and until the very controversial opinions and rather serious charges and allegations in the statement are substantiated by evidence in the true sense of the word, speaking as a Royal Commissioner, they have no effect whatever on my mind. I desire to acknowledge as an individual Commissioner the great care and trouble which the London Chamber of Commerce—so important a body—has taken to lay this matter before us, but under these circumstances I do not propose to ask this witness any question upon the statement, reserving my questions for the time when the witnesses are called to substantiate the statement.

(Chairman.) I quite agree with what Mr. Ellis has stated, and I do not propose to ask you any questions beyond those I have already put to you.

(Witness.) The Secretary of the Chamber reminds me that we are really following the request of the Commission in putting the general witnesses first, leaving the special witnesses to come afterwards; because this might just as well have summed up the evidence, only we thought it desirable to draw up a general statement of our opinion, and first of all lay that before the Commission.

(Chairman.) I do not in the least find fault with the Chamber of Commerce—I think in many ways it is very desirable that we should have their proposals as a whole before us before we go into details.

1268. (Sir Robert Giffen.) In dealing with the lightering system you refer to steam barges. I should like to ask whether there are any steam barges employed now?—I believe not—a great many barges are towed—strings of barges are towed by tugs.

1269. But there are no steam barges going from dock to dock?—I cannot say of my own knowledge, I think not. But there is one great defect with regard to barges when they are towed.

1270. We had better not go into that now?—This is a matter of fact relating to our own trade. Two people have to go in each barge, which adds very greatly to the expense of barging when barges are towed.

1271. I only asked because in the Committee of 1879 reference was made to steam barges as being actually used, and one of the witnesses spoke of the likelihood of their increasing?—In our own trade they were not used.

Mr. J. I.  
Rogers.

15 Nov. 1900.

Mr. CHARLES CHARLETON called and examined.

Mr. C.  
Charleton.

15 Nov. 1900.

1272. (Chairman.) You are a member of the Council of the London Chamber of Commerce?—I am.

1273. How long have you been so?—Some five or six years I should think, perhaps more.

1274. And you are managing director of the firm of Johnson and Co., Limited, cement manufacturers?—Yes.

1275. You are also managing director of the Associated Portland Cement Manufacturers, Limited?—Yes, that is the company which has recently been formed in which my company will shortly be absorbed.

1276. You are chairman of the Cement Trade Section of the London Chamber of Commerce?—That is so.

1277. And you are also Chairman of their Railway and Dock Rates and Charges Committee and their Dock Trust Sub-Committee?—Yes.

1278. The general statement of the London Chamber of Commerce contains a reference to an attempt made by the London and India Docks Joint Committee to impose charges on sailing barges. Have you any detailed evidence as to that?—The evidence is principally contained in the judgment obtained in Court, but if any further evidence as to details is required we can furnish it. In the year 1899 the London and India Docks Joint Committee imposed charges upon sailing barges, carrying (amongst other goods) cement to vessels lying in the docks, without further notice than an alteration of their table of rates. The charges were paid under protest, and an action was entered in the Commercial Court in July, 1899, under the auspices of the cement trade section of the London Chamber of Commerce, by a firm of cement manufacturers for the recovery of the money paid to the London and India Docks Joint Committee. I hand in a copy of the judgment of this case. As will be seen from the report judgment was given that such charges were wrongfully demanded and must be repaid.

See 1197 8.

(The Witness handed in a report of the Judgment in the case of the *Burham Brick, Lime, and Cement Company, Limited, v. London and India Docks Joint Committee*. See Appendix, 4th day, No. 9.)

Mr. HENRY COKE called and examined.

Mr. H. Coke

1285. (Chairman.) You were originally in the service of the Government of Bombay?—Yes.

1286. As civil engineer in the Public Works Department?—Yes.

1287. In what years?—From the year 1855 to the year 1864.

1288. After that date you joined a commercial firm, the firm of Sassoon and Company?—Yes.

1289. The well-known East India and China merchants and bankers?—Yes.

1290. When did you go to Liverpool as agent for that firm?—In 1867.

1291. After being there 25 years you became the general manager of the same firm in London?—Yes.

1292. You have been director of the Mersey Dock and Harbour Board?—A member of the Board.

1293. And President of the Liverpool Chamber of Commerce?—For four years.

1294. (Mr. Ellis.) You are not now on the Mersey Docks and Harbour Board?—No, I retired when I came to London.

1295. (Chairman.) You have had considerable experience not only in Liverpool, but in Bombay in connection with the management of the Sassoon Dock?—Yes.

1296. And also in reference to the formation of a port trust?—Yes.

1297. Will you state what was the condition of the Port of Bombay when you went there?—I submitted to the Secretary of State for India in Council a scheme for the formation of a port trust for Bombay, the chief features of which were based upon the Liverpool system. This was adopted, and the Government of Bombay were authorised, to carry out this scheme which, with slight modifications, they did. It has worked admirably, and the Port of Bombay is now one of the cheapest and best organised ports in the world. The whole of the expenses are borne by the trade, and the facilities provided have continued to keep pace with the requirements of com-

1279. This Railway and Dock Rates and Charges Committee of which you are chairman was appointed in November, 1899?—Yes.

1280. Have you formulated your scheme for a dock trust?—I think Mr. Rogers to some extent answered that question. The Railway and Docks Rates and Charges Committee appointed a Dock Rates Sub-Committee, and in doing so they empowered them to formulate, if they were able to do so, a scheme for a dock trust. When that matter came before the Council of the Chamber it was altered—I cannot give you the exact words—but it was so altered that the sub-committee were empowered to confer with other bodies with that object in view. Of course, if it is the wish of the Commission, as Mr. Rogers says, that the Chamber of Commerce should endeavour to formulate some scheme they will be only too pleased to endeavour to do so.

(Mr. Ellis.) We do not ask them to do it.

1281. (Chairman.) What I stated was that they have submitted to us a certain statement, and that will be of no value to us unless the scheme is formulated. I leave it in that way. I do not ask the Chamber to do it, but I say that that is their only way of presenting the matter before us in a tangible and substantial form?—I quite understand. I merely wish to explain that the Council altered these words "formulate a scheme" to enable us to confer with other bodies to that end.

1282. You are not prepared to give evidence on any other special points?—No. Witnesses will be prepared—some thirty or forty—to come before you to substantiate the various statements which we have made.

1283. Your committee has been, in fact, empowered to prepare a list of witnesses to be submitted to us?—That is so, of the various trades and interests.

1284. I hope you will have due consideration for the Commission not to accumulate evidence beyond what is absolutely necessary?—We shall be in the hands of the Commission entirely as to that.

merce. The capital of the Bombay Port Trust was originally four millions sterling; it is now nearly six millions. The 4 per cent. interest on the Debentures was guaranteed by the Government. There has, however, never been any occasion to fall back on that guarantee. I should say that there has never been any occasion to fall back on the guarantee since the formation of the present port trust, but the Government had a small trust of their own previously, the nucleus of the present port trust, which they tried to manage against the other companies, and they could not do it, and there was default in payment of interest for two or three years, which the Government had to make up.

1298. Default in the interest of another company?—There was default in the revenue of the property which the small trust had in charge for the Government, and the Government were obliged to pay the interest upon the sum that was concerned, which amounted to £2,000,000 sterling, but after the formation of the larger port trust and the union of all the interests there was never any default, and always a very satisfactory income.

1299. That trust was afterwards included in the Bombay Port Trust?—Yes, it was taken over.

1300. How was the money found originally; in the open market by debentures or how?—In the first place the Government had invested £2,000,000 sterling of Government money in the purchase of a small portion of the foreshore property called the Elphinstone property. It would be a long story to go back and tell the whole history of it.

1301. (Mr. Ellis.) When you speak of "the Government," you always mean the Government of India?—Yes.

1302. The Bombay Presidency?—We had to deal with the Government of Bombay.

1303. (Rear-Admiral Hext.) But the Government of Bombay did not guarantee the money. The Government of India guaranteed the money?—That may be so. Whatever the Government of Bombay did, it was with the sanction of the Government of India.

1304. (Chairman.) It was partly found by Government money and partly by private individuals?—The £2,000,000 sterling which I stated that the Government had embarked, themselves, in that business, was turned over into this new trust, and four or five large properties which had been competing with Government property were taken over at a price, which was agreed upon, 4 per cent. Debentures being issued for the whole.

1305. Instead of being paid in cash?—Instead of being paid in cash. I put this in because it is such an excellent example of what was the result of the formation of a port trust. At the time when these new debentures were issued in payment for the large properties taken over, these debenture bonds were standing at about 86—86 to 90—I cannot remember exactly, and as soon as the idea of the formation of a trust took hold of the minds of the public these debentures went to 94. The properties taken over were paid for by debentures when they were 94, but a few years after—say three years after—these debentures that were at 94 went to over par, so that the people who were paid in debentures and stuck to them got quite as good as, or more than, cash for their property. I do not know that that bears more upon the subject we have before us than just as an example.

1306. You have had experience both in London and in Liverpool?—Yes.

1307. I want to know how you arrived at the knowledge that London is the dearest port in the United Kingdom?—At the time I was engaged in the formation of the Bombay Port Trust and making recommendations to the Secretary of State, I drew up a comparative statement of the charges in eight or nine different ports of the United Kingdom.

1308. What year was that in?—In the year 1878. I drew up a statement for the purpose of indicating to the Secretary of State for India that the charges on trade in the principal ports of the United Kingdom were as stated there, and that if similar charges, or an average, or even somewhat less than these charges, were imposed upon the trade of Bombay, looking at the volume of that trade, there would be an ample revenue with which to pay the interest on the £4,000,000 sterling that they started with. For that purpose I started this idea of a comparison of charges for the different ports. Twenty years ago I found what a difficult matter it was, but I got the general knowledge that such was the case—that London was the dearest, that Liverpool was the next, and so on, and I made out similar statements at that time. When this question of the reorganisation of the Port of London arose, and I myself in my business had come into contact with these difficulties in selling goods from foreign places to London on account of the charges of London, and I had more time to spare, having retired from general business, I undertook for the Chamber of Commerce, with certain assistance, to prepare a more elaborate comparison, and as I say in this evidence, I have done it for the purpose of replying to those people who deny the fact. All the figures upon which these comparative statements are based are taken from the official published charges of the different ports. I declined to go into the comparison of what could be done with private companies or private wharfers, and so on. I took what were the official charges made by the authorities of the different ports. As your Lordship said at the beginning, it will be necessary to verify all this by cross-examination, but I may say that the charges at the different ports vary very considerably in units of measurements. In wheat you will have the measurement sometimes by the cental, sometimes by the quarter, sometimes by the last, sometimes by the measure, and so on. All this had to be taken and brought down to a common denominator, and compared at so much a ton. That is what we have done, to show what is the difference in the charges of the ports. I do not know whether that may be taken as sufficient evidence of the mere fact, but if you desire me to bring up all the calculations on which the figures have been based, I am prepared to do so.

1309. I can understand that there would be great difficulty in getting at a uniform basis upon which to found the figures?—There always has been. Such as it is, there it is, and as I have said in the preface to

the statement, I am not prepared to vouch for every fraction in it, but for the general purposes of this examination it is the clearest and the truest statement of comparison that has ever been made out. Further than that, let me add that, in support of my general statement that London is a very expensive port, I put in my own personal evidence as a merchant of over 30 years standing, selling produce to Liverpool, Hull, and London, and everywhere else, and making out hundreds and thousands of account sales for constituents abroad, that the general complaint abroad is that London is so expensive; we must cut down the charges, or they cannot send the goods there.

1310. Do you know as a fact that ships have gone to other ports rather than London in consequence of these charges?—I do not know the fact of any particular steamers—to be so precise as the Commission wants to be—having done so, but I know perfectly well that when our constituents have had goods in the market for sale, they have preferred to take a certain price to Hull to taking the same price to London, and they always require 3d. a cwt. more on 9s. to send their goods to London than they would to send their goods to Hull.

1311. Is there a difficulty in comparing London with other ports in this fact, that in London nearly all the goods are transferred by water carriage, and in other ports (in England—it may not be so abroad) goods are transferred mainly by land carriage—by railway, or trucks, or by road?—I am glad you have asked me that question, because I can give you an answer directly. There is no difference whatever. In Liverpool, with a very low quay rate, a cart with two horses, that will carry 5 tons, comes alongside and takes the goods away, and the dock authority has done with them. That rate is very low. In London the barge comes alongside, and takes the goods away from the ship's side or from the quay, and takes the goods to the warehouse, and there is no difference whatever.

1312. But there is no charge on the lighters at present?—There is no charge on the lighters, or on the carts.

1313. And there is no charge on the carter—quite true—so far as the cart is concerned, but is there a difference in the railway?—Of course, if you want to send the goods away from the port where they are landed by rail to a different place, that is another matter, and I may say there is a very great difficulty in arranging a port in such a way that you can deliver by cart and by rail at the same time.

1314. It has been done with a certain class of goods—grain, for instance?—Of course, if you get a ship load of goods, you can get a truck alongside, and the carts will not interfere. The capital of the Bombay Port Trust was originally £4,000,000 sterling; it is now £6,000,000, so that it has advanced nearly £2,000,000 in providing accommodation to meet the requirements of trade. They have built two very handsome, splendid docks there since the docks were taken over. I have drawn up for the London Chamber of Commerce a return (arranged on a comparative basis) of the charges of the Port of London and nine other ports in the United Kingdom, on 22 articles of Trade. This return was handed in by Mr. Rogers, and I now submit it as evidence. My object in preparing these tables is to remove all doubt on the question of the London charges on goods, for I know that it is affirmed by the parties interested in maintaining the present state of things that London is not an exceptionally expensive port. From my experience as a merchant in London and Liverpool I know that London is the dearest port in the United Kingdom, and with a few exceptions that is now proved by this statement, which is a close comparison of the printed official charges of the ten ports treated of in the tables. If you ask me what those exceptions are, I will say that, for tobacco and bonded goods that remain in the Liverpool Dock Board bonded warehouses for a year, the charge is greater than the corresponding charge in the bonded warehouses in London, a little dearer—a difference, say, of 5s. or 6s. on £2. That is as far as the tables are concerned, and I am prepared to answer any questions that the Commission would like to put to me on those tables. I have written a preface at the beginning of the return.

1315. The preface, of course, can hardly be put in as evidence. It is only explanatory of your evidence. It may be taken as information, and subject of course to further consideration by the Commission, if necessary?—Quite so.

*Mr. H. Coke.*

15 Nov. 1900.

1316. I presume that these tables will now be public property as they are put in, and of course they will be liable to be cross-examined upon by any parties who wish to challenge the decision that the London Chamber of Commerce have come to. You are fully aware of that?—Yes. We have not allowed those tables to go out of the Chamber of Commerce until they were presented to your Commission.

1317. I understand that you have evidence to give with regard to the lightermen, but that I think had better be given whenever the question is raised by the Joint Companies, who are going to bring the matter before us at the proper time. I do not think it would be desirable to go over the same evidence now that we shall have to take later on. For that reason I will not ask you any question with regard to that point?—At the end of the return of charges I have added two tables (A and B), showing the comparative tonnage due on ships, levied by the dock authorities at the different ports and the extent of the capital involved in providing the present accommodation such as it is, the latter table—that is the financial one—more as an indication of the magnitude of the question referred to this Commission than as a suggestion of the methods to be adopted to meet the existing difficulties.

1318. (*Mr. Ellis.*) We cannot receive the statement, for instance, of the capital of the London and St. Katharine Dock, and the market value from anybody but the dock company?—I may say, that this is taken from the last returns.

1319. (*Chairman.*) We cannot take that as evidence?—This is taken from the last published statement. I do not put it in as evidence, but merely as a suggestion. This is the opinion of the London Chamber of Commerce. The London Chamber of Commerce, constituted as it is of members having different interests cannot be expected to be unanimous as to the remedies to be applied for the removal of the present evils, but there is a consensus of opinion that the present state of things should not be allowed to continue. That I can put in as evidence from the numerous Committee meetings and Council meetings that I have attended on that subject.

1320. As you have a scheme, I think we had better defer the next part of your evidence. You will have an opportunity of being heard, and you will have an opportunity of cross-examining on the statements made by the dock companies with regard to the lighters if necessary. The Commission think it is desirable not to go into that at the present time. We will receive what you say with regard to what your belief is as to the cause of the collapse. What is your opinion?—Yes. It is my belief that the cause of the collapse is to be found:—(1) In the absence of any power to make a charge on goods for the use of the docks, and (2) the right of the consignee to demand that his goods should be sorted and delivered by the ship into his special barge without any payment whatever, in fact that the steamer should be treated as if she were a 500 ton wooden vessel discharging into the stream. I have said how that system arose.

1321. That is a matter which we do not want to discuss now?—Whether it would be wise to give such extended powers of levying dues to companies, which might be exercised for the benefit of shareholders, is another question. I think that such powers should be strictly guarded.

1322. That is your opinion?—Yes, that is my opinion. This leads to the consideration of the possibility of establishing a port trust for the whole of the Thames. I am inclined to believe that a practical scheme might be formulated by the co-operation of various influential bodies; but it would not be feasible for any single association, much less any single individual to suggest the outlines of such a scheme, before knowing that the general principle would be supported by this Commission, and by some of the influential corporations whose support would be required to carry it to completion. Looking at the capital involved in the Liverpool Trust (say 20 millions)—at present their debentures standing out are 20 millions, but they have spent a good deal more than 20 millions—and the ease with which the revenue is raised, not only to pay the interest on this capital, but to reduce the port charges from time to time. I think that London, with its much larger tonnage of ships and volume of trade, could with equal ease maintain a trust which would supply all the requirements of the port, within a reasonable amount of capital.

1323. (*Mr. Ellis.*) Referring to these tables, which no doubt have cost somebody a great deal of care and trouble, if you turn to Table 1 the question I want to

ask you is to what date the rates or charges apply—London, Liverpool, Hull, and so on?—To the last printed official statement. They are generally about a year old.

1324. Will they all be about the same date?—About.

1325. Then I may take it for granted that they are all within the last year or two?—Yes.

1326. They are none of them antiquated charges?—Not at all. In the case of the Mersey Dock and Harbour Board I brought them down to the latest corrected charges. The quantities imported in 1898 were taken from the Customs Report, 1898, because that for 1899 had not been issued when this was drawn up.

1327. Then, taking them for whatever they are worth, they are all of recent date?—Yes, they are all recent.

1328. (*Chairman.*) As far as your own personal opinion is concerned, are you in favour of the deepening of the river to, say, the Victoria and Albert Dock, to at least 30ft.?—I think that, unless that is done, other ports in the United Kingdom must certainly get the trade that is brought by the big ships that are being built at the present time. In the last 10 years the Port of Liverpool has obtained sanction to spend about 7½ millions in meeting the requirements.

1329. We can get that from Liverpool?—Yes. Unless the depth of water is such as will allow these big ships to come up to London they cannot come here.

1330. Have you ever heard that there was any objection to any increased dues, such as those that are levied by the Thames Conservancy for the purpose of deepening the river, which they have not yet done, to the extent that was recommended by the Committee of 1894?—I know this generally: that with regard to any trade that has been accustomed to a charge, however small it may be—absurdly small it may be, compared with other places—if you propose to increase it they will all cry out and object to it. One witness told you that the money that was required for the development of the Tyne was produced by a rate of 1½d. per ton upon coasting vessels, and 3d. per ton upon over-sea vessels. There is a corresponding charge in the Mersey for vessels which do not go into the docks, merely for keeping the navigation open. See 140.

1331. But you know in the Mersey there are two bodies: there is the Liverpool Dock Trust and also the Upper Mersey Conservancy Commissioners. Therefore, in an area which is not greater than that between Tilbury and London Bridge you have two bodies who have control of the waterway. Is it not so from your own knowledge?—That is my own knowledge. I know it perfectly.

1332. And there are docks owned by the London and North Western Railway Company, by the Manchester Ship Canal Company, and by the Shropshire Union?—At Ellesmere Port.

1333. All within an area not greater than what is comprised within the London Docks; and yet it works satisfactorily?—Yes, it works satisfactorily. All the vessels passing up the Mersey to an imaginary line which separates the Upper Mersey district from the Dock Board area pay those harbour dues, and they go towards buoying and dredging.

1334. Improving the whole river perfectly independently of the docks?—Yes. Then with regard to the vessels that go into the docks and pay the large dock dues of 1s. 4d. per ton and so on, from over-sea, a certain proportion is deducted by Parliament from the general revenues of the Trust, and put over to the credit of the account. I myself took a very leading part in the introduction of the system for dredging the bar. I was on the Finance Committee, and pointed out the financial means of getting the thing done. At that time there was an amount of £60,000 to the credit of the Conservancy account out of all these different sources of revenue. The Dock Board had no difficulty whatever in setting to work with an experimental scheme for the dredging with £60,000 to fall back upon. In the case of any port authority that has command of revenue to do what is necessary there is no fear about starting to do it when their own knowledge is brought to bear upon it and their professional advisers also recommend the scheme to be carried out.

1335. Then I gather that, whatever improvements may be made in the docks, you think that the first improvement, and that of the greatest importance, is the deepening of the Thames to the depth recommended by the Committee of 1894—30ft.?—That is the very first necessity.

1336. (*Sir Robert Giffen.*) I do not wish to go into the question of the details of your return, which are matters of information which you have been good enough to supply us with, but I should like you to make a little more clear what the bearing of the comparison is, assuming all the details to be true. Are you quite satisfied, as the mode of comparison, that you should lump together all these different ways of doing things which may be important at one port and not at another. For instance, supposing the delivery overside in London, where there is no charge, should apply to three-fourths of the goods, have you allowed for that in making your comparison when you say that London is the most expensive port?—As far as the charge is concerned. But let me go a little further. I see what your point is. Allowing the goods to be taken away free overside, and to pay no inland dues, or no dock wharfage charge, as they pay in Liverpool, when they are put into a barge and taken away, the charge at the warehouses is, by agreement with the dock companies, from 4 to 10 per cent. less than the dock companies charge.

1337. That relates to a warehouse charge?—Yes, that relates to a warehouse charge.

1338. The goods may be taken away and pay nothing?—I have said that for that special branch of the trade of London, as regards manufacturers on the banks of the river, who buy to arrive, and who take the goods away from the ships to their own warehouses, London is practically a free port.

1339. Does not that apply to three-fourths of the trade. That is the point I am putting?—I cannot tell you what proportion goes to private warehouses.

1340. But is not that important; that three-fourths of the goods are dealt with under A, and not under B, C, and D?—As far as the docks are concerned it may be so, but not as far as the merchant is concerned.

1341. These are all the official charges. You are dealing here with the official charges?—Yes, I am dealing here with the official charges, and you ask me with reference to the volume of the trade that comes under these charges.

1342. Undoubtedly?—What I say is of the goods that go away free overside, which in my opinion ought to contribute to the support of the port, but that is beside the question.

1343. You think they ought not to be free?—I think certainly not. They have services rendered; they have water supplied for them; they get all the conveniences of a dock; and if the dock companies could have foreseen the present state of things when they accepted the conditions imposed upon them by Parliament over a hundred years ago they would not have laid out their money in building docks for London. When I tell you of goods that go away without contributing anything towards the support of the dock companies, a portion of them go to private warehouses and a portion of them go to what may be technically called "public" warehouses, where they are warehoused for the merchant. When the merchant gets his goods out of those public warehouses, where he pays rents and charges, he only pays about 5 per cent. less than he would if he left the goods in the docks.

1344. As compared with another port, Liverpool, which delivers very much into carts from the quay, and where a charge is made by the dock company for the delivery into the cart, if those goods have to go to a warehouse afterwards, there is cartage to pay, and warehouse charges to pay, whereas in London the goods are delivered to the lighter for nothing. So that there is a difference to the advantage of London, as far as I can judge from your figures?—Let me say that the whole of the inward dues, and the charges in Liverpool which are called "master portage," which are the two initial charges upon goods coming into port, are all swamped by the warehouse charges here. They disappear, and the owners of the warehouses and the barges get the advantage.

1345. But still the warehouse charge as far as the Dock Companies are concerned is a charge that simply applies to one-fourth of the goods?—Yes.

1346. And you are dealing here with official charges?—The warehouse charges of the Dock Company are a consolidated rate. Many years ago, when I came back from organising the working of a dock in Bombay, I went over the docks here, and asked how they arrived at that consolidated rate: did they begin with the rate for inward dues, wharfage, and removing goods from the warehouse, and then manipulating them in the warehouse?

Did they break them up? They said no, they only made one consolidated charge, out of which they supposed they would get sufficient to pay their expenses and their profit. But we are perfectly justified in supposing that in allowing that consolidated rate the Dock Companies must have considered that the first expense that they had was to pay the interest on the capital involved in giving that accommodation to the goods. *Mr. H. Coke*  
15 Nov. 1900.

1347. I am afraid you are getting further away from my point, which is a mere question of fact: whether as regards this portion of the trade—that is to say three-fourths of it—London is not cheaper than almost any other port you have mentioned; that is, as far as the official charge is concerned?—My answer is that whatever portion of that three-fourths goes to a private warehouse—

1348. That is not an official charge?—It is a question of what is the result to the merchant in the end.

1349. That brings me to the other question, whether the reputation of London as being the dearest port—admitting that that is the reputation of London—does not arise in part, not from the official charges, but from the other expenses connected with the handling of goods, which are not official, and for which the Dock Companies and the other public bodies having to do with the river are not in any way responsible?—I think considering that these charges in the public warehouses are based upon the consolidated charge of the Dock Companies, there is some connection between the dock charge which necessarily involves wharfage, and the charges made by the warehouses.

1350. But still they are not official charges, and they belong to the free movement of the market, with which we have very little concern in this place. We are dealing with official charges?—There is a working arrangement between the wharfingers and the docks. That is how it comes out.

1351. I cannot bring you to see that we are dealing here with official charges by the Dock Companies?—What I have dealt with are official charges by the Dock Companies, and nothing else.

1352. You say that these figures of yours prove that London is the dearest port of all those that you have mentioned; and I am pointing out to you that as far as regards three-fourths of the trade London is the cheapest port as far as these figures carry us?—I can only repeat that as far as those goods go into private warehouses it is a cheap port, but as far as they go into public warehouses, the charges for which are based upon the charges of the Dock Companies, it is a dear port for the merchant who has to bring the stuff to this country, and to sell it and deliver it. I have indicated all the free goods in the table here.

1353. No doubt, but the inference I am now suggesting from the tables is quite different from the inference you have put before us, and I wish to know quite clearly whether you have allowed for the different proportions of the trade?—I have not taken out the proportions, in the first place because I had no means of knowing for a certainty what was the proportion.

1354. Then how could you make a comparison between the ports at all unless you know the proportions. You ought to take the aggregate of each trade and then strike an average?—You certainly can make a comparison of actual charges for work done.

1355. For instance, what is the good of giving us a comparison of London and Liverpool as far as regards delivery from the import quay to the cart, when you have a dock like Tilbury Dock, where the goods would never be delivered into a cart to go to their destination?—Will you let me say that I was dealing with nine different ports that did their business in different ways, and whether they did it or did not, it stood in the first column.

1356. But still, when we come to apply our minds to the tables, we must take into account some of the considerations which I am now putting before you, and as far as I can judge the importance of the thing for London is the Class A. This is the most important class which we have to consider. I do not say that the others are to be disregarded altogether, but this is the important class. Then I ask you how you justify your inference that London is the dearest port?—I justify the inference that it is the dearest port by the charges made for the special work done. If the work is not done, and there is no charge upon it, it does not come into the comparison.

*Mr. H. Coke.* 1357. But there is as much work done in delivering the goods into the lighter by somebody as there is in delivering them over the quay?—Yes; the dock companies do not do that.

15 Nov. 1900.

1358. I am merely wishing to get to an understanding of what the figures mean?—That is not a question that would arise, and it is such a complex question that it would have been most difficult to find out what would have been the amount multiplied by the volume of the trade. That is what you mean, I suppose.

1359. We as a Commission must do something of that kind, however roughly, to get at the actual truth of the matter, because the charge is that London is the dearest port as far as the official charges are concerned?—I have put down here in the very first column all that London does free, and below that I have put down everything for which a charge is made, and added up the column including the free.

1360. But the things they charge for are not the important things compared with the things that they do not charge for. At least, I wish to know what allowances you have made for the differences of relative importance that there may be?—I have made the comparison by the way in which the goods are handled. For instance, for goods delivered over side from ship to craft I have shown on all that class of trade what is the comparison between the charge for that class of trade done at different ports.

1361. And that shows that London is the cheapest?—No.

See 8733.

1362. It is always free in London?—I beg your pardon. I have got the table for wheat. If you look at the first one you will see that for wheat there is a charge of 1s. 9d.

1363. Is that an official charge?—That is the charge that people have to pay before they can get it.

1364. Is that an official charge? Is that a charge which the dock company are entitled to make and do make?—It is not a charge made by the dock company.

1365. Then it is not an official charge?—It is a charge that the trade of London has to bear.

1366. But the question here is, what are the official charges? Will you excuse me for bringing you back to the point?—Will you excuse me for pointing out that there is a note there, and there is an explanation with reference to that first charge on wheat which does not apply to anything else. If you go to all the other articles you will find they are all put down as free, both in London and Hull, but not for the other places. All the other tables with the exception of that one refer to goods that go free.

1367. Still you will not say that this is an official charge?—The London companies have nothing to do with laying that charge. The ships get that money.

1368. Then it is not an official charge?—I will withdraw it as an official charge.

1369. (*Chairman.*) Would not the best comparison be the actual charges which, before the goods come into the hands of the merchants, each class of goods pays at the different ports? That can only be got at by a comparison of the actual accounts sent in, so much at one and so much at another port?—That is what I have done here.

1370. They may not be all official charges?—That is the only case.

1371. But is not that the right comparison—to take each different trade, and to take what is actually paid by the merchant, whether it is an official charge or not?—That is what I have done.

1372. If you call them official charges, we will take them as official charges. If you take them as genuine charges which everyone has to pay before he can get his goods into the hands of the consignee, that is another thing?—Take the case of one article—East India cotton—

1373. (*Sir Robert Giffen.*) Excuse me interrupting you so early, but cotton is not a very important article

for the trade of London, while it is an all-important article for Liverpool?—It tells you here how much it is. It is only a few thousand tons; it is nothing at all. But take anything else.

1374. Take hides. "(A) Delivered overside from ship to craft, London free, Liverpool 10s. per 100 hides. (B) Delivered from import quay to cart, London 13s. per ton, Liverpool 14s. 4d. (C) Delivered from dock warehouse, including four weeks' rent, London £1 1s. 7d., Liverpool £1 2s. 4d." Do you say London is dearer than Liverpool?—I do not know whether you have examined this. This is, no doubt, excellent cross-examination. I have said in the tables that, with a few exceptions—

1375. But you have very few articles altogether?—I have put down in my report, "With a very few exceptions," such-and-such a thing will be found, and you have pitched upon one of those exceptions.

1376. Then I should like to put this question to you: Whether you have not very few articles altogether, not sufficient to justify general inferences such as you have given unless they are illustrated by more than the few exceptions you have given in each case?—I have taken 22 articles, and that is only one. That is exactly what a cross-examining counsel would say. He would take one, and try to upset the truth of all the others by this one; whereas I have stated distinctly that "with few exceptions" that will be found to be the case.

1377. Take tobacco?—I have said that tobacco in bonded warehouses—

1378. Allow me to say that the list of 22 articles is really a short list, and one or two exceptions in such a list, when we do not know how the articles have been selected, may become very important. I am speaking here from a general statistical point of view.

1379. (*Rear-Admiral Hext.*) In describing the Port Trust of Bombay you said that the Government, previously to the formation of the Trust, had invested two millions, which did not pay?—It did not pay previous to the formation of the Trust.

1380. What was that invested in?—In the purchase of the Elphinstone property.

1381. But that had never been developed in those days, and consequently did not pay. I am asking you this question with reference to the point which you have brought forward about the two millions as a justification for forming the Trust. That two millions really I do not think can be considered, because the Government had to pay that money for the Elphinstone estate, which had not been developed. They then handed it over to the Port Trust at that figure. In any case that property would have been developed, and houses would have been built upon it, whether the Port Trust had taken it or not. Therefore, I do not think your plea as to the two millions goes very far to prove the success of the Bombay Port Trust. Do you follow what I mean?—Yes, I think so. It points exactly to the demonstration that I intended to make—that as soon as that property came into the hands of a body that was able to finance it and develop it, it began to pay. The Government were in exactly the same position. What you call the original Port Trust—I think you were on the subsequent Trust—

1382. I had fifteen years of it?—The original Trust which handed over the two millions of property was exactly in the same position with regard to their property as all the others, the Mazagon, the Colaba, and the Sassoon Company were with reference to the receipt of revenue from their places, and the Government were going into a fierce competition with the other people, and the other people's property could not pay, and the Government property did not pay.

1383. My point is that in anybody's hands that property must have paid?—Yes, if they had the money to develop it.

(Adjourned to Tuesday next, November 20th, at Twelve o'clock.)

## ROYAL COMMISSION ON THE PORT OF LONDON.

## FIFTH DAY.

*Tuesday, 20th November, 1900.*

PRESENT :

The Right Hon. The EARL EGERTON OF TATTON (*Chairman*).

The Right Hon. LORD REVELSTOKE.  
Sir ROBERT GIFFEN, K.C.B., LL.D.  
Sir JOHN WOLFE WOLFE-BARRY, K.C.B., LL.D., F.R.S.

Rear-Admiral Sir JOHN HEXT, K.C.I.F.  
JOHN EDWARD ELLIS, Esq., M.P.

CECIL OWEN, Esq., *Secretary*.

Sir FREDERICK DIXON DIXON-HARTLAND, Bart., M.P., called and examined.

1384. (*Chairman*.) You are chairman of the Conservators of the River Thames?—Yes. I was first appointed on the 27th October, 1893, as a representative of the county of Middlesex, on the Thames Conservancy Board under the London County Council (General Powers) Act, 1893. On the reconstitution of the Conservancy by the Thames Conservancy Act, 1894, I was appointed member of the Board to represent the Middlesex County Council, and at the first meeting of the reconstituted Board, on the 7th January, 1895, I was unanimously elected chairman, and since that time I have been annually re-elected to that position. I have read the printed minutes of Evidence given before the Commission by the Secretary, the Engineer, and the Solicitor of the Board. I observe that the Commissioners expressed a desire to be further informed as to what had been done by the Conservators to carry out the recommendations contained in the Report of the Thames Traffic Committee, 1879. This information has been obtained by me from the minutes and records of the Board, from which it appears that on the appointment of the Thames Traffic Committee in 1878 the Board of Trade asked the Conservators to appoint a member to serve upon it, and Admiral Sir F. W. E. Nicolson, Bart., the Deputy-Chairman of the Board, was nominated. When the Report of the Committee was issued the Conservators were requested by the Board of Trade to assist Her Majesty's Government with their advice with respect to any legislation which might be proposed in connection with the Report of the Committee. The Conservators thereupon submitted to the Board of Trade a statement of the various points upon which legislation was in their opinion desirable. The Conservators proceeded at once to revise their Navigation Bye-laws then in force in conformity with the recommendations of the Committee so far as their powers admitted. Such revision was, however, limited almost exclusively to the rules relating to ships, as the rules respecting barges and other recommendations of the Committee, which included compulsory towage, could not be effectually dealt with without further Parliamentary powers, and the Conservators so informed the Board of Trade by letter on the 10th November, 1879. The Board of Trade replied that whenever the state of public business and other circumstances permitted, they would take into careful consideration the various points above referred to, as well as any others which might require legislation, and would propose to Parliament such amendments of the law as appeared to them to be necessary. The Board of Trade added that the concurrence of the Conservators in the Suggestions of the Thames Traffic Committee added much weight to these suggestions, and when the time came for legislating on the subject Her Majesty's Government would no doubt give due consideration to this fact, whilst at the same time the Government were in no way committed to such suggestions and were perfectly free to deal with

the same in such manner as justice and the circumstances of the case might appear to them to require. The Board of Trade stated that they "observe with satisfaction that the Conservators are publishing a draft of amended Bye-laws which they doubt not will contain all the provisions which their powers enable them to make." Early in 1880, these Bye-laws were submitted to the Board of Trade for the approval of Her Majesty in Council, and were approved on the 18th March, 1880 coming into force on the 1st June, 1880. In October, 1880, the Conservators again sent to the Board of Trade a statement of the points on which they considered legislation desirable in the ensuing session for the purpose of carrying into effect the recommendations of the Thames Traffic Committee. To this the Board of Trade replied asking if the Conservators would pay the cost of introducing the Bill into Parliament, and this the Conservators agreed to do. The Bill was thereupon drafted, and the Board of Trade and the Conservators agreed on the desirability of introducing it as a private measure, the Conservators stipulating, however, that the Board of Trade should have sole charge of it, and that the names of the President and Parliamentary Secretary should be put upon it. The Bill was introduced, and embodied the whole of the recommendations of the Thames Traffic Committee, which had not already been dealt with by the revised bye-laws. On the 29th March, 1881, following a debate in the House of Commons, at which I was present, the President of the Board of Trade withdrew the Bill and introduced it as a Public Bill on the 4th May, 1881. It was not considered right that it should be a private Bill. This Bill was withdrawn on the 4th July, 1881, by the President of the Board of Trade. The expense incurred by the Conservators in promoting these Bills amounted to over £1,100. In November, 1881, the Board of Trade informed the Conservators that the President had given directions that notices should be given for the introduction of a Bill or Bills for carrying out the object sought to be attained by the Thames River Bill of 1881, which, owing to the pressure of other public business, had to be postponed. The question of the expenses of promoting these Bills was raised by the Conservators, and the Board of Trade took up the question with the Treasury by a letter dated 16th November, 1881. The Board of Trade therein stated they proposed that in the Session of 1882 the questions should be dealt with by two public Bills, and suggested that the Bill for the abolition of the Watermen's Company and compulsory pilotage should be considered a Government measure, and paid for by the Government, and that the Bill for regulating the navigation should be paid for by the Conservators.

Sir F. D.  
Dixon-  
Hartland,  
Bart., M.P.

20 Nov. 1900.

After much correspondence the Treasury agreed to the expense of the first-named Bill being borne by the Government. In November, 1882, the Conservators issued notices for their proposed Thames Navigation Bill, which ultimately became law (Thames Act, 1883), and which dealt with the following points raised by the Thames Traffic Committee, viz.: (1) Increase of penalties for breaches of rules as to navigation of Thames; (2) Metropolitan Police to assist in detection of breaches of Conservators' Acts and Bye-laws. A letter was received from the Board of Trade stating that the President of the Board had given directions for notices to be prepared for the introduction in the Session of 1883 of a Bill to abolish compulsory pilotage and to discontinue certain privileges of the Watermen's Company; that the Bill would be similar to the one which, owing to the pressure of other public business, could not be proceeded with. Such a Bill has not up to the present time been introduced by the Board of Trade or other Government department. Before leaving this subject I should like to call attention to the fact that the Thames Conservancy Bye-laws of 1898 cover the whole of the recommendations of the Thames Traffic Committee under the head of "Rule of the Road," and, moreover, adopt all the revised Regulations for Preventing Collisions at Sea of 1897 so far as they are applicable to river and harbour. With regard to lights on barges the recommendation of the Committee has been accepted by the Conservators, and Bye-law 31 of our Bye-laws of 1898 prescribes that all lighters below London Bridge when under way and not in tow between sunset and sunrise are required to have a white light always ready, and to exhibit the same on the approach of any vessel. With regard to the Committee's recommendation as to the navigation of barges by competent men, I should like to point out that Bye-law 27 of the Thames Bye-laws, 1898, provides that lighters above 50 tons burden shall have two, and above 150 tons burden three persons to navigate them. I should like also to point out that the penalty under the present Bye-laws of the Conservators has been increased to an amount not exceeding £10, and not infrequently the full penalty has been inflicted, especially in cases where there has been a previous breach of the particular Bye-law. It was brought up that the old penalty of £5 was not sufficient, and that if we could get a £10 penalty we should be more likely to get the law obeyed, and, in consequence, it was increased to £10. That is the end of my evidence with regard to the Thames Traffic Committee of 1879. Then with regard to the Lower Thames Navigation Commission, I have read the report of the Lower Thames Navigation Commission of the 25th March, 1896, which Commission was appointed by the Board of Trade under the provisions of Section 189 of the Thames Conservancy Act, 1894, the last paragraph of which provides: "If any dredging or other operations shall be recommended in the report of the said Commission, the Conservators shall, as soon as may be reasonably practicable after a copy of such report shall have been received by them as aforesaid, either proceed to carry out such dredging or other operations, or apply to Parliament for all such powers as shall be desirable to enable them to give effect to the recommendations of the said Commission." I should also like to point out that the sole reference to that Commission was: "Whether any and what dredging or other operations are practicable and expedient for the purpose of improving the navigation of the Thames and the estuary thereof, between Thorney Creek, in the County of Essex, and the Nore Lightship." That is in paragraphs 49 and 38. And further: "As to the probable cost of such dredging and other operations, if any, which the said Commission may deem practicable and expedient, and as to the means by which the funds necessary to meet such cost should be provided." The Commissioners in their Report did not recommend that works in the river between Thorney Creek and the Nore Lightship within the limits of their reference should be carried out by the Conservators, and I should like to refer particularly to paragraph 49 of the Report, in which the Commissioners state as follows—this is a very important paragraph: "Having come with some regret to the conclusion that works in the river between Thorney Creek and the Nore cannot at present be recommended, we have found it unnecessary to proceed with the second branch of our inquiry, namely, the source from which funds shall be provided for works of improvement within that area. We fully recognise, however, that the deepening of the Thames is a matter of great im-

portance, and that the mode in which the necessary funds should be provided demands very careful consideration. It seems to us that the financial powers of the Conservators, whenever the fitting time arrives for undertaking the works, should be dealt with as a whole, for though we think it is expedient to provide a deep water channel to Gravesend (or even possibly to the Albert Docks) it is of equal, and perhaps greater, importance that no financial burden should be so placed as to damage the commercial interests of the Port of London in the present severe competition with other ports in this and foreign countries." I should like to refer also to paragraph 38 in which the Commissioners stated for the reasons given therein that they could not "recommend the immediate expenditure of money between the Nore and Thorney Creek." That is a part their reference referred to. Having regard to the terms of the Report of the Commission the Conservators did not consider it incumbent upon them to apply to Parliament for any further powers, and I should submit to the Commissioners that looking to the inconclusive nature of the Report it could not be held to be mandatory (as it has been termed) upon the Conservators to go to Parliament. The Conservators therefore decided to adopt a scheme of improvement—they always had a particular line of policy, and that policy they have continued and are continuing to the present day—which although involving a large expenditure could by careful management be carried out with the financial resources at their disposal. This scheme provides channels:—

From the Nore to Gravesend	1000 ft. wide, 26 ft. deep.
" Gravesend to Crayfordness	" " " "
" Crayfordness to Royal Albert Dock	1000 " 24 "
" Royal Albert Dock to Millwall Dock	500 " 22 "
	300 " 18 "

It is completed at the present moment as far as Gravesend, the remainder being in progress. Then I should like to point out that the cost to the Conservators of the Act of 1894 was as near as could be £12,000, and therefore in any Act we brought up we should have had to look forward to much the same expense, and as it would involve a large quantity of taxation to be put somewhere we knew we should be thoroughly opposed by anybody we proposed to tax, and we might have the Bill thrown out, and probably the whole of the money which had much better be spent in dredging would be thrown away. The Conservators have recently, as desired by the Commissioners, for the purpose of stating the policy of the Board, considered the subject matter of the reference to the Commission, and have arrived at the following conclusions: In view of the tendency to increase the size and draught of ocean going steamers, the Conservators, though not admitting that the Report of the Lower Thames Navigation Commission contains a specific recommendation that a navigable channel of 30ft. below low water of spring tides should be provided up to Gravesend, are prepared to deepen the river where necessary to provide such a channel, if Parliament considers it desirable, and will provide the means for raising the necessary funds. With regard to that I may simply say that the Conservators do not consider that the River Thames is a river that is up to date in the same way that many of the rivers are—the Tyne, the Mersey, and various others; and we do consider that it is our duty and it is our wish and our intention to do everything we can to make the Port of London in a satisfactory state, if we can only get the money to do so. The distance in the Thames from the mouth up to London is very much larger than the distance in the case of the other rivers I have referred to. We do feel that it will be an enormous undertaking, but we consider that it is our duty to do it, and we wish to do it if we can only find the funds. At the present moment we have spent every penny we can spend in promoting the navigation and deepening the river. Our estimate for this year has just been brought up to the Conservators, and making allowance for everything which we have to do, and are able to do, it only leaves us a balance of £15 upon the year's income, therefore showing that we are actually doing all we can and all that is in our power. When promoting the Bill of 1894 the Conservators made proposals to Parliament for the reconstitution of their Board, and this subject was considered at great length by a Committee of the House of Lords as well as that of the House of Commons, who after hearing the many claims

for representation, settled upon the present constitution of the Board. In practical working this constitution has been found in all respects satisfactory, and no complaints have been made as to the administration by the Conservators of the powers conferred upon them by their Act, or as to the general management of the river as a whole. I may say that the upper river is managed by one Committee and the lower river is managed by another Committee, and the whole time that I have been Chairman there has never been a solitary thing which the Lower River Committee recommended which has been in any way upset or interfered with by the Upper River Committee, and *vice versa*. Therefore the constitution as it at present exists is eminently satisfactory for the working of the river. With regard to the extension of the 30ft. channel up to the entrance of the Royal Albert Dock, as urged before the Lower Thames Navigation Commission by the London Association of Shipowners and Brokers I should like to point out that until the depth of the water over the sills of all the docks is very much increased there would be no practical advantage in forming such a channel, as vessels would have to wait at the dock entrances until the tide had risen sufficiently to enable them to enter the docks. I have here a table which I might ask the Commissioners to call upon the Engineer of the Board to explain afterwards. It shows exactly the level of the sill below Trinity high water mark, then the Admiralty low water mark, then the depth of the water in the supposed channel, and it shows that at present we allow at the Tilbury Docks 26ft. Therefore, if we could get 4ft. more at the Tilbury Docks, even as at present, we should have quite sufficient to float the largest vessels that exist. Perhaps you will allow the engineer to give that evidence more fully afterwards. He has also got a diagram to illustrate the table of the detention of ships which he handed in to you the other day, which perhaps you might like to see. It would be most undesirable for vessels of large size to be brought up in narrow parts of the river where they would cause serious obstruction to the navigation. I would also point out that there is no question of divided authority between the Trinity House and the Conservators, their duties being entirely separate and apart. Those of the Trinity House are limited to the buoying for marking channels and the lighting of the river and the control of the pilots, and they do not interfere at all with what we have to do.

1385. I will ask you first of all with regard to the constitution of your Board. Do you consider that the attendances of the members of the Board are thoroughly satisfactory?—Thoroughly satisfactory. I have never seen a Board that attended so well.

1386. I should like to know how many ship owners are on your Board?—Three.

1387. What amount of tonnage would they represent? Do any of them own large sea-going vessels? What we want to know is whether, in fact, they are or are not the largest ship-owners in London?—No, I should think not, because the P. and O. and the Orient, and some of those other lines, would be larger than our ship-owners, I should think; but they are appointed by all the ship-owners. One of them retires every year. There is an election in which I am returning officer, and the whole of the ship-owners have the right to appoint the representatives.

1388. Have you never had any representation from shipowners as to the desirability of deepening the bed of the River Thames as mentioned generally in the Report of that Commission in paragraph 35 which I have already quoted in asking questions of your secretary: "We concur then with the view of the shipowners and others that much public advantage would be gained if a navigable depth of about 30ft., suitable for vessels of the largest draught, were afforded at least up to Gravesend." That is an opinion which modifies the view which has been taken by your Board that it was not necessary to do so?—But we have not taken that view at all.

1389. Then why has nothing been done?—We have increased the depth very largely, and we have increased it to the utmost of our means. We have got no further means whatever, and as I pointed out in my evidence it was only a pious wish expressed in the Report—it was not an order.

1390. Exactly so, but it is the opinion of the ship-owners and others that public advantage would be gained?

—It is the opinion of those very large shipowners, but we have been able to point out to them that it is perfectly useless their having the river deepened beyond what we propose to do until the sills of the docks are altered, because big vessels coming up would lie outside the dock and would block the whole of the river, and it would be no use at all unless they could get in. At the present moment I think there are eight ships only that cannot come up at all tides. But we fully recognise that as the port increases the tonnage of ships will increase, and we ought to increase the accommodation. They complained that they could not come up with all tides—that they had to lose half a tide sometimes. We pointed out to them that it would be perfectly useless their being able to come up unless they could get into the docks. In fact our harbour master could not allow them to come up until they could get in, because they would block the river and upset the whole traffic.

1391. But the question is whether you as a body who are entrusted with the improvement of the navigation of the Thames should not take the lead in the matter. That is a view which may be taken?—We should like to do it if we had the money. We quite admit that it ought to be done, but I do not think it would be much use unless you make a recommendation that the dock sills should be so lowered that the ships could get in.

1392. I do not wish to say anything to disparage in any way the work which has already been done by your Board, but what strikes one is that this is the conclusion which you have arrived at since the sitting of the Commission?—Oh, no, we have always had that view.

1393. Please allow me to finish—if that resolution which you have just submitted to us is one which is desirable now, was it not equally desirable a few years ago?—I think it was, but we have no money.

1394. Have you on your Minutes any resolution similar to this or of a similar nature which would carry out your views?—No, the only resolution we have is this. It was thoroughly discussed after the Report of the Wolfe-Barry Commission—as we call it—was produced. We discussed it; we thought, as I have stated in evidence that there was no mandatory order, but still it was our duty to do all we could, and we fully looked forward that some day we should do more when we had funds. At the present moment we have carried out the ideas of this Commission as far as ever our money has allowed us to go.

1395. Then there is a point which you mentioned last of all, about the question of divided authority between the Trinity House and the Conservators. Is it not generally the case that the buoying and the dredging is in the hands of the same authority. Would it not be an advantage to have the buoying and the dredging in the hands of the same authority?—They do not buoy the river; they only buoy for marking the channels; we buoy the river.

1396. But there must be a place where the two meet. Your authority does not go the whole course of the Thames?—We go up to Yantlet Creek under our general authority and dredge up to the Nore under the authority given us by the Act of 1894.

1397. But it is no use dredging in one part of the river unless an equal amount is dredged in another part, and in consequence of your not having the whole jurisdiction, there is a hiatus, so to speak?—We have the whole jurisdiction as far as dredging is concerned up to the Nore.

1398. Up to the Nore, but not beyond?—That is the whole of the river.

1399. The whole of the river so far as the Customs is concerned, but there is another authority there. It goes further.—Well, perhaps the engineer will answer the question whether there is anything beyond that. It is rather an engineering question.

1400. The question is whether it would not be to the advantage of the Port of London that there should be unification of authority with regard to dredging and buoying the whole of the river?—We are quite willing to take it. We have never clashed with the Trinity House, as it happens.

1401. But has not the Trinity House neglected or refused to buoy the channel which was recommended in the Report of the Barry Commission?—No; not

that I know of. Perhaps you will ask the engineer that question.

1402. I think we have had it in evidence?—I do not know it.

1403. Is not that one of the results of the buoying and the dredging not being in the same hands?—Perhaps you would ask the engineer that; I do not quite know it.

1404. Then with regard to the previous recommendations of the 1879 Committee, you stated that as far as bye-laws are concerned you have carried out everything you had the power to do?—Everything we had power to do.

1405. But what at present seems not to have been carried out at all is with regard to the powers of watermen and licensing, and so on?—Yes, we had no powers.

1406. From your evidence I gather that the responsibility was taken by the Board of Trade, and the Board of Trade have never carried the Bill which they originally brought in?—Yes; they have never tried to carry it after that one time; but we are quite willing to take that duty if Parliament choose to give it us.

1407. You think it would be desirable that all these minor duties should be in one hand?—I do.

1408. Do you think that the division of the river into two parts is the best way, or is it not rather pointed out by nature and the bridges, that London Bridge should be the limit, the limit so far as the lower part of the river is concerned?—May I ask if you are speaking with regard to the management of the river, or in what way do you mean?

1409. With regard to dredging and so forth, as the funds are kept separate, do you not think the funds of the upper river should be spent from London Bridge upwards and the funds of the lower river should be spent below London Bridge?—No, I do not think that would be best, for this reason: The upper river is a poorer body than the lower river. We have quite as much as we can manage to do down to what we call the fresh water part. A good deal of scouring may be done by the tide, but there is no question that the river ought to be dealt with as a whole. It was thoroughly threshed out in 1894, and it was also brought before Mr. Ritchie again by a body in 1896, and he said it had been settled so recently and worked so well that he utterly refused to have anything to do with altering it.

1410. Do you think it satisfactory for a river like the Thames, which ought to be the great waterway of London, that at Westminster Bridge the water is so shallow that a small steamer drawing about 6ft. or 7ft. of water can only come up there at high tide?—Is that the fact?

1411. I know it is, because the Commissioners were unable to embark in your boat at Westminster Bridge in consequence of the low water, and when we started from London Bridge we grounded under the Bridge?—You were at the very lowest tide, I suppose.

1412. No. We grounded under London Bridge. We could not get up at all with your steamer. Do you think that is a satisfactory state of things for the waterway of a great city like London?—I cannot answer that question; I did not know it had occurred.

1413. I am asking you as a question of general policy. In your opinion, is it right or is it politic that the Thames waterway should be left in such a condition that large steamers carrying traffic backwards and forwards, as is done on the Seine and on other large rivers should be hindered from doing so by the depth of water at low tide—or even at high tide?—My answer to that is this. There are an enormous number of wharves and various things all up the Thames. As to everyone of those, it will have to be considered what would happen to their foundations if the river in that part was very seriously dredged. It is quite deep enough for all the trading purposes for which it is used at the present moment, and I think the amount that would have to be spent to strengthen the foundations of the whole of the wharves down the river on both sides would be so enormous that it would not answer any practical purpose. It is only the pleasure craft that is delayed a little bit; it really does not matter. All the barge traffic is perfect.

1414. I am not speaking of pleasure craft. I am speaking of the Thames as a waterway for business

men in London. At present you have no steamers on the river at all?—That is not because of its depth.

1415. The depth prevents a large steamer being run on the river?—No; I do not believe it pays. I think it is far better for the Thames to look forward to having a number of small steamers running every few minutes in the same way as they have on the Seine, rather than a number of large steamers running at very long intervals. The Thames traffic will never pay as long as you have quarter of an hour intervals while you have trains running every three minutes. What you will have to do if the Thames traffic is to be a success is to have a number of small boats running every few minutes, and not big boats that you cannot fill running every quarter of an hour.

1416. But the Seine steamers are larger than any that have ever been up the Thames?—Not for general traffic, I think.

1417. Yes, for general traffic?—The week before last I was in one of them—they call them the "Hirondelle." For general traffic the Seine is used by small steamers.

1418. But they have also large steamers?—I do not know that; I could not speak positively.

1419. We are informed—I do not know whether it is so or not—that slop from the streets is carried on to barges lying at the wharves, that is to say, between London Bridge and Westminster Bridge, or between London Bridge and the upper bridges, and after the slop is carted to the barges a plug hole is opened and a quantity of mud is allowed to flow into the river—is that so?—Certain vestries and various bodies have a right to pass from their wharves the sweepings and all manner of things from the streets into certain barges of their own, which are covered and of such a character that we do not think that anything they contain will get into the river. Many of these barges, when they have got a certain way down the river—it is not until they have gone beyond Crossness Point—then the men are so lazy that they open the plug hole, and instead of going on to Dead Man's Hole, they discharge there. We have a system of police boats to try to catch them, and when we do catch them we prosecute them for very heavy penalties. They have no right to do so, and if they do it they break the law, and we try to prevent it.

1420. But are you prepared to say with regard to the barges laden with the mud from the streets, that in none of them the plug hole is taken out, and that no mud is deposited in the river between London Bridge and the other bridges in London itself?—Not that I know of; it is deposited further on; but if they do it they do it by breaking the law and we try our best to catch them. If we catch them we always prosecute, because of course it is stopping up the river.

1421. I suppose it is difficult to detect, unless you find the water of the river discoloured?—No; we manage it in this way. A barge leaves a particular place, and we know it has to go to another place. It is watched as a rule. If it comes back before the time it could have got to that other place and back, we know that it has done something wrong. We offer large rewards, and if we get sufficient evidence we then bring them up before the Magistrates and they are punished. I think I might just mention that in that part of the river which you mentioned we are not the sanitary authority. The Port Sanitary Authority of the City of London have that part. We are not the sanitary authority for that part; the part for us is lower down the river.

1422. That leads me to ask you this. Is it not desirable that these functions should be united under one body?—I think so.

1423. That whatever is the port authority should also be the sanitary authority?—Yes; I think they should give it to us. We are quite willing to take all the duties, but we cannot take anybody else's place unless it is given to us. See 362: 5568.

1424. Now I understood from your previous witness that you have never made any inquiries as to what has been done in other ports—with regard to the deepening, say, of Antwerp, or any of the other ports competing with the Thames?—I do not know that the Board have made inquiries. I have taken some steps to inform myself on those questions. See 360-1.

1425. I suppose you know it is a matter of notoriety

that vessels have gone to Antwerp which used to come to London?—I believe so.

1426. You admit, therefore, that it is very desirable that the river should be deepened so as to enable the Port of London to compete in every way with other Continental ports, or even other ports in our own country, such as Southampton?—We certainly ought to bring the Port of London up to date, and if we only had the means we should be glad to do so. Certainly I think it ought to be done.

1427. In your evidence you stated that you "throw upon Parliamentary responsibility of giving your powers to enable you to give effect to the recommendations of the said Commission?"—Yes.

1428. That means that you are not prepared yourself to advocate any way of raising funds. Does it mean that, or have you any scheme?—Oh, we have a scheme, at least we have our ideas on the subject, but of course that must be a Parliamentary order. We cannot tax people.

1429. But what I mean is, you have the power to apply to Parliament?—We have.

1430. Have you ever had any scheme which would enable you to get the funds which you say stop you from doing what you admit are necessary improvements in the river?—Do you mean have I got a scheme that I should be prepared, if Parliament allowed us, to bring forward?

1431. Not if Parliament allowed you. It is your privilege or duty—it may be your duty—to apply to Parliament for such powers. I ask you whether you have formulated any scheme for raising such funds as would enable you to do that which you admit is desirable?—I have a scheme. You mean to raise funds in case Parliament—

1432. What I want to know is, will you go to Parliament?—No, we have not got any money to go.

1433. We want to know whether you are prepared now to go to Parliament to raise funds to enable you to do that which you admit is desirable to be done?—We are prepared with a scheme, but we are not prepared to go to Parliament. We think it ought to be a public Bill, not a private Bill. We should never be able to get the assent of everybody whom we proposed to tax. Every interest would be against us in the House of Commons, and, as you know, it is a very difficult thing to get a Bill through that treads on everybody's toes. But we are quite prepared to tell the Government what we think should be put into their Bill.

1434. But have you ever told the Government?—The Government have left the Bill untouched. We have never told them.

1435. I understand you to say that the Board of Trade have not carried out their promise; but what I want to know is have you ever approached them with regard to this other promise which you say ought to be embodied in a public Bill and not a private Bill? Have you ever approached them?—No, because we felt that unless they took it up it would have no chance.

1436. But have you ever urged them to take it up?—I have spoken privately to them.

1437. Have you ever passed any resolution as a Board?—No.

1438. Then you have never considered at all what the cost of the new works would be which you admit to be desirable?—Oh yes; we have had a rough estimate given us by our engineer, but that is a very large estimate indeed—over a million.

1439. You told us that you were frightened at it?—Well, I think Sir John Wolfe-Barry's Commission were also frightened at it.

See 5459. 1440. But we are not frightened. We want from your engineer a definite estimate of the cost of the new works to enable the river to be deepened to 30ft. up to the Victoria and Albert Docks?—To get out such an estimate would take months.

1441. We know that if engineers have to do a thing they will do it. Will you give instructions from your Board to your engineer to lay before us within two months, or even one month or any time you may fix, a definite estimate as to the cost of such work as I have mentioned?

(Witness.) How long would it take, Mr. More?

(Mr. More.) It depends on measurements, but it could not be done in two months or anything approaching that.

I think I might ask Sir John Wolfe-Barry to corroborate that.

(Witness.) It is an enormous work.

(Chairman.) Is it not merely a question of expense?

(Mr. More.) Well, it is a question of expense.

(Chairman.) And you have declined to go to the expense?

(Witness.) No, we have not declined at all.

1442. If it is not a question of expense, why have you not done it already?—Because we found that we have no more money than we are spending.

1443. Then it is a question of expense?—A question of expense in carrying it out, not a question of expense in getting the estimate. The estimate we thought would be useless until we had the money to carry it out. All we have done is to get a rough estimate, and that is between one and two millions.

1444. Do you think any Government Department would bring in a Bill unless you went to them and said: "Here is our estimate of what the thing will cost; will you bring a Bill into Parliament"?—If Government will say that they will bring in a public Bill, we will go to the trouble of getting up this estimate before the time that they want it.

1445. The question I put to you is this: You are the body responsible for the navigation of the Thames, and it is your business—at least, we imagine it would be your business—to urge on the Government to take such steps as would make the navigation of the Thames satisfactory to the ship-owners and the merchants of the Port of London?—I do not think the Government will touch it.

1446. I am only asking you—we want to know what you have done and what you propose to do?—We have done nothing.

1447. We should like to know definitely when you can give the estimate. We shall expect to have it.

(Sir John Wolfe-Barry.) We want an approximate estimate.

(Chairman.) We must have an estimate of a kind, of course, a sufficiently detailed estimate to enable us to act upon it.

1448. (Lord Revelstoke.) Would you tell us a little more fully what you mean by the words "provide the means for raising the necessary funds"?—We must have some taxation.

1449. You must have some powers?—We must have powers of some sort. We have at the present time exhausted the whole of our powers. If Parliament chose to say: "You are to have such and such sources of revenue," that would provide the means. It will be for them to say in what way those revenues are to be found for us. I told the chairman that we had our own ideas; but, of course, Parliament might not approve of them.

1450. (Sir John Wolfe-Barry.) I want to ask you one or two questions on the report of the Commission of 1896. In the first place, on page 3 you will see that the ship-owners who were before the Commission owned 500,000 tons of shipping; so that it was not an expression of opinion by a small number of people?—Oh, no.

1451. And I daresay you have had the opportunity of reading the evidence that was taken?—Well, I was a good deal in the room if you remember.

1452. At any rate, we had the evidence of all the most important lines, the British India Line, the Orient, the P. and O. Company, Shaw Saville, Scruttons, Westrays—and in fact all the principal shipowners of London came before us in 1896, and were unanimous, I think, in asking for a depth of water 30ft. up to Gravesend, and a large number of them asked for a depth of 30ft. up to the Victoria and Albert Docks?—I think so.

1453. Therefore the question was gone into by the shipowners in 1896?—The large shipowners.

1454. I mean those which I have just enumerated—the owners of large ships?—The small shipowners, as you know, are very much opposed to it. They say "we do not want to be taxed to put in rivals who will cut us out."

1455. There were other shipowners of less important lines of steamers who said "We demur altogether to be taxed for the sake of the big steamers"?—Yes.

1456. I suppose that is not unusual whenever public works are undertaken?—Yes.

1457. You said something to the Chairman just now

Sir F. D.  
Dixon-  
Hartland,  
Bart., M.P.

20 Nov. 1900.

See 1419.

about depositing material in Dead Man's Hole. Is that still going on?—No—Barrow Deep we are taking to now.

1458. Your own dredging?—Yes. I made a mistake; I ought to have said Barrow Deep. If I might correct my evidence it should be Barrow Deep. It is my mistake. The County Council and all of them go down to Barrow Deep.

1459. Then it was a mistake of yours?—Yes, it was an utter mistake.

1460. The reason I asked the question is that the Commission of 1896 demurred altogether to that proceeding?—Yes.

1461. Therefore we might take it that there is no solid sewage or detritus deposited in Dead Man's Hole?—No; it ought not to be. If it is, it is contrary to law.

1462. Then if you will refer to page 10 of the Report of 1896, paragraph 35, I think you will quite admit that within the powers that were given by Parliament to the Commission of 1896 we did all we could to induce the authorities, whoever they may be, to undertake to give a navigable depth of 30ft. up to Gravesend?—Yes, it was not within your reference; but you mentioned what you thought was right.

1463. There was no uncertain sound about the question at all?—There was no uncertain sound about what you thought ought to be done, but you did not make the recommendation, as being beyond your reference.

1464. It was beyond our powers?—Yes. You clearly showed what was in your mind, but you could not go any further.

1465. Then in paragraph 36 we say, "Above Gravesend there may possibly be some complications affecting the feasibility of any serious deepening of the river by reason of the valuable properties in places bordering its banks, and there may be questions as to the stability of the embankments which protect low-lying lands from being overflowed. These matters would require careful examination, but we have not investigated them, as the upper reaches of the river are beyond the limits of our reference." May I ask you whether that has ever been investigated by your officers? Have any plans or cross-sections or surveys been undertaken to see whether there are any valuable properties in places bordering the banks which might be affected by deepening to the depth of 30ft. up to the Royal Albert Docks?—It is all right up to the Albert Dock, but after that the difficulty commences. The only thing up to the Albert Dock is this: As you will know, in Queen Anne's reign about half of Essex was overflowed. At that time, after a great deal of trouble, there was a Commission formed and the land was all taxed. Certain river banks were formed then, which we here shall have to most carefully examine. They are in a lively state. The whole of the water which overflowed Essex in 1708 has not yet been pumped out; there is some of it left even to this day, and we should have to be very careful of what took place with regard to that part of Essex, because if half that county was flooded again it would be a very serious matter.

See 3061-70.

1466. My question was, whether the matter had been carefully investigated, and whether sections had been prepared?—No; not in that way. It has been thought over and examined, but no sections have been prepared, and nothing of a character to bring any work upon. It has been thought over as a point requiring very careful consideration.

1467. No estimates could be made, I suppose, without such works as sections and cross-sections and taking out the quantities?—I am afraid not.

1468. And similarly it is impossible to say what the effect on the stability of embankments or properties would be without making surveys?—I am afraid so.

1469. Mr. More, your engineer, said that he had satisfied himself that there was no difficulty or danger in providing a channel of 30ft. up to the Royal Albert Docks?—It is only a question of money for protecting these parts. It can be done.

1470. Then may I take it that Mr. More's answer is to be qualified to this extent, that there might be other works necessary in order to protect the stability of properties and banks?—Mr. More will answer that himself when you see him presently, but we understand that it may be found, when the surveys which you mention are made, that very considerable works on the Essex coast may be necessary.

1471. May I take it in this way: that so far as the

actual cost is concerned, the Thames Conservancy have never had before them any detailed or careful estimate of the works that would be necessary either to carry out the undertaking recommended up to Gravesend, or the works above Gravesend?—No, we were told that it was such an enormous sum that it was useless our going into it, because we had no powers.

1472. But why should anybody say it was such an enormous sum without enquiring what the sum was?—You must remember that we are a poor body.

1473. Then I should have thought it was more necessary for you to count the cost?—We have an enormous amount of work to do, and every penny we can use for dredging is more useful than getting out particulars for work which we knew we were unable to do.

1474. At any rate, you are going to do it, I presume? See 545—Do you mean for this Commission?

1475. (*Chairman.*) Yes, we ask you to do it?—I know; but it will take months to do. We shall have to call in some of the most eminent engineers to help us. It is an enormous question. I should like Sir John Wolfe-Barry to be called in to help us with regard to what is the best way to protect the banks.

1476. (*Sir John Wolfe-Barry.*) You understand that what the Commission wants is something like such an estimate as you would have to submit to Parliament—not absolutely binding you to any particular sum, but an approximation to the cost which is involved by an undertaking to do the works?—Of course, I have no doubt that the Board will at once bow to the wish of this Commission, and will get the work out to lay before you. I have no doubt the Board will try to meet the Commission.

1477. What we have in our minds is such an estimate as is generally prepared by engineers for submission to Parliament. We all know that those estimates are generally prepared in from two to three months without any difficulty?—Perhaps you will ask the engineer about that. It is an engineering question, and I can hardly answer it.

1478. At any rate, you will do all you can to let us have that estimate?—I shall certainly bring it before the Board and recommend it on Monday.

1479. (*Chairman.*) You will recommend it to be done before the meeting of Parliament—before next February?—That you must ask the engineer. I cannot say that.

1480. (*Mr. Ellis.*) You heard Sir John Wolfe-Barry say two or three months?—Yes, I heard that, but of course I am not an engineer, and cannot give any answer about that.

1481. (*Sir John Wolfe-Barry.*) Perhaps, as we are going through the report now, I may refer you to paragraph 47, where the Commissioners say: "If the desired depth of 30ft. at low water of spring tides, or something approaching it, is to be maintained permanently and economically through these shoals"—that is the "Leigh Middle shoals"—"the chief work for effecting the purpose should consist of a tidal training bank extending in a suitable direction eastward from Canvey Island, in order to direct and control the currents and prevent in the future such divagations of the channels as have occurred in the past. We are of opinion that no injury would be caused to the Benfleet or other creeks by such a work, but that an improvement to them would result." Then paragraph 48 says: "We think it is unnecessary at the present moment to consider in detail the design of such a work as we have indicated, or its cost, and desire to confine ourselves now to stating that the undertaking does not present any serious difficulties." Has the engineer checked that at all, or prepared any plans for such a work?—No; we took it in this way. You gave no mandatory order beyond your reference, and as we knew we had no money, we did not spend any money in getting estimates for work which we had no power of doing. We quite take the principle that it ought to be done.

1482. As a matter of fact, the particular work was inside our limits?—Was this within your limits?

1483. Yes?—We did not know that, and you did not make any order. I admit that we quite understood what was in your mind; but we had no order, and we found that we had not the money.

1484. With regard to money, I would ask you this: Is it not usual for Conservancy Boards of great rivers,

when they want money, to prepare a scheme for Parliament and apply for money?—I do not know.

1485. Take the case of Glasgow?—I do not know.

1486. I will put the case of Glasgow, or the case of the Tyne, or the case of the Tees?—As far as the Tyne is concerned, if my memory serves me, a Commission sat upon the Tyne, and they went so far as to suggest that it was so important that the Government should give them a certain sum for nothing, and that they should let them have another very large sum at a very low rate of interest.

1487. That was for a harbour of refuge?—But that was necessary for the river, and although the works have been carried out, the Government have never given them any money, or given them any at a low rate of interest; so it did not give us the idea that it would do any good.

1488. I think I am right in saying that the suggested contribution from the Government in the case of the Tyne was in respect of a harbour of refuge, and had nothing to do with the trading aspect of the Tyne?—But, as I understood, it was part of the whole river scheme.

1489. However, I think you will not deny that other Conservancy Boards have always been the initiatory body to propound schemes for improving their river?—Unfortunately, I know so much about the House of Commons that I know it would be perfectly impossible for a private body to tread upon everybody's toes, as we should, with any hope of success.

1490. (Chairman.) You are a public body?—I meant for any body but a Government body. I know it would be perfectly impossible to get the taxation unless the Government would take it up. As the Chairman put it, if we had approached the Government, they might have taken it up, and we might have had a scheme; but with regard to our introducing a Bill it would be perfectly illusory, I am convinced.

1491. (Sir John Wolfe-Barry.) You did introduce a Bill in 1894?—Yes, but that was by order of the House. We could not help ourselves.

1492. You introduced a Bill?—By order of the House.

1493. Very likely; but the clause that was inserted in the Bill contemplated your applying to Parliament. It said so most distinctly?—In case you gave certain orders which you did not give.

1494. Then the only difference was whether the order was mandatory or recommendatory?—I think the words are a little stronger, are they not?

1495. (Chairman.) I will ask you to go back to the paragraph I quoted, paragraph 35. It may be qualified afterwards, but that is where the principle is laid down. I want to pin you to that?—Paragraph 49 seems to govern it altogether: "Having come with some regret to the conclusion that works in the river between Thorney Creek and the Nore cannot at present be recommended, we have found it unnecessary to proceed with the second branch of our inquiry," and so on. Then it says: "It seems to us that the financial powers of the Conservators, whenever the fitting time arrives for undertaking the works, should be dealt with as a whole." Paragraph 49 seems the governing clause, to our mind.

1496. It might be said that paragraph 49 suggests that there are certain difficulties in the way, but paragraph 35 is the one to look at?—Paragraph 35 speaks of going to Gravesend, which was quite outside the Reference. They could only give the order within the Reference.

1497. And that, of course, made it difficult for them to recommend it being done; but there is no question about it, if you read it as plain English. They came to the conclusion that the shipowners wanted what is stated in paragraph 35?—Quite so. We admit that point.

1498. That is the point the Commission want to press?—We admit that point; that it was evidently the wish of the Wolfe-Barry Commission that it should be done, but they did not give the order, and having no money we felt we would do all we could, but we could not go any further.

1499. (Sir John Wolfe-Barry.) Paragraph 37 says this, "Strictly speaking also the river between Thorney

Creek and Gravesend has not as we have mentioned, been referred to us, but this length of the river is so intimately connected with the questions affecting the Leigh Middle Shoals that we have felt it our duty to investigate its condition, and we have satisfied ourselves that, apart from any question affecting the Leigh Middle Shoals the river from Thorney Creek upwards to Gravesend might be easily and cheaply deepened to the extent of providing a channel sufficient for the passage of the largest vessels trading to the Port of London at all states of the tide, and that such an improvement could be maintained at comparatively small expense"?—Since your Report has been issued we have provided a channel 1,000ft. wide and 26ft. deep which will bring up at all states of the tide every vessel except about eight to Gravesend. We have done our best.

1500. You have adopted 26ft. instead of 30ft.?—Yes. We had not money enough to do 30ft.

1501. With regard to paragraph 56 of the Report, is the jurisdiction of the Thames Conservancy now extended as far seaward as the Nore?—As far as dredging is concerned.

1502. But in no other respect?—No, only as far as regards dredging.

1503. Have the dredging powers been extended in consequence of the Report of 1896?—No, it is in the 1894 Act.

1504. Therefore this recommendation was over and above the question of dredging?—Yes. You may take it from me that we have, as far as we could, and as far as our money went, entered into the spirit of your Report. We saw your mind in it, and as far as we possibly could we have carried that mind out, but there was no mandatory order. The only thing we have not done is this. We knew we could not go to Parliament without spending £10,000 or £12,000, and that we should probably get nothing for it; and we have not done that. That is how we stand.

1505. Therefore we may take it in this way that for any works or matters requiring Parliamentary sanction nothing has been done?—No. It is only the question of funds. We have got powers to do the whole of the other things.

1506. My question was things and matters requiring Parliamentary sanction?—We want no Parliamentary sanction, but money.

1507. But I say that anything requiring Parliamentary sanction is in exactly the same position as it was in 1896?—Yes.

1508. Can you tell us how long it will be before the channels referred to in your evidence are completed, or shall I keep that question for Mr. More?—Perhaps you had better keep that question for Mr. More. I could only give secondhand evidence with regard to it.

1509. And I suppose you cannot tell us how much has been spent?—I think £24,000. It has been put in evidence.

1510. You have some unexhausted borrowing powers to a small extent?—Yes, very small—nearly £100,000.

1511. Then I suppose that, following the analogy of other conservancy boards, if any works are undertaken you will have to go to Parliament to borrow money?—There must be a Bill in Parliament. Whether we shall have to go is another question.

1512. Somehow or other Parliament will have to be asked to authorise a loan secured in some way on the tolls on shipping using the Thames?—Yes, or by some other means.

1513. Whatever works have to be undertaken will have to be undertaken by means of a loan authorised by Parliament?—No, it does not follow. Parliament must provide some means of paying the interest on that loan. We should be utterly unable to get any more money on the present income of the Conservancy Board; the market would not take any more.

1514. Your income at present is arising from a toll on the shipping using the Thames, is it not?—Principally—it was £55,000 last year.

1515. That toll is, I think I am right in saying,  $\frac{1}{2}$ d. a ton?— $\frac{1}{2}$ d. or  $\frac{3}{4}$ d.—it goes up to  $\frac{3}{4}$ d.

1516. (Chairman.) It is mostly  $\frac{1}{2}$ d., I think?—Yes, it is mostly  $\frac{1}{2}$ d.

1517. (Sir John Wolfe-Barry.) Do you see any particular reason why the tolls should be so low on the

Sir F. D.  
Dixon-  
Harland,

20 ov. 1900.*

shipping of the Thames compared with what we have been told is the toll upon the shipping of other rivers?—The only reason we see why it should be increased is because, as you have already said, it is of the greatest importance that no financial burden should be placed so as to damage the commercial interests of the Port of London. The more you put on to the shipping, of course the less chance there will be of shipping coming up.

1518. What does the  $\frac{1}{4}$ d. toll produce—£55,000 a year?—£55,000 we received last year. When I was first Chairman we were receiving £48,000. We have tried to promote trade, and it has now risen to £55,000.

1519. Recognising very fully that nothing should be done to damage the commercial importance of the Port of London, do you say that that toll could not possibly be increased?—I should not quite say that, but I think there are other means that we could get which would be cheaper.

1520. The Commission would like very much to know what your view would be as to a possible increase in the tolls on shipping?—I think there would be a possibility but I am not sure that we should get anything out of it, because if we got the tolls upon a certain number of ships and then the tonnage falls off, the one is as broad as the other; but if we had another system of taxation, which I have thought out, then it would not interfere in the same way.

1521. Then you think there are means which could be suggested for raising the money without laying such a financial burden upon shipping?—I do.

1522. Are you going to lay that before the Commission?—If you wish it.

1523. (*Chairman.*) Have you put it before your Board?—Yes, I have.

1524. I think it is desirable that we should have anything that has been put before your Board?—I am quite prepared to give it if you wish, but it was not my business to force upon the Commission any view of my own, I thought, unless I was asked for it.

1525. (*Sir John Wolfe-Barry.*) May I ask upon what capital expenditure the estimate of income has been arrived at?—I do not quite follow you.

1526. You say you have arrived at some proposal which would find the necessary funds for executing the works which the Thames Conservancy admit are necessary for bringing the river up to date?—Yes.

1527. Can you tell us on what capital expenditure the calculation is based?—I can hardly put it in that way. I know exactly what I propose, and I know what we think it will bring in, but I do not know exactly on what capital expenditure it is based.

1527A. Then I will put it in that way. What additional income would it bring in?—We consider that in all probability it would bring in about £150,000 a year.

1528. Over and above what you have now?—Yes, that is our belief.

1529. (*Mr. Ellis.*) I want to ask you a few questions as to the Parliamentary history of Section 189. You were in charge of the Bill of 1894 in the House of Commons?—Yes.

1530. And on the 5th April you moved the Second Reading?—Yes, if you say that was the date.

1531. You may take it that those dates are from the records. Then nothing occurred on the Second Reading debate except the instruction that was moved by Mr. Stuart in respect of water, which you accepted?—I think so.

1532. Then the Bill was referred to a private Bill Committee, of which Mr. Jackson was the chairman?—Yes, it sat for 29 days, I think.

1533. While they were sitting, and when they had made considerable progress, on the 28th May I think, Sir Thomas Sutherland, then a member of the House, gave an instruction with regard to the dredging?—Yes, and I spoke upon it, if I remember rightly.

1534. And you on behalf of the Thames Conservancy Board were unwilling to accept it?—Yes.

1535. You opposed it?—Yes.

1536. A division was taken?—Yes.

1537. Of course it was a purely non-political matter?—Yes.

1538. I see from the record that the instruction was carried by 269 as against 112?—I did not remember that it was carried.

1539. Yes it was. That came down to the Committee, of course, being an instruction to do certain things with respect to dredging?—I do not remember exactly the words.

1540. I will read it. It was a very important instruction. On the 28th May, 1894, Sir Thomas Sutherland moved: "That it be an instruction to the Committee on the Thames Conservancy Bill that they have power to insert in the Bill, if they think fit, provisions for authorising the Conservancy to dredge the portions of the River Thames and the estuary thereof below Yantlet Creek in the County of Kent?"—Yes, I remember now.

1541. As I have said, you objected to that on the grounds which you then gave?—Yes.

1542. But the House of Commons approved of it, and it came down to the Committee?—Yes.

1543. Then in the Committee of which Mr. Jackson (the member for Leeds, of course), as I have said, was chairman, Mr. Pember, the counsel for the ship-owners, made a proposal on the 31st May with respect to this?—He represented the ship-owners, did he not?

1544. Yes, he represented the ship-owners on that occasion. He represented other interests, but at that moment he was speaking for the ship-owners. He made certain proposals in a long speech on the subject, and your counsel, Mr. Littler, on the same day made a suggestion, and it is to that suggestion that I wish to draw your attention. This is you, the Thames Conservancy Board, speaking through the mouth of Mr. Littler. The words which Mr. Littler used are, first: "We will be prepared to insert in the Bill power for the Conservators to dredge within the limits stated by Mr. Pember yesterday"—that was carrying out the suggestion of the House of Commons?—We got those powers.

1545. "And to such an extent as shall be recommended by the Board of Trade after such inquiry and report as hereinafter provided?"—That is put in.

1546. We will go through the steps, if you please. You will see my object. I want to get on the notes of this Commission the Parliamentary history of this section 189, through you. That was the proposal of your counsel. They accepted the duty cast upon them by the House of Commons. You were unwilling to do so on the 28th May, but on the 31st they accepted the duty on certain terms?—Yes.

1547. I need not go on to read those terms, but they contain the suggested clauses for the Bill. The next important step was on the 4th June, when the Permanent Secretary to the Board of Trade, Sir Courtenay Boyle, came before the Committee at its request. Of course, the Chairman of the Committee remarked that they could not impose a duty on the Board of Trade without communicating with the Board of Trade. They did communicate with the Board of Trade and Sir Courtenay Boyle came at the request of the Committee. I have here the notes of his evidence. On the 4th June, 1894, he takes the matter a little further. He alters your suggestion, that the Board of Trade should make an inquiry and then do something, into the form that after a Commission had made an inquiry you should do something. Do you see the vital change?—Yes.

1548. He withdraws the Board of Trade. You accept my view of it?—Yes.

1549. Therefore the Commission created by Section 189 was put in the place of the Board of Trade?—Only as to a certain reference.

1550. But as to its recommendations?—Yes, I think so.

1551. The Board of Trade stood aside and such a Commission was to be appointed whose recommendations should be of the same force as the Government Department's?—Yes, as far as their references went.

1552. I want to carry you with me. Do you accept that?—Yes, I think so.

1553. That is how it stood when Sir Courtenay Boyle left the Committee. The precise clause was brought up by Mr. Baggallay on the 19th June, as Clause 181B?—That is section 189 now.

1554. Yes. And after some conversation between counsel and various negotiations, which always take place in a Parliamentary Committee, it assumed its final shape in the form in which it stands in the Act of Parliament?—I understand so.

1555. It left our House in that shape, and was not amended in any respect in the House of Lords?—I understand so.

1556. It stands in the Act of Parliament precisely as the Chairman read it?—Yes.

1557. Do you really wish to put before us that that clause is not what we call in the House of Commons mandatory?—The clause is mandatory here, but what we say is that the Commission did not give us the order under it which they could have done.

1558. Then it is not that you do not admit for a moment that you have failed to carry out the mandate of Parliament in an Act of Parliament, but that the Report of the Commission was, as you have phrased it in your evidence, of an inconclusive character?—Yes.

1559. And it is upon that that you base your omission to do anything up to now?—I do not admit that we have not done anything. We have not gone to 30ft., but we have gone to 26ft.

1560. Anything that you have not done is in consequence of what is to your mind the inconclusive Report of the Commission. Is that so?—If the Commission had given us an actual order we should then have had to say, "We cannot do this; we have no money," and we then must go to Parliament to get money to do it. But as we had no particular order, and as you know it is very difficult to get an Act when there is any taxation to impose, we knew we should be throwing a lot of money away and we could not get anything.

1561. May I call your attention to this statement by one of your counsel. On the 12th June, in the Parliamentary Committee Room, on your behalf, Mr. Bidder states this: "If the works require additional Parliamentary powers they are bound to come to Parliament. If they do not come to Parliament it is an omission on their part; but the works are within their present powers, and if they were to stand still and do nothing, that would place them absolutely in the wrong box"—We have not stood still and done nothing.

1562. You say in reply to that, that all that is within your powers you have done?—Yes. We could go any depth you like. We could go to 100ft. as far as power is concerned, but all that we have powers to do and orders to do we have done.

1563. There was a good deal of conversation between the chairman and the counsel as to whether the word "duty" should be put in the Act of Parliament. You will remember that probably?—Will you let me say this: I was not chairman at that time, and I had not the framing of the policy of the Board at that time. I remember that a good deal of what you say took place, but it was not under my initiative in any way.

1564. Who was chairman at that time?—There was no chairman at that time. There was a deputy chairman. The Lord Mayor was chairman *ex officio*, and Sir Frederick Nicolson was deputy chairman; but I was the first chairman of the Board under the Act.

1565. Then you rather suggest that when the matter was before the Committee there was no authorised head?—No, there was an authorised head, but I was not the authorised head and I was not the guiding spirit. Sir Frederick Nicolson was really chairman. I only mean that I was not chairman, and therefore I was not responsible for the action of the Board. I only heard what took place.

1566. As I understand, you briefly say that it is due to the inconclusive nature of this report that you have not done anything?—No, I did not quite put it in that way.

1567. I want it in your own words?—I put it in this way. That we did see between the lines what was the wish of that Commission, though it was not strictly within their Reference. If it had been within their Reference, and they had given us orders to do it, we had no option; but as it was not in their Reference, and they distinctly in paragraph 49 gave us no orders whatever, we felt that it would be foolish for us to go to Parliament, and all that we could do was to try and carry out the wishes of that Commission with the means we had.

1568. But in some way or other certain work has not been done?—No, it has not been done.

1569. And you admit that it is desirable it should be done?—I think so, and anything we can do to bring the river up to date we shall be willing to do and glad to do.

1570. Now, I will take you for a moment to finance.

You have revenues, as I gather from the statement you have been good enough to lay before us, arising from various interests. Has there ever been on the Board—I will not use the word "friction"—a question between the interests represented on the Board as to the allocation of those funds. You understand what I mean. For instance, one interest might say: "The money comes from our district; we must have it spent in our district; not elsewhere"—The Act of Parliament declares that all the money of the Upper River shall be spent on the Upper River, and all the money of the Lower River shall be spent on the Lower River. We cannot interfere in any shape or form, and there has been no friction in any shape or form. It has all gone as authorised by the Act of Parliament.

1571. Then there has been no question?—No. The only question has been that sometimes the Upper River has said: "We should like to have a little more dredging than we have been able to get"—nothing more than that.

1572. I see you have charged something for river frontages?—Yes.

1573. Have you any scale for those river frontages applicable all down the river?—The Act of Parliament is that we are obliged to have an assessor. We appoint an assessor who has to be approved of by the Board of Trade. That assessor ever since I have been chairman has been Mr. Clutton. In the case of an application when we tell Mr. Clutton that as far as navigation is concerned we consent to it, he assesses what the people have to pay to us, either as a fine or as rent for having the accommodation.

1574. But is it an individual assessment, or does it proceed upon any basis or scale?—It says in the Act that it shall be deemed to be the true and fair worth or value thereof to the person obtaining a license or permission. Sometimes we tell Mr. Clutton that he has not charged enough, but pretty generally he sticks to what he has said and we cannot get anything more out of him.

1575. Then some question has arisen sometimes even at your Board?—No—between myself and Mr. Clutton. I have told him I do not think he has charged enough in some cases.

1576. Has any question arisen as between man and man, or as between neighbour and neighbour that you know of?—No, not between neighbour and neighbour that I know of. Of course, we always ask the views of the neighbours on both sides, and examine their complaints, if any, in order that we may not injure anybody at all before we grant the leave, before it comes to Mr. Clutton.

1577. In fact, we may take it from you that it is done by a highly competent individual?—Yes.

1578. Then in your statement you rather play off, if I may use the term, the sills against the depth. You say it is no use deepening the river because of the sills?—Yes.

1579. Is it the mind of the Conservancy that they must wait to deepen the river until the dock companies have done their part?—What is the good of deepening the river until the vessels can use it? At the present moment when the river is at a certain height of the tide, they can all get into the docks, and if the depth were lowered to 30ft. they could get in no better.

1580. But, if I might say so, might not the dock companies say, "What is the good of our altering our sills until the Conservancy do their part?" Is A to wait for B, or B to wait for A?—If you give a recommendation that the docks should be obliged to lower their sills, I suppose they will do so. We cannot make them, and they say they will not do it.

1581. If I might call your attention again to the evidence given before that Committee, do you recollect that your counsel, Mr. Littler, said that a great mistake was made in the Ribble by not treating the river before the docks were made?—I do not remember that, but I dare say he did.

1582. Is it your view that we are to wait for the docks?—No, our view is that we ought to deepen the river at once if we get the money.

1583. Then it comes to a question of funds?—It really comes to a question of funds.

1584. Then, with regard to the constitution, do you wish us to infer that it is the best of all possible constitutions?—In my opinion it is the best we could

Sir F. D.  
Dixon-  
Hartland,  
Bart., M.P.  
20 Nov. 1900.

*Sir F. D. Dixon-Hartland, Bart., M.P.* possibly have. The Admiralty are represented, the London County Council are represented, and also Trinity House, the City, the dock owners, the wharfingers, —

20 Nov. 1900.

1595. It has on it the representatives of a good many interests, and it has worked very well, you think?—Yes, we have found it has worked very well, and they all give us the best information upon points they are best able to speak upon.

See 2062.

1586. You recollect that Sir Thomas Sutherland moved an instruction with regard to the constitution?—I think Sir Thomas Sutherland has altered his views a good deal. I know you are going to have him here.

1587. Then we will have his views from him himself. Now I come to the vital part of the whole matter. What is your recent action, and what is your present mind? In the first place, you have read the evidence given before us by your officers?—Yes.

1588. You will remember that the Secretary told us that the matter had never been considered before the Commission?—That is a misunderstanding.

1589. It is question 98?—The question that was asked was: "Has any action been taken with regard to this Commission?" The answer ought to have been: "They have not discussed any policy with regard to the subject matter of the reference to the Commission"—not that we had not discussed any general policy—because our general policy has been discussed every year. Of course we have an admirable Secretary, but he is a comparatively new man.

1590. In Question 98 does the witness take "the Commission" to mean this Commission?—Yes.

1591. Not the Lower Thames Navigation Commission?—No; this Commission. Long before he came it was discussed over and over again. It ought to have been, "with regard to this Commission."

1592. The Board of Trade Commission?—No; he did not mean that.

1593. (*Chairman.*) Upon that I asked whether you would furnish us with the minute books in order that we might see exactly what had taken place since 1896; so it is evident from my asking that that I was speaking of the Commission of 1896?—He did not understand it in that way.

1594. (*Mr. Ellis.*) Then I must take you to Question 166; that is in the evidence of Mr. Hughes, the solicitor. I gather from the answers to Questions 166 and 167 that your Board had not discussed its relations to Sir John Wolfe-Barry's Commission with regard to going to Parliament?—We had discussed them, but after discussion we felt that we could not go to Parliament.

1595. Then there have been proceedings before your Board?—There were constant discussions, and it was taken as being not mandatory, and, having no money, that all we could do was to do our best.

1596. Now you have taken what strikes me as a new departure. In your evidence you say the Conservators had recently considered the subject matter of the reference to the Commission. Now give me a date, if you please?—Since the 12th November. We have done it in this way. If you remember, you asked us to give evidence by a certain day, and we wrote back to say that we were prepared for our officers to come and give formal evidence, but we asked leave, on the question of policy, to be allowed to give that evidence later. Then we got a letter saying that you wished us to give our evidence with regard to policy at once, and when you said that, I assumed it was my duty to bring it before the Board instantly, and to ask whether it would be right to say that what had been our general policy should be our future policy.

1597. Can you give us a date for that?—Last Monday week.

1598. Have you the Minute Book?—Yes. As you have not asked me the question about what we propose about putting the taxation on, we ought not to show you this at present.

1599. I am not going into that?—This is the exact minute. (*The Minute Book was handed to Mr. Ellis.*)

1600. This was on the 12th day of November?—Yes, last Monday week.

1601. "The Chairman at the request of the Board then laid before them his views as embodied in the

following proposals." Then this is the resolution. Was it passed unanimously?—Yes.

1602. "That the Conservators, whilst not admitting that the Report of the Lower Thames Navigation Commission, dated 25th March, 1896, contained a specific recommendation that a navigable channel of 30ft. below low water of spring tides should be provided up to Gravesend, are prepared, in view of the tendency to constantly increase the size and draught of ocean going steamers, to take measures to make such a channel, having due regard to the security of the banks and wharves of the river, provided Parliament will grant them power to raise the necessary funds." Is that the only definite resolution or minute on your books arising out of the Wolfe-Barry Commission?—Yes, I should think so.

1603. Then up to the 15th November, 1900, and until this Commission began to sit in this room, nothing of a definite or practical character had been done?—Oh, yes; we have increased the depth of the river. You can ask the engineer as to that. We have increased the depth very much and spent a very large sum in doing it.

1604. (*Chairman.*) I think I understood you to say that you had discussions, and that you deepened the river under certain resolutions?—Yes, that was in 1896.

1605. But what we want to know is, are we under the right impression that until this last meeting on Monday week you had taken no steps at all by any resolution of your Board to do more than your ordinary dredging?—Oh, no, we took—

1606. Will you give us the resolution on which you deepened the river down to 26ft., because that is what we want. We want to know when you did that?—On the 22nd June, 1896, the Lower River Committee recommended and it was adopted by the Board: "That the Conservators adopt the scheme in the engineer's report for widening and deepening the channel of the river as follows: from the Nore to Gravesend, 1,000ft., 26ft. deep; from Gravesend to Crayfordness, 1,000ft., 24ft. deep; from Crayfordness to the Royal Albert Dock 500ft., 22ft. deep; from the Royal Albert Dock to Mill-wall 300ft., 18ft. deep." That is what is mentioned in my evidence. That was a very large work to bring up, and I think it cost us £24,000 or £26,000. I am told it was more than that. It was a very large sum—I forget the exact amount.

1607. Then it is upon that resolution of 1896 that you have acted up to last Monday week?—Yes, and we do not consider that Monday week alters this in any shape or form. It only shows that we are perfectly willing to go to the 30ft. recommended, if we can get the money. It is the same principle. The policy has been the same all through, but we have not got the money. We are quite prepared to accept the 30ft. if we have the funds.

1608. (*Mr. Ellis.*) At all events on the 12th November, 1900, you arrived at a definite point that you had never arrived at before?—Not in words. We always understood that we were trying to do it if we could get the money. I will put it in this way. Suppose the shipping had come in so much that our funds had been raised to a sufficient sum, we should have gone on to the 30ft. deep if we had had the money.

1609. The whole thing is summed up in finance?—Yes, that is so.

1610. Then you put in this proviso which was really unnecessary:—"Provided we had the necessary funds." Of course, if Parliament says you have to do it you must do it, and if Parliament does not say you have to do it, *cadit questio*?—That is so, but it shows our wish.

1611. Quite so; one will not suggest that it has been stimulated by the appointment of this Commission, but there it is?—Yes. I do not think we should have considered it until we got the funds if it had not been for the Commission.

1612. Now I want to know what you are going to do with this. Are you going to deposit a Bill?—No, we have no money. I should like to accept the Chairman's suggestion that we should approach the Government and tell them what we think ought to be done. See 7485-97.

1613. (*Chairman.*) I suggested that you ought to have done that long ago?—You did, but we consider that that suggestion is the right one, and we certainly propose to take it up.

1614. (*Mr. Ellis.*) I want to get from you as the Chairman of this most important public body, what is in your minds. You passed a resolution on Monday week; what

are you going to do upon that?—I shall do what the Chairman suggested to-day that we ought to have done.

1615. But it is really not for us, as a Royal Commission, to suggest anything?—I will bring it before the Board—

1616. You say "I." Is the Board going to do it?—I will bring it before the Board, and ask leave that we should approach the Government on the whole question, telling them what we think ought to be done, and telling them the way in which we consider the funds should be got.

1617. That is the view in which you translate your own phrase that the River Thames should be "brought up to date"—that you will ask the leave of the Board to apply to Parliament?—Not to go to Parliament; we shall go straight to the Government.

1618. You will put it before the Board and ask leave?—Yes.

1619. Suppose the Government says:—"This must be introduced as a Private Bill, and we do not meddle with Private Bills"?—Then I should say at once:—"We cannot do it; we shall get no money; we cannot do it." You know we could not get a penny.

1620. I should be very sorry to pledge myself that you could, but may I ask you this? You think that the whole matter depends—the matter of the bringing up to date of the Port of London—on the introduction of a Bill in the shape of a public rather than a private Bill?—Yes.

1621. That is your answer as Chairman of the Thames Conservancy?—I do not think we should have a chance of passing a private Bill. We should get no taxation.

1622. Is that your final answer to us as a Royal Commission?—Yes.

1623. That is the answer you give us on behalf of the Thames Conservancy?—My own idea is that if we brought in a private Bill to put on taxation—and we have all the other powers except taxation—we should be fought by every interest that we touched, all the people would go to their various members in the House of Commons to protect their interests, and we should have no more chance of passing the Bill than we have of going up to the moon.

1624. You mean, to put it briefly, it is only the Government whips that could carry the thing through?—I think so.

1625. (*Rear-Admiral Hext.*) You stated just now that the Conservancy had carried out the recommendations of the Commission of 1896 as far as money allowed them to do so?—Yes.

1626. How do you account for your having for those three years 1897-8-9—since 1896—a surplus in the Below Bridge Funds of £41,408?—I know of no such surplus.

1627. Your accounts show it. You have a surplus in your funds which you have not spent, and which might apparently, so far as one can see, have been spent. Your accounts show that quite clearly?—The amount that has really been surplus in the years 1895 to 1899 is £51,525, but the whole of that has gone in capital works. The dredging which I have mentioned comes out of that—whatever sum was spent. We spent, taking out from capital £36,133, and from reserve income £40,963, or a total of £77,096, against the £51,525 which we had over surplus. It is all gone.

1628. Then this account must be an incorrect one. If you look at the summary of your accounts you will see there: "Reserve below London Bridge for 1897-8-9, total, £200,742." I have taken it since the recommendations of the 1896 Commission. Below that you will see the expenditure: I am taking the expenditure for 1897-8-9. The expenditure amounts to £159,334, leaving a surplus of £41,408?—The real balance left is £51,525, taking the six years from 1894 to 1899.

1629. I particularly wanted those three years to show what you have expended since the recommendations of the 1896 Commission?—The whole of it has gone in general works. It has all been carried to reserve income account, and the whole of it has gone in capital charges, including this dredging. We have spent, in fact, more than we have received. We have had to spend from new capital £36,133.

1630. Could you give the Commission the proportion from your revenue which you spent annually on dredging for those three years?—Dredging in the Lower River or the Upper River?

1631. The Lower River?—You wish particulars of the three years' dredging below London Bridge?

1632. The figure I wanted to arrive at is the actual cost in dredging. Will you apportion the cost of the dredging to your income for 1897-8-9, not including new plant. I want the actual money spent in dredging?—The dredging for the Lower River in 1897 amounted to £11,200 about; in 1898, to £13,600; in 1899, £25,200.

1633. (*Chairman.*) That does not correspond with the figures in your return?—That is the dredging.

1634. That is the dredging pure and simple?—Dredging pure and simple.

1635. (*Rear-Admiral Hext.*) Not only charges for plant?—No; here it is put "dredging" pure and simple. This is what comes out of revenue.

1636. (*Sir Robert Giffen.*) You are speaking now of the lower river?—The lower river only.

1637. That is below Staines?—Below Staines.

1638. (*Rear-Admiral Hext.*) But I have a return here showing expenditure below London Bridge?—I can give you that, too. Below London Bridge in 1897 it is £10,189; in 1898, £12,302; in 1899, £24,037. That is below London Bridge. In fact, the dredging below London Bridge for the six years since the Act.

1639. I want you to confine it to the years since the recommendations of the 1896 Commission?—I have given you that. That was what we charged out of revenue. That does not include what we charged out of capital.

1640. I wanted the proportion between your income for six years. You might submit a small table showing the proportion spent on dredging with reference to your maximum income derived from the Lower Thames.—The percentage out of revenue is 27.7.

1641. Was any regular continuous survey of the river undertaken before the recommendation of the Commission of 1896?—Perhaps you will ask the engineer that.

1642. With reference to paragraph 39 of the Report of the Commission of 1896, who was responsible for the spoil being deposited in Dead Man's Hole?—Do you mean ours, or the spoil from other people?

1643. The dredging taken by the Conservancy?—We send our own hoppers.

1644. But who was responsible for recommending that site?—If my memory serves me, the Board of Trade said that they had had enough put in Dead Man's Hole, and they insisted that in the future it should all go down to the Barrow Deep.

1645. It says here: "It appears that since 1878 the Conservancy have deposited in a part of this deep water which is marked out by beacons and measures, 200,000 square yards, more than 2,000,000 cubic yards of waste dredgings." That was from 1878 up to the Report of the 1896 Commission. My question was, can you tell me who was responsible for the spoil being deposited there?—No, I do not know. I dare say the engineer may tell you that.

1646. It is stated that the deposit from the spoil commenced in 1878. Was any survey made to see if the deposit of 2,000,000 cubic yards of waste dredging in an area of only 200,000 square yards altered the bed of the river in any way?—These are all engineering questions. I am afraid I cannot answer that.

1647. You would rather I asked the engineer as to that?—If you please. They are questions that I cannot answer.

1648. Then you said at the end of your evidence that there is no divided authority between the Trinity House and the Conservators?—Just so.

1649. Do the Trinity House buoy the channels within the Conservancy jurisdiction without reference to the Conservancy?—I believe so. Perhaps you will ask the engineer that. These are all engineering questions.

1650. You say there is no difference of opinion between the two?—Yes; there has been no difference of opinion between us. We act perfectly harmoniously. We have got their representatives on our board, and we have never had any difference of opinion. That I can say.

1651. I will ask you these questions, and if you cannot answer them, you will refer me to the engineer:

Sir F. D.  
Dixon-  
Hartland,  
Bart., M.P.

20 Nov. 1900.

*Sir F. D.  
Dixon-  
Hurland,  
Bart., M.P.*

29 Nov. 1900.

See 8509-10.

Do the Conservancy send their plans of dredging operations officially to the Board?—I do not know.

1652. The Yantlet Creek channel having been deepened, can you explain why the Trinity House did not buoy it?—I do not know.

1653. Did they tell you why they did not buoy it?—I do not know. These are all engineering questions.

1654. (*Sir Robert Giffen.*) You make an annual report to Parliament, do you not?—Yes.

1655. Have you taken the opportunity of that annual report to call the attention of Parliament and the public to the deficiencies of the river, and to what is necessary to be done in order to bring it up to date?—I do not remember that we have done so. We have mentioned what we proposed to do, but we have not mentioned what were beyond our powers.

1656. It might be of advantage, if you have a certain policy to carry out, to state it in public, so as to get the support of public opinion in favour of what you think ought to be done?—I quite agree.

1657. But you have not taken advantage of your annual report to do that?—We ought to have done so, I quite admit. I think we ought to have done so.

1658. You mentioned, I think, in agreement with the chairman, and in agreement with other people, that it is quite certain that vessels are now going to Antwerp that used to go to London, on account of the deficiencies of the Port of London?—No, I do not think I said that. I did not mean to say so. I understood the Chairman to say that vessels could go into Antwerp that could not come to London, but I did not know that any facts existed showing that they did do so.

1659. (*Chairman.*) I think I asked you whether you were aware that vessels go to Antwerp now that used to come to London?—I did not understand it in that way. I understood you to ask whether they could go. I cannot tell you one way or the other.

1660. (*Sir Robert Giffen.*) I did not mean to question the statement, but I thought it material for the purposes of this Commission that we should have particulars of that, if possible?—I am afraid it is only a general statement. I will try to get you particulars. We can easily write to the various places and ask for particulars and let you have them.

1661. With regard to the question of dredging, you said that the surplus which has been derived from income during the last few years has been applied to general purposes. If you will turn to the statement of the secretary of the conservancy in answer to Question 59, I think it will appear from that statement that the amount spent from capital upon dredging in the whole of the six years from January, 1894, to December, 1899, is no more than £17,000, so that it was not an important addition to the amount spent on dredging out of income?—The amount spent from capital has been £36,133, and from the reserve income £40,963; total, £77,096.

1662. That is on dredging?—From capital expenditure on various things.

1662A. But I want it on dredging?

1663. (*Chairman.*) Dredging pure and simple—not steam-hoppers?—I have only got dredging for the six years. What we spent during the six years was £123,837 from income, and £14,500 from capital; making £138,387.

1664. (*Sir Robert Giffen.*) That is the total expenditure?—That is the total expenditure.

1665. But I am asking now about the expenditure on dredging?—That is on dredging—on dredging alone.

1666. But the cost of dredging according to your tables, below London Bridge in the six years was £77,000 out of income?—No; that is out of revenue—£77,647, or 27·7 per cent.

1667. And the expenditure out of capital in the same period on dredging is £17,392?—For the same

period the expenditure was £14,500. Then out of reserve income £32,868.

1668. This is on dredging?—All this is dredging.

1668A. Where does it appear in your accounts?

1669. (*Chairman.*) As I understand, the £32,868 is not on dredging, but on new steam hoppers?—The new steam hoppers are used for nothing but dredging.

1670. But we want to separate the cost of the dredging from the purchase of steam hoppers, or new steamers, or anything of that kind?—We found that if we put the dredging out it would cost so much, whereas if we did our own dredging, it would cost so much. We found that it would be much less if we did our own dredging.

1671. I understand that, but what we want to know is how much was spent in plant, and how much in actual dredging. We do not care how much you have spent on plant; we do not care about that for our present purposes; we want to know what you actually spent in dredging the river. Will you look at the answer to question 59?—I did not know you wanted these particulars. Of course I cannot speak on accounts at a moment's notice. I will get up anything you wish to know.

1672. (*Sir Robert Giffen.*) We merely wish to have what is the actual expenditure on dredging, not on ships?—You mean the actual expenditure on dredging below London Bridge?

1673. (*Chairman.*) Other than that spent on plant or hoppers, or anything of that kind?—For the three years, or for the six years?

1674. Since 1896?—I will get that out and send it to the Secretary.

1675. (*Rear-Admiral Hext.*) You stated that, "Until the depth of water over the sills of all the docks is very much increased there would be no practical advantage in forming such a channel"?—Yes.

1676. Are we to understand that you consider that the sills of the docks should regulate the depth of the river?—No. It is no good our giving the river such a depth that it could not be used because the sills of the docks are so high. In answer to Mr. Ellis, I said that we were quite prepared to lower the river if we had the funds, and then let Parliament call on the docks to lengthen their sills; but it is no good having the river deepened—no practical good—if we have got to bring vessels up to lie outside the docks blocking the navigation till they can get in. They can all get in now at any state of the tide except eight vessels, as I understand.

1677. (*Chairman.*) Not at any state of the tide?—No, not quite.

1678. You furnished us the particulars of that?—Just so.

1679. (*Rear-Admiral Hext.*) With reference to that matter you think that actually no more water is required than there is over the sills of the docks?—No, I do not go so far as that. My opinion is—if I was asked—I should like to see greater facilities all the way down the river, and they are gradually growing. We should be able to make deep berths where the ships could go in without waiting for the tides.

1680. Of course, you cannot time the ship's movements so as absolutely to avoid detentions?—No, but we say they should be able to use the river by having their dock sills lowered in such a way that they could always go in.

1681. You have not taken into account their detentions, or the possibility of the ship having to stop there?—The engineer has prepared a statement as to the detentions, and he has also prepared a diagram on purpose to show you exactly what the detentions have been, and he is also going to explain how the sills work.

1681A. Does he refer in that statement to detention by fog, when a ship is once in the channel?—No, only with regard to water.

Recalled 5566.

*Mr. C. J.  
More.*

Mr. CHARLES JAMES MORE recalled and further examined.

1682. (*Chairman.*) You have some papers to put in, Mr. More?—Yes. The first is in reply to questions 329-332.

1683. (*Mr. Ellis.*) That is relative to paragraph 25 of the Report of the Barry Commission?—Yes, it is a statement as to the delay to ships arriving off Southend at low water. (*See Appendix, 5th day, No. 1.*) Then

the second paper is in reply to Question 361 by Sir John Hext. There I promised to give a list of the dredging plant and the ages of the dredgers. That I hand in. (*See Appendix, 5th day, No. 2.*) Then on behalf of the Secretary of the Conservators perhaps I might be allowed to hand in the following statements: The first is: "An account for the years 1894 to 1899 in-

clusive, of the amount received by the Conservators for rents on accommodations and for sales of foreshore for the purpose of accommodations, and an account of the moneys paid to Her Majesty's Commissioners of Woods on behalf of the Crown"; that was referred to in Questions 38-40. (See Appendix, 5th day, No. 3). Then the second is: "An account of the receipts and expenditure of the Thames Conservancy for the years 1894-99 inclusive (a) below London Bridge; (b) London Bridge to Staines; (c) Summary." That was asked for at Question 51. (See Appendix, 5th day, No. 4.) Then the third is "A return of attendances at board and committee meetings of the Conservators of the River Thames for the year 1899, and to the 31st October, 1900." That was asked for at Questions 68 and 150. (See Appendix 5th day, No. 5.) Then the fourth is: "A statement showing the number of licences granted by the Thames Conservancy for all accommodations below Teddington for the years 1895-99 inclusive." That was asked for at Questions 199 and 201. (See Appendix, 5th day, No. 6.)

1684. (Chairman.) Those are the licences the price of which is governed by an arbitrator?—Under the Act an assessor has to be appointed by the Conservators.

1685. That has already been described?—That is so. They all have to be assessed.

1686. The price is fixed by an assessor?—The price is fixed by an assessor independent entirely of the Conservators. Then the fifth table is: "An account of the receipts and expenditure of the Thames Conservancy for the years 1894 to 1899 inclusive; (a) Below Teddington Lock; (b) From Teddington Lock to Staines; and (c) Summary. (See Appendix, 5th day, No. 7.)

1687. I see in Appendix No. 4, of the first day, it is stated: "In my opinion there is space in Barking Reach, Erith Reach, Erith Sands, Long Reach, St. Clement's Reach, and Northfleet Hope, where additional moorings might be laid down by ships without detriment to the navigation"?—That has been shown on a chart which has already been handed in.

1688. Will you just explain that chart?—These dark marks show the existing tiers where vessels may be unloaded into barges.

1689. Where are the new mooring places that you speak of?—These portions coloured black show the existing ones; the spaces coloured red are the proposed new mooring spaces.

1689a. (Sir John Wolfe-Barry.) They are a long way down the river?—Yes. The river is pretty well crowded near London; you could hardly put more.

1690. (Chairman.) Have you had any applications for any of those lower river spaces?—No; it is suggested that these should be public moorings, so that if necessary, ships of deep draught might go and be unloaded into barges direct.

1691. Have you made any estimate as to the cost of dredging these mooring places. You say, "With dredging or with very little dredging." Have you had any estimate of the cost?—No, no estimate has been made of the cost of this work.

1692. We should like to know what you estimate would be the cost of providing these extra moorings to supplement this Appendix No. 4?—I will get that out for you.

1693. Have you anything further to put in?—There is the table referred to by Sir Frederick Dixon-Hartland, showing the level of the sills of all the London docks. I will now hand it in. (See Appendix, 5th day No. 8.) It shows the level of low water on the Admiralty Charts, and from that you get the depth of water on the sill at low water. The last column shows the depth of water in the channel which is proposed to be made by the Conservators.

1694. The last proposal?—The last proposal, that is to say the one I put in in my evidence.

1695. Is there anything else you have to give us?—That is all.

1696. (Sir John Wolfe-Barry.) May I ask one question on the table shown in Appendix 4, showing the dredging under the head of "Expenditure" for the years 1894, 1895, 1896, 1897, 1898, and 1899. Can you tell why the expenditure rose from £12,302 in 1898 to £24,037 in 1899?—Yes. That was on account of new hoppers which we purchased to carry out the recommendations of the Commission, and to carry the

dredgings down to Barrow Deep instead of putting them into the channel. Mr. C. J. Moss.

1697. That includes therefore the cost of plant?—No, that does not include the cost of plant. 20 Nov. 1900.

1698. Hoppers surely are plant, are they not?—Yes, but that was the working of the dredgers—the working merely.

1699. Then why does it rise from £12,302 in 1898 to £24,037 in 1899?—Because of the extra expense of working these very large hoppers.

1700. Then you have been doing very much more work?—Yes, and of course we have had to carry the stuff so far away.

1701. (Chairman.) Under what head comes the expense of providing for these extra dredgers or hoppers? Can you state whether you have charged to capital all the expense of these dredgers and hoppers, and whether this is dredging pure and simple in the tables you have given us?—I have put in the dredging statement in my own evidence, and I can explain from that that the total dredging for the years 1894 to 1899 was £138,000, out of which about £30,000 was charged to capital for these new hoppers and the alterations to the dredgers.

1702. (Sir John Wolfe-Barry.) Then the great increase of the cost between 1898 and 1899 is due to working the larger plant, and taking the material further out to sea. is not that so?—That is so.

1703. Possibly you could give us at some future time an account of the quantity dredged for these same years 1894 to 1899, so that we could compare it with the cost?—Certainly. See 5464.

1704. Have you any record of what is removed by private dredging?—No, we have no record.

1705. That I rather fancy has been getting a smaller quantity?—Trinity House do not do any dredging now.

1706. I was referring to private dredging?—Yes, I think they take a large quantity still. There are four or five of these private dredgers in the lower reaches.

1707. You have no record?—We have no record of what they take.

1708. Therefore we should not be right in assuming that what the Thames Conservancy dredge is the total quantity dredged out of the river?—No, they dredge a very considerable quantity, the only difference being that we dredge systematically in the channel, whereas these dredgers go where they get the good stuff.

1709. Where they get gravel?—Where they get gravel.

1710. (Rear-Admiral Hext.) Was any regular continuous survey of the river undertaken before the recommendations of the Commission of 1896?—The Conservators' surveyor regularly surveyed the river nearly down to Gravesend, but there was no survey beyond that. That was done by the Admiralty.

1711. Was there any regular continuous survey going on constantly before the date of the recommendation of the Commission of 1896?—Only so far down as about Northfleet, not beyond that.

1712. With reference to paragraph 39 of the Report of that Commission of 1896, who was responsible for that spoil being deposited in Dead Man's Hole?—The engineer to the Board at that time recommended this place as being suitable for deposit, because it was so very deep and convenient to get to.

1713. It is stated that this deposit of spoil commenced in 1878. Was any survey made to see if the deposit of 2,000,000 cubic yards in a space of 200,000 square yards in any way altered the bed of the river at this place?—They occasionally surveyed the hole itself up and down, but not across the whole river. Surveys were made actually where the deposit took place.

1714. Then I presume that that survey showed that there was no filling up of the place?—There was filling up—not so much as you would expect from the quantity put in, but there was decided filling up.

1715. You say there were surveys taken?—Oh, yes, on that part—local surveys.

1716. In that case did the bottom of this Dead Man's Hole show any decided decrease of depth?—Yes, it did in parts.

1717. It did?—Yes.

1718. How can you reconcile that with the Report of the Commission of 1896, that it did not?—In parts it

Mr. C. J.  
More.  
20 Nov. 1900.

did not, but certainly at one end it was distinctly shallow. Our surveys showed that. It may not have been shown on the Admiralty Chart, because the Admiralty very rarely surveyed. That was the question of course that was brought before the Commission.

1719. Then it must have been an error, because the report of the Commission distinctly says that it did not show a decrease of depth?—Undoubtedly the Commission were perfectly right in stating that the whole ought to have been filled up with the quantity that was put in. It did not all stop there. That is quite certain.

1720. In paragraph 40 they say: "The recent surveys, however, show that while other portions of the river have become shallower, the depth of Dead Man's Hole has not been reduced?"—It is very easy to see by referring to the charts. If you will allow me to look into our large charts I will go into the matter; I cannot do it off-hand.

1721. Presuming that paragraph 40, where it states that the depth of Dead Man's Hole had not been reduced, is accurate, it follows that the neglect of the obvious course of constantly surveying it led to the detriment of the lower channel?—I do not know that it did. I do not think the surveys prove that in any particular part—

1722. Take the report of this Committee, and read paragraph 40?—Yes, I see the paragraph. The Commission state evidently that they considered that it was injurious to the river to put the stuff there. That is undoubtedly so.

1723. Anyhow it appears to be clearly proved that the Conservators deposited 2,000,000 cubic yards in a space of 200,000 square yards, and took no steps to constantly survey to see that the place was filled up?—Oh, yes. We surveyed the place itself. The hole was surveyed.

1724. How often in that time?—About once a year or something of that kind.

1725. Then in spite of being surveyed once a year, and finding that there was no great decrease, they still went on depositing there?—Yes.

1726. With reference to Sir Frederick Dixon-Hartland's evidence, he stated that there is no question of divided authority between the Trinity House and the

Thames Conservancy. Do the Trinity House buoy the channels within the Thames Conservancy jurisdiction without reference to the Conservancy?—Yes.

1727. Without reference to the Conservancy?—Without any reference whatever. They put them wherever they think fit.

1728. Do the Conservancy send plans of their dredging operations officially to the Trinity House Board?—Yes, I believe we do.

1729. (Chairman.) There is a member of Trinity House on the Board?—We have two members.

1730. (Rear-Admiral Hext.) The Yantlet Channel having been deepened, did the Conservancy ask the Trinity House to buoy it?—The question was raised at the Board, but I do not know whether an official letter was written or not. It was very much talked about at the Board, I know.

1731. You cannot answer that question?—I cannot answer definitely whether they wrote or not. I am told it was not brought on officially.

1732. My question is this. The Yantlet Channel having been deepened, did the Conservancy ask the Trinity House to buoy it?—Not officially.

1733. Did the Trinity House buoy it?—No, they did not.

1734. Did the Trinity House tell the Conservancy why they did not propose to buoy it?—Not officially. I know the reasons, but they were not stated officially.

1735. Then your answers to those questions appear to show that there is a dual control. Sir Frederick Dixon-Hartland said: "There is no question of divided authority." I want to arrive at the fact as to that?—There is a distinct authority undoubtedly, because the Trinity House buoy the channel irrespective of anything the Conservancy may say. I may say that at one time the Conservancy had the buoys under their control, but Parliament took away the control.

1736. Then, so far as buoys are concerned, there is a divided authority?—There is a divided authority undoubtedly.

Recalled 54.

Mr. WILLIAM FORREST MALCOLM called and examined.

Mr. W. F.  
Malcolm.

1737. (Chairman.) You are Chairman of the Surrey Commercial Dock Company?—Yes.

1738. Since when?—Since March of the present year. I may mention that we change our Chairman annually, the Chairman, before being elected, having to serve one or two years previously as Deputy Chairman.

1739. Will you give us your evidence as to the origin and growth of the docks of the Company?—The docks of the Surrey Commercial Dock Company are situated upon a peninsula on the south side of the River Thames, between the Lower Pool and Limehouse Reach, of which they occupy the greater part. Some interest attaches to the fact that a Dock constructed on this site appears to have been the first public wet dock in the United Kingdom. This dock was known as the "Howland Great Wet Dock," and was so named after a family settled at Streatham, to whom the property belonged. In 1695 Elizabeth Howland, daughter and heiress of Sir Giles Howland, married Wriothesley, the Marquis of Tavistock, the son of the celebrated Lord William Russell, and the Howland property passed to the Russells by marriage settlement, and remained in their possession until 1763. The minutes of the House of Lords show that a petition of William, Duke of Bedford, Lady Rachael Russell, and Elizabeth Howland, on behalf of the Marquis of Tavistock, and the Marchioness, his wife, minors, was presented to the House on the 11th February, 1695, setting forth that a sum of money had been laid out for the making of a dry dock at Reddiffe (Rotherhithe), and that the petitioners were well advised that the making of a wet dock there will not only be a great improvement of the said minor's estate, but of use to the public, and praying leave to bring in a Bill to enable them to raise and lay out monies for making a wet dock at Reddiffe. Leave was given to bring in the Bill, which was read for the first time on Sunday the 15th February, 1695, and received the Royal Assent on the 10th April, 1696. The wet dock referred to

was constructed shortly after the Bill received the Royal Assent, as is evidenced by an old drawing of the Howland Dock, in the possession of the company with the description of the dock in manuscript appended, from which the following is an extract:—"This dock hath been found a very safe repository for ships, which was fully proved in that terrible and violent storm which happened on the 27th November, 1703, when, by the extremity of the winds, all the ships in the river which rode either at chains or their own moorings were forced adrift, and confusedly driven on the north shore, where some were lost, and most received great damage. Then, of all the several ships deposited in this wet dock, there was only one slightly injured in her bowsprit." The dock was sold by the Russell family in 1763. It was subsequently laid out for the accommodation of the vessels engaged in the Greenland whale fishery, and was then called the "Greenland Dock." In 1806 the dock became the property of a Mr. W. Ritchie. In the course of time, owing to the decline in the whaling trade and the simultaneous increase in the trade with the North of Europe, a change took place in the character of the business, and from that time the dock was mainly used by vessels laden with timber, deals, grain, and other merchandise from northern European ports. In 1807 the Commercial Dock Company was inaugurated, having for its object the purchase of the Greenland Dock and the adjacent property. The company commenced the work of extension and improvement by deepening and lengthening the existing entrance to the Commercial Docks, and the foundation of the new entrance was laid in November, 1808. In 1809 Mr. John Moore and others formed a project under the style of the Baltic Dock Company, for converting an estate of about 45 acres at Rotherhithe into ponds for the storing and bonding of timber, with an entrance to the Thames to the north of Barnard's Yard. This scheme received the assent of his Majesty's Treasury, who granted the promoters a preference in the bonding of timber, in consideration

See 1384

of the large capital which would be necessarily expended in forming, constructing, and keeping up the dock and ponds. In July, 1809, the Commercial Dock Company acquired the estate and bonding privileges of the Baltic Dock Company. In 1810 the Commercial Dock Company obtained an Act of Parliament (50 George III., c. 207) for maintaining and improving the docks and warehouses called the Commercial Docks, and for making and maintaining other docks and warehouses to communicate therewith in the Parish of Saint Mary, Rotherhithe. In the following year, 1811, a further Act (51 George III., c. 66) was obtained to amend and render more effectual the previous Act, and for extending the powers of the Act. This was followed in 1817 by an Act (57 George III., c. 62) amending the two previous Acts and conferring further powers upon the company. Some time after the formation of the Commercial Dock Company another dock had been established at Rotherhithe, styled the East Country Dock, comprising premises adjacent to the Commercial Dock. The Acts relating to this undertaking are the 51 George III., c. 171, and the 6 George IV., c. 64. In 1860 the East Country Dock was purchased by the Commercial Dock Company, and in 1851 an Act (14 and 15 Victoria c. 43) was obtained, confirming the purchase, and empowering the company to construct a new entrance to the Thames, now known as the South Lock, and to enlarge the East Country Dock. The works were carried out, and the new dock and premises were opened on the 13th August, 1855. In 1860 a further Act was obtained (23 Victoria, c. 39), extending the time granted by the Act of 1851 in respect of the construction of the new entrance from the Thames at the Lavender Dock and other works. This entrance was completed and opened in September, 1862. The Surrey Canal Company was incorporated in 1801 by the Act of 41 George III., c. 31, under the style of the Company of Proprietors of the Grand Surrey Canal. This Act empowered the company to make and maintain a navigable canal from the River Thames at a place called Wilkinson's Gun Wharf, in the Parish of Saint Mary, Rotherhithe, to the town of Mitcham, in the County of Surrey, and also divers collateral cuts or branches communicating from the same to certain parishes and places within the Counties of Surrey and Kent. In 1803 it was decided to construct an entrance basin and ship lock into the river, the ship lock to be 140ft. in length. This lock and basin were completed and opened for the reception of shipping and craft on the 13th March, 1807. In 1807 an Act (47 George III., c. 80) was passed to enable the company to complete the works and to raise further monies for this purpose. In 1808 a further Act (48 George III., c. 99) was obtained authorising the company to supply with water the several towns, districts, and places therein mentioned, and to amend the several Acts relating to the said canal. The canal having been completed to the basin to Camberwell road, a distance of about four miles, application was made to Parliament, and in 1811 an Act was obtained (51 George III., c. 170), enabling the company to make and maintain a collateral cut from the canal at a place nearly opposite certain docks called the Commercial Docks, communicating with the basin at the lower end near the Thames, to complete the works, and to raise further capital for these purposes. In 1855 an Act was passed (18 & 19 Victoria, c. 134), consolidating the previous Acts, and changing the corporate name of the undertaking to that of the Grand Surrey Docks and Canal Company. Powers were also given under this Act for the making of a new entrance from the Thames, additional docks and other works, and the raising of further capital. These new works, comprising a deep-water dock of 16 acres, a basin of 3 acres, and a lock 250ft. in length by 50ft. in width with a depth of water on the sill of 27ft. below Trinity standard, which had been commenced in 1858, were completed and opened on the 6th July, 1860. In the same year, 1860, a further Act (23 Victoria c. 74), was passed authorising the company to make additional docks and other works, to raise further moneys, and for other purposes. A few years after the passing of the above mentioned Act the Commercial Dock Company and the Grand Surrey Docks and Canal Company came to the conclusion that their joint interests and the interests of the trade of the port would be promoted by an amalgamation of the companies, and in 1864 it was decided to apply to Parliament for powers to amalgamate the undertakings. The Surrey Commercial Dock Act

(27 Victoria, c. 31), which incorporated the two companies under the name of the Surrey Commercial Dock Company, and consolidated their previous Acts, was passed in the Session of 1864. Powers were given under this Act, *inter alia*, to increase the capital of the company, to acquire additional lands, and to execute various new works, including a communication ship lock between the Lavender Pond of the Commercial Dock and the Stave Dock of the Surrey Docks. I will hand in a schedule of the several Acts of Parliament relating to the Grand Surrey Dock and Canal Company, the Commercial Dock Company, and the Surrey Commercial Dock Company.

(The Witness handed in schedule. See Appendix 5th day, No. 9.)

The Surrey Commercial Docks occupy a somewhat exceptional position with regard to the trade of the Port of London. Reference has been made to the decline in the Greenland trade and the simultaneous expansion of the trade in timber and corn with the Baltic ports which took place in the early part of the present century, when the Commercial Docks became the principal resort of the vessels engaged in this trade. From that time to the present these docks have held their position as a centre for the trade in timber, wood goods and grain, and their situation within a distance, by road, of two miles from London Bridge, and  $1\frac{1}{2}$  miles from the Tower Bridge, affords exceptional facilities for the cartage of goods direct from the docks. I will now hand in some tables which give the figures relating to the principal features of the company's business.

The Witness handed in the following tables:—

(A statement of the accommodation afforded by the Surrey Commercial Docks, giving particulars of the docks, locks, timber ponds, warehouses, sheds, etc. See Appendix, 5th day, No. 10.)

(A table showing the tonnage of vessels of various classes (excluding light vessels) received into the Surrey Commercial Docks from 1865 to 1890. See Appendix, 5th day, No. 11.)

(A table showing the tonnage of vessels of various classes (excluding light vessels) received into the Surrey Commercial Docks from 1881 to 1899. See Appendix, 5th day, No. 12.)

(A table showing the number and tonnage of vessels wood-laden entering the port of London and the Surrey Commercial Docks from 1890 to 1899 (exclusive of vessels from the East and West Indies), showing the proportion of the wood tonnage entering the Surrey Commercial Docks. See Appendix, 5th day, No. 13.)

(A table showing the percentage of sawn wood goods landed in Surrey Commercial Docks to total import into London. See Appendix, 5th day, No. 14.)

(A table showing the quantities of sawn wood goods delivered direct from ship to craft from 1890 to 1899, and the percentage of these quantities to the total quantity of these goods received into the Surrey Commercial Docks. See Appendix, 5th day, No. 15.)

(A table showing the number and tonnage of sailing vessels and steamers wood-laden that entered the Surrey Commercial Docks from 1870 to 1899, showing the increase in the number and tonnage of steamers during those years. See Appendix, 5th day, No. 16.)

(A table showing the number and tonnage of sailing vessels and steamers grain laden that entered the Surrey Commercial Docks from 1870 to 1899, showing the increase in the number and tonnage of steamers during those years. See Appendix, 5th day, No. 17.)

(A table showing the increase in the tonnage of steamers that entered the Surrey Commercial Docks from 1880 to 1899. See Appendix, 5th day, No. 18.)

The tonnage of vessels of various classes, excluding light vessels, which have entered these docks from 1865 to 1899, is set out in Appendices 11 and 12. From this it will be seen that the total tonnage which in 1865 was 744,540 tons had increased in 1894 to upwards of 1,000,000 tons.

1740. (Sir Robert Giffen.) I suppose that includes coasting vessels as well as vessels in the foreign trade?—Yes, but I might explain that our coasting vessels are a very small proportion. Comparing the tonnage of 1865 with 1899 there has been an increase in the wood tonnage, including firewood, of 46,344 tons; the grain tonnage has increased from 114,735 tons in 1865, to 237,390 tons in 1895. The apparent decline in the grain tonnage since 1895 is attributable to the failure in the crops, and consequent diminished import of Russian grain, of which

Mr. W. F. Malcolm.

Mr. W. F.  
Malcolm.

20 Nov. 1900.

the company receive a large proportion. It is to be observed that owing to the increase of the number and tonnage of steamers employed in the wood and grain trades since 1875, the proportion of goods carried to the register tonnage has considerably increased, the out-turn of steamers being greatly in excess of that of sailing vessels of corresponding tonnage. Appendix 13 shows the percentage of the wood tonnage received into the Surrey Commercial Docks to the tonnage of wood laden vessels into the Port of London, excluding vessels laden with hard wood timber which discharge in the docks of the London and India Docks Joint Committee. Appendix 14 shows the total import into London of sawn wood goods from 1890 to 1899, and the percentage of the quantities landed in the Surrey Commercial Docks to the total import. It will be seen from these figures that the proportion of the goods landed with the company has decreased from 76·6 per cent. in 1890 to 54 per cent. in 1899. This is due to the growing increase in the quantity of the goods delivered overside, that is to say, delivered direct from ship to craft, and conveyed from the docks to the private wood wharves and saw mills, and upon which goods the company are precluded from making any charge. Appendix 15 gives the percentage of the deliveries overside to the goods landed and to the total quantity received into dock from 1890 to 1899. In 1890 the overside deliveries amounted to 49,900 standards, being 23 per cent. of the total quantity landed, or 18·9 per cent. of the total quantity received into dock. In 1899 the overside deliveries had increased to 123,759 standards, being 68 per cent. of the quantity landed, or 18·9 per cent. of the total quantity received into dock. Without attempting to raise the question of the exemption from charges of lighters and craft engaged in this overside business, which it is understood the Commissioners propose to consider hereafter, it may be permissible to state the fact that the number of barges thus employed, in diverting from the docks goods some portion of which might otherwise remain with them, seriously interferes with the conduct of the dock business, especially in the busy season, and that the expenses necessarily incurred in the docking, undocking and handling the numerous craft which frequent the docks impose a serious burden upon the company.

See 1841-2.

1741. (Chairman.) Upon that I assume that whenever we go into the lighter question you will be prepared to offer distinct evidence upon the subject?—Yes, we shall be.

1742. Either by yourself or by some representative of your dock?—Precisely. During the period which has elapsed since the amalgamation of the companies in 1864, there has been not only a considerable increase in the volume of the business, but also material alterations in the nature and conditions of the trade connected with these docks. Foremost among these may be mentioned the introduction and rapid increase in the number and tonnage of steam vessels since 1870. Appendix 16 shows that in 1870 all the wood-laden vessels received into these docks were sailing ships. In 1875 67 wood-laden steamers entered dock with an aggregate of 47,429 tons, averaging 708 tons for each steamer, the proportion of steam tonnage being 9·6 per cent., and sailing tonnage 90·4 per cent. of the whole. In 1899 the number of steamers had increased to 512, with an aggregate of 465,686 tons, averaging 990 tons for each steamer; the steam tonnage being 83·7 per cent., and the sailing tonnage 16·3 per cent. of the total. Appendix 17 shows a similar increase in the number and tonnage of steamers grain-laden. In 1870 no grain-laden steamer entered the docks: in 1875 the steam tonnage was 39·8 per cent., and the sailing tonnage 60·2 per cent. of the total grain tonnage. In 1897 the steam tonnage amounted to 99·9 per cent. of the whole, only one sailing vessel of 100 tons register having entered the dock in that year. Appendix 18 shows the increase in the tonnage of steamers using these docks since 1880. Whilst in that year no vessel entered the docks of more than 1,500 tons register, in 1899 there were 73 vessels exceeding that tonnage, of which 16 were above 2,000 tons register. Then I have to deal with the question of the extension of the dock system and improvements effected by the company since 1864. That the company have been fully alive to the changed conditions and requirements of the trade with which they are concerned, and have persistently endeavoured to meet the demands for additional accommodation and improved facilities is shown by the following summary of the chief additions and improvements which have been carried out since 1864. A comparison of the two plans showing the premises as they were in 1867, and as they are at the present time, will afford some idea of the nature and extent

of the improvements effected. The Dock system has been greatly altered and extended. A new dock known as the Canada Dock, 1,508ft. in length by 454ft. in breadth, with a water area of 15½ acres, was constructed and opened in November, 1876. Four grain warehouses have been erected, having together a storage capacity of 168,000 qrs. The demand for under-cover accommodation for wood goods has been met by the erection of twenty-three blocks of sheds, covering an area of 46 acres, and having a storage capacity of 61,500 standards, or 202,950 loads. I hand in a schedule of the works which have been carried out by the company since 1864, involving a capital expenditure of £484,914.

(The Witness handed in a schedule of the works carried out by the Surrey Commercial Dock Company from 1864 to the end of 1899 charged to capital account, excluding the Dock Extension Works now in course of construction. See Appendix, 5th Day, No. 19.)

This schedule does not include the dock extension works now in progress, which are referred to hereafter. Then the next point is with regard to the dock extension works now in course of construction. The constantly increasing dimensions and tonnage of vessels employed in the trades in which the Surrey Commercial Dock Company is mainly interested had for long engaged the serious attention of the Directors. The necessity of providing dock accommodation which would adequately meet not only the present, but also the probable future, requirements of the shipping using these docks was apparent. It was accordingly decided to construct a new dock on the site of the old Greenland Dock with an entrance lock of such dimensions as would afford ample accommodation for the largest class of vessels that now or in the future would resort to these docks. Application was made to Parliament for power to carry out this scheme. In 1894 an Act (57 & 58 Vict. c. 67.) was passed authorising the company to alter and extend their works, to raise further capital, and for other purposes. The works authorised by this Act comprised:—The extension of the Greenland Dock; the construction of a lock and entrance from the river adjoining the Greenland entrance lock; the construction of a communication passage from the south-eastern corner of the Canada Dock into the new Greenland Dock; the extension of the Russia Dock southward; the construction of a communication passage from the Russia Dock into the Greenland Dock; the construction of new canal locks; the extension from the Greenland Dock into the Surrey Canal, and the formation of a basin by the widening of the canal. The extension works were commenced in 1894, and the first section of the new dock, 845ft. in length by 450ft. in breadth, with a water area of about 8½ acres, was completed in 1897. The second section of these works is now in course of construction. The new dock when completed will be 2,350ft. in length by 450ft. in breadth at the widest part, covering an area of about 21 acres, with an entrance lock from the river 550ft. in length, 80ft. in breadth, and having a depth of water on the sill 33ft. below Trinity high-water standard.

See 1870  
and 1886.

1743. Now you are coming to the question of the capital expenditure.—Yes. These works have entailed a capital expenditure to the present time of about £600,000, and it is estimated that a further expenditure of upwards of £250,000 will be required for the completion of the works and the provision of the necessary equipment. In view of the foregoing statement, and notwithstanding the criticism with which the dock companies of the port have been in some quarters assailed, it may be fairly contended that this company have not been slow to recognise the necessity of adapting their system to modern requirements, and that to the full extent of their powers they have endeavoured to meet the demands for increased accommodation and facilities which have arisen from the altered conditions and development of the trades with which they are concerned. In connection with the dock extension works, it is desired to call the attention of the Royal Commissioners to a matter of the utmost importance to this company, and also to the trade of the port. As already stated, the new entrance lock now in course of construction provides for a depth of water on the sill of 33ft. below Trinity high-water standard. It is obvious that unless the river is of sufficient depth to make it navigable by vessels of deep draught up to the entrance, the efforts of the company to provide accommodation for such vessels will be entirely frustrated. According to the Report of the London County Council on the Port of London the Thames Conservancy contemplated, besides the

See 1843. channel of 30ft. minimum depth to Gravesend, the maintenance of a navigable channel 18ft. deep and 300ft. wide from the Albert Docks to the Millwall Docks. This scheme was to have been carried out within 18 months from January, 1897, but it appears that no attempt has yet been made to deepen or widen the river channel above the Victoria Dock entrance. The proposed channel of 300ft. wide is inadequate. To render the new dock accessible to vessels of the class it is designed to take, it will be necessary that the river should be deepened to not less than 38ft. below Trinity high-water standard outside the new entrance and for a distance of 600ft. above and below it; not only in mid-channel, but extending across the river between the opposite shores as far as may be practicable. In the interest, not only of this company, but of the port, it is imperative that the river should be made navigable for vessels of deep draught above as well as below Gravesend, and it is to be hoped that measures may be adopted to carry out the necessary deepening without delay.

See 1870. 1744. Will you just give us the explanation of that 38ft. What depth of water does it mean at low water?—I should be glad if you would permit me to tender our dock engineer, Mr. Gaskell, to give evidence with regard to that. He can give evidence on that engineering point better than I can. I am not an expert in those matters.

See 1836. 1745. We only want to know what it means. We have been talking about 30ft. at low water. What does that 38ft. mean. We want you to reduce this to the common denominator of either 24ft., or 26ft., or 30ft. Which does it come under?—As I understand the depth at present is 14ft.

1746. The Millwall Dock is about 24ft. What we want to know is whether you want the same. For convenience sake, when we are speaking of these things, it is as well that we should have a common standard for all the docks?—I am told that 38ft. below Trinity high water standard would mean 20ft. below that standard at low water and spring tides.

1747. (Sir John Wolfe-Barry.) You mean 20ft. below low water at spring tides?—20ft. below low water of an ordinary spring tide.

1748. (Chairman.) Can you tell us whether there have been any vessels delayed outside your docks because the river is not deep enough at the present time?—We have had in neap tides vessels that could enter our dock with the present lock, which is not equal to our new lock, delayed sometimes by not being able to come up.

1749. How long are they delayed—half a day?—I should say several days if they happen to come up just when the neap tides are taken off so that they cannot get in. They must wait till the neap tides come to their extreme and wait till the tides come on toward the spring tide.

1750. Can you put in a table of vessels that have been so detained during the last year?—I have not such a table prepared.

1751. Will you kindly give us a table of vessels that have been practically detained from entering the dock in consequence of the want of depth of water in the river?—I have already said there would be much more detention of large vessels that we could take into our new lock than there would be of vessels with our present lock.

1752. At the present time the larger class of vessels which would come up do not come up at all or only come up on very high tides?—Yes. In the wood trade we do receive the largest class of vessels that are loaded with wood, for this reason:—A wood cargo comes for sale to London, and it is unsaleable if it is landed in any other dock than the Surrey Commercial Dock; but it is very probable that vessels for the wood trade would be built of a still larger capacity than they are at present if it were clear to the owners that they could come up the River Thames without detention at any state of the tides, either neap or spring, and could be received into our lock and so into our dock without any detention.

1753. Do you know of any vessels in the wood trade at present which go to other ports in preference to London in consequence of there being a greater depth of water at those ports. Do they go to Hull, for instance?—That I cannot speak to. I can make inquiry and submit the results.

1754. You spoke just now of larger vessels that

would come up if the water was deeper. What I ask you now is whether there are any at present that go to other docks?—I would rather amend my evidence by saying that the tendency with regard to steamers in the wood trade, as in all other trades, is to build them gradually larger. The larger the steamer is, the less are the working expenses proportionately. If steamship owners were aware that steamers of a considerably larger size than those employed at present could come up to London, and go into the Surrey Commercial Docks without delay, there might be a tendency to increase the size of the steamers built for the timber trade.

1755. I think you said that 75 per cent. of the wood that comes into London comes into your docks?—Yes.

1756. (Mr. Ellis.) There seems to be a decrease in percentage?—Yes.

1757. (Chairman.) I want to know whether you have ample storage in your docks for all the timber that comes in, or whether it is conveyed at once to the purchasers in different parts of London, either by land or by water?—We generally have a very large quantity both of floating timber on our ponds and of sawn timber in our sheds, and in the open, which after arriving in London is sold and distributed piecemeal to the buyers.

1758. Is there any other part of the river that would be more suitable for the storage of timber on a large scale than your docks?—I think not; and certainly, if any place was found further down the river that might be suitable for the reception of it, it would be by no means suitable for the distribution. We stand very conveniently for the distribution of timber.

1759. Have you floating barges for the more rapid unloading of timber vessels, or what steps do you take to unload timber vessels as rapidly as possible?—When possible we bring up timber vessels alongside our quays, and discharge them straight away on to the quays, but a certain proportion of our sheds and open spaces for storing wood goods are not accessible to vessels of large tonnage. In the case of those vessels we employ, first, barges belonging to ourselves, and when they are exhausted we hire barges and take away the sawn timber from the vessels to the sheds or quays where the depth of water would not permit the vessels to discharge, but where we land them.

1760. In Manchester we found they had floating quays upon which timber could be landed, and then the ship would clear its cargo, and the floating quays could be transferred to any portion of the dock and landed as required. You have not tried them have you?—We have had the matter under consideration, but we have not seen our way to try it in the meantime.

1761. You have not room for it, I suppose?—There would be a difficulty, but we have had the idea under consideration whether it might not be a facility to attempt it provisionally to a certain extent.

1762. I presume the great thing in the present day is to unload vessels as rapidly as possible?—Certainly.

1763. Have you any special machinery for the unloading of timber vessels?—As a rule steamers discharge themselves with their own power. I may say with regard to the quickness of dispatch that one of our great grievances is that when goods go away overside, in the case of a vessel which, if brought alongside our quay with an entire cargo to be landed at our docks, could be discharged in three days, perhaps half that cargo has to go away overside, and not only do we get nothing for it, but through the delay caused by picking out the cargo which has to be discharged into the barges a steamer may be detained six days instead of three, at a loss to the steamer herself and at a great loss to us by blocking up the quay space which, at certain times in the season, is very valuable.

1764. Are you in favour of an alteration in the practice of the port so that everything should be landed on to the quays at once and distributed either by land or by water?—I cannot say that in all branches of our trade that would be practicable. In the case of our floating timber we discharge it direct into the water, and there it remains. What we plead for is to be allowed some compensation in the shape of a tax upon the barges using our docks for their own benefit and not for ours, and on the goods which are taken away loaded in the barges from the ship's side, for which at present we receive no remuneration.

1765. Do you not draw any distinction between the barges themselves and the goods which they contain?—Our opinion is that one could scarcely tax the barge itself to a sufficient extent to compensate us; that there ought

Mr. W. &  
Malcolm.

20 Nov. 1900.

See  
1867-70,  
1748.

See 1866,  
1758.

- Mr. W. F. Malcolm.*  
20 Nov. 1900. to be, besides a certain tax upon the barge, a tax upon the goods which have used our docks during their discharge and were loaded into the barge and taken away, and upon which goods we had received no payment of any kind.
- See 7578. 1766. Do you think that that tax upon goods should be applicable to the whole port, or only to the docks?—I do not quite follow you.
- See 1261. 1767. The Chamber of Commerce have stated in evidence that they would not object to certain dues being levied upon the whole port, but they object to dues levied only upon goods in docks. I want to know your opinion?—If dues were charged upon goods discharged in the river, it would not affect us in any way; and therefore we have no opinion on the matter.
1768. Supposing it were charged on the goods in your docks equally with goods in the river, would that satisfy you?—I am not quite sure that I catch your meaning.
1769. I only wish to know whether you have any definite views upon that question. We are quite willing that these views should be stated before us when we come to them, and of course anything that is stated then will be subject for cross-examination. I will not pursue the question further if you do not wish to give any evidence now.—Our object in the matter is almost entirely that we should be paid for the use of our docks by barges and goods coming into the docks, from which we derive no revenue of any kind.
- See 1740. 1770. (*Sir Robert Giffen.*) I asked you a little time ago whether the figures of tonnage in Appendices 11 and 12 included coasting vessels or not, and you replied that the proportion of coasting vessels would be very small, but they were included. Can you tell us what the proportion would be?—I have a table drawn out here which shows the proportion of laden and the proportion of light vessels received into our docks from 1865 up to the present time. Laden vessels are practically, in our docks, exclusively foreign vessels. Light vessels are coasters, which go in to load cargoes of timber and grain. In last year, 1899, the tonnage of laden vessels was 907,347, and the tonnage of light vessels was 47,867; thus bringing the total to 955,214 tons.
1771. Then if we had a figure from the Customs showing that the tonnage of vessels in the foreign trade received into the Commercial Dock was not the figure you mention, but 774,000 tons, I suppose you would say there is some discrepancy that you could not very well explain?—The figure which I am mentioning is the figure for vessels loaded with cargoes of all descriptions—the 907,347.
1772. But you say that they are practically vessels in the foreign trade?—Excepting the 47,867.
1773. Then I am pointing out to you that we have a different figure from that which you have given us supplied by the Customs, and I wish to inquire whether you can suggest any explanation of the discrepancy?—I cannot suggest any explanation, but I think our figures must be the correct ones. We have charged the dues upon the vessels.
- See App. 3rd day No. 3. 1774. Then may I ask whether 112,000 tons coal laden vessels, that you include, come from foreign countries?—No. I should have excepted the coal laden vessels. That is a particular part of our business for the South Metropolitan Gas Company. They would not be taken notice of by the Customs at all.
1775. Then that does alter the figure as to vessels in the foreign trade being substantially what you give here?—I have made a mistake in that in forgetting to take into account that particular branch of our business.
1776. Are any of the other vessels to be dealt with in the same way?—No, I think not.
1777. None of the grain vessels?—No. Coastwise grain would not come to our docks once in a thousand times. We send a good deal of grain away coastwise, but it would be an exceptional thing to receive a cargo coastwise.
1778. Now I should like to ask you a few questions upon Appendices 13 and 14. In Appendix 13 you show that the percentage of all the wood laden vessels coming into the docks is 75 per cent.?—That we receive into our docks 75 per cent.
1779. Of course that is a diminishing percentage, because in 1880 the percentage was 83 per cent.?—Yes.
- See 17634. 1780. Then in the following Appendix 14 you show that the percentage of sawn wood goods landed in your dock compared with the total import into London is now about 54 per cent., which is a smaller percentage than the 75 per cent. in the previous Appendix?—If you will remark, Appendix 13 represents the tonnage of the wood laden vessels received into our docks; Appendix 14 represents the percentage of sawn wood goods landed into our docks.
1781. So you may receive more goods into the dock than are landed?—That is practically our complaint, namely, that a very large quantity coming into our docks are taken away by barges, and are discharged at private wharves, upon which goods and barges we receive no payment.
1782. I just wished to have the explanation of what seemed to be an apparent discrepancy in these figures. Can you give us an idea, with reference to the wood laden vessels, of the weight of the goods as compared with the tonnage of the ships? Would it be much greater?—I had a table made out by our superintendent, in which he takes 12 representative steamers, and 12 representative sailing vessels. In wood we do not count by tonnage; we count so many standards of 165 cubic feet. We find that in 8,262 tons of sailing vessels we have an out-turn of 3,421 standards; 15,855 registered tons of steamers give us an out-turn of 8,926 standards. In round numbers, 1,000 tons register of steamers carries 563 standards, while 1,000 tons register of sailers carries only 414 standards.
1783. Your company have supplied to the Commission a copy of the annual account for last year. I should like to ask you one or two questions on that account. I will ask you just to enumerate the particulars composing your capital—at the present time—how much Ordinary stock, how much Preference Stock, and how much Debentures?—At the present time we have issued stock, Ordinary £1,353,814; Preference £633,290. Of that Preference Stock £131,290 was issued during the present year.
1784. And it is not shown in this account before me?—No, it is not shown in that account. Of Debenture Stock we have issued £140,000, and we have in hand unissued £208,000, which exhausts our Parliamentary powers.
1785. And the total amount issued is—what?—The total capital issued is £1,995,814.
1786. That was at the end of last year, and not including the Preference Stock which you have issued during the present year?—The Preference Stock which we have issued during the present year brings it up to £2,127,104.
1787. Then on the other side what is your total capital expenditure?—The total capital expenditure is £2,243,109 18s.
1788. Something has been added to that during the course of the present year?—Undoubtedly.
1789. Can you tell us the market value of the different stocks at the present time. I want to know the aggregate amount?—Our Ordinary Stock is quoted at £130 to £133; our various Preference Stocks range from £130 to £143; and our Debenture Stock £140 to £145.
1790. And the total market value?—I have not that figure, but if we add one-third in rough figures to the capital it will show what the market value will be.
1791. The market value is one-third more?—Yes, it is a little more than one-third more. It is about 35 per cent. more.
1792. Before I leave this question of capital I assume we may infer from the figures in the account, that to some extent your outlay has been provided out of the balance of cash in your possession, and the large sum to the credit of profit and loss?—The greater part of our stock since the very early days has been placed at a premium. That premium we credited to profit and loss account. We showed the stock only for its nominal amount, not for the amount received for it.
1793. So that a large part of the £375,690 to the credit of profit and loss consists of premiums which have been received in that way?—Yes, a considerable part consists of premiums.
1794. Then, turning to the revenue account, I notice that you divide your dock earnings into three heads; wood department, warehouse department, and dockage?—Yes.
1795. I should like to ask whether it would be possible for you to make some sort of arrangement—as that which the Joint Committee have made, and give us the earnings of the company in the same form?—I think you will

find we state the earnings in the same form on the credit side. We divide it into wood department, warehouse department, and dockage.

1796. Their division is import rates, export rates, and tonnage dues?—Our export rates are practically nil in our docks.

1797. Then what is the division?—Our division is wood department, warehouse department—which is chiefly grain—and dockage.

1798. And the dockage correspondends to the tonnage dues in the accounts of the Joint Committee?—Yes.

1799. Your total income from all sources is £341,000?—Yes.

1800. And your total expenditure is £240,000?—Yes.

1801. That leaves a surplus of rather more than £100,000?—Precisely.

1802. And has that profitable state of affairs been going on for a long time?—We have always been able to pay a fair, reasonable dividend to our shareholders.

1803. What do you call a reasonable dividend?—We have paid for many years past 6 per cent., but I may state that a considerable proportion of that 6 per cent. does not arise from our dock property; it arises from the earnings upon the canal, and upon properties belonging to the dock company.

1804. Your canal earnings are down here at £14,765?—Yes; you will find them stated as £14,765.

1805. And the expenses?—The canal expenses are £2,801.

1806. So that would leave to go to profit and loss about £12,000?—Yes; and also then there are rents of properties £8,667.

1807. So that £20,000 of that £100,000 is partly from the canal and partly from rents of properties?—Yes, which on the whole is more than 1 per cent. upon our ordinary stock.

1808. Have you any outlay in connection with the management of the property?—It would be very small, so small as not to be worth stating separately.

1809. (Mr. Ellis.) I want to ask you a question upon Appendix 17. In column 3 I notice there seems to have been a kind of recovery in sailing ships in the year 1899. Is that merely transient, or is it likely to be permanent?—It is transient. We may get occasionally a few of the large sailing vessels from California, or from the River Plate, sent into our docks, but we do not expect them as a rule.

1810. Then with regard to the tonnage of steamers, there seems to be a very great diminution?—Yes. I can explain that.

1811. Of course, these are grain vessels?—Yes.

1812. Is that diminution likely to go on?—No; we have begun already to recover very rapidly. The grain that we receive is very largely Russian grain, and especially Russian oats, and it so happens that for two years there had been very bad oat crops in Russia, and the price of Russian oats went up very considerably higher than American oats.

1813. Then you expect to get it back again, do you?—We expect to get it back again to the scale of former years.

1814. Then with regard to finance: roughly speaking, out of every pound of income you pay away about 6s. or 6s. 8d. in dividend—about 30 per cent.?—Yes; but our income is very largely derived from very valuable fixed properties that we have. If that property had not been turned into docks at all, but had been left as it was we might have received a better income from ground rents or houses than we are now receiving upon the docks. The fact is, all profits arise in a great degree from the happy circumstance that our predecessors bought property which was at a comparatively very much less value in those days than it is to-day.

1815. Will you kindly translate that into figures. I do not quite follow it in the balance sheet before me. There are £317,000 dock earnings?—Yes, of which a very large percentage is rent.

See 7578. 1816. How much of the £317,000 arises from rent?—Speaking from memory I should say about £80,000.

1817. Then when you use the word "earnings," that includes rent?—Yes.

1818. I do not call it an accurate phrase. "Earn-

ings" is supposed to mean something received for something done?—We give value in the accommodation for the rent which we charge.

1819. You give something, of course. Then you bring a very large balance forward from the 1st January, 1899?—That is represented in the shape of works which we have carried out out of revenue; and also, as I have pointed out, by the premiums upon the issue of our capital.

1820. Then it is not a balance in the ordinary sense of the term—it is fixed property, is it?—A large proportion of it is fixed property; but you will remark that we have a certain amount that we hold in Consols.

1821. Excuse me. Keeping to the Profit and Loss Account, with which I am dealing, you say, "Balance, 1st January, 1899, £369,446"?—Yes.

1822. Is that an ordinary balance in money?—No: it is not in the shape of money.

1823. It could not be divided as dividend then?—No.

1824. It is not a divisible asset?—No.

1825. I only want to get at the facts, you understand?—Certainly.

1826. But taking the account as it stands, you are what I may call a highly prosperous company?—Fairly prosperous—yes.

1827. All your Stocks are at a large premium, at all events?—Yes.

1828. There is no doubt about it, is there?—I am reflecting back on the days when we were more prosperous than we are now.

1829. But you would have no difficulty in raising money if you wanted to?—No.

1830. You would have no difficulty in making extensions or improvements?—We have money provided for our present extensions, and we hope when those are done that we shall be relieved from the necessity of any other works for a considerable time. We have endeavoured to provide for some distance ahead, that is, not to be caught by large vessels coming upon us before we have our locks and other accessories ready to receive them, but to prepare for those vessels to come to them when the time comes.

1831. At all events I may take it from you that you do not come before us like some people *in forma pauperis*?—If we find that there is anything to be done to our dock we hope we shall always be in a position to find money to do it with.

1832. At present you do so?—At present we do.

1833. Now will you go to Appendix 12. Could you at all give me the percentage of vessels of large tonnage that come in that large figure of 907,347 tons that came in in 1899. Could you give me at all an idea of the draught of water of that tonnage?—In Appendix 18 you will find the increase in the tonnage of steamers shown to a certain extent. See 1866.

1834. But I am asking as to draught of water?—I find we have no information as to the draught of water.

1835. And you could not say roughly how much of the 907,347 tons consist of vessels drawing more than 22ft., or 24ft., or anything you like?—I could not give you that information now. We can submit it to you later on, if it is desired. See 1924.

1836. I am rather asking you because of the words you used in your evidence. As I understand you have come here as the chairman of this prosperous company, and you say to us: "In the interest not only of this company, but of the port, it is imperative that the river should be made navigable for vessels of deep draught above as well as below Gravesend," and so on. Do you lay great emphasis on that?—I do lay very considerable emphasis upon it. I have found that vessels which ten years ago we should have treated as beyond the bounds of possibility in any of our trades are to-day vessels that we think nothing of; and I think that very possibly in ten years more we shall find the same state of matters prevailing again, and that the vessels of ten years hence will show an equivalent advance upon the vessels of to-day. See 1743.

1837. And would you wish us to infer that the desirability of deepening the channel of the Thames is growing more urgent year by year?—Distinctly, I think so.

1838. (Sir John Wolfe-Barry.) Is there much dredging that has to be done in the Surrey Commercial Docks?—Yes, we do a very considerable amount of dredging.

Mr. W. F. Malcolm.

20 Nov. 1900.

20 Nov. 1900.

See 7578.

1839. Could you give us any idea of the amount per annum in pounds, shillings, and pence?—The figures are roughly about £5,000 per annum.

1840. Is that for the removing of mud deposit from the water of the tide coming in and out chiefly?—Yes.

See 1740.

1841. I will just draw your attention to that part of your evidence where you dealt with the costs which are put upon the company by reason of the total number of barges. You said that "the expenses necessarily incurred in docking, undocking, and handling the numerous craft which frequent the docks impose a serious burden upon the company," but you make no mention there of the cost of dredging?—No. Undoubtedly if we had not so many craft, and our locks were not open so long in consequence, the amount of dredging required would be somewhat less; but that is a matter that our engineer could speak to better than I can.

1842. I merely draw your attention to it, because it has been mentioned by other dock chairmen that it is a cost that falls upon the dock companies on account of the barges, and I wanted to know whether it is the same thing with the Surrey Commercial Dock?—Undoubtedly it is.

See 1743

1843. Then in another part of your evidence you said, this scheme for deepening the river "was to have been carried out within 18 months from January, 1897, but it appears that no attempt has yet been made to deepen or widen the river channel above the Victoria Dock entrance." Who undertook to do it within 18 months from January, 1897?—We found this statement in the report made by the London County Council upon the Port of London.

1844. Can you refer me to any authoritative statement by the Thames Conservancy?—I am afraid not.

See 7641.

1845. Now I will ask you a question on Appendix 15. I notice that the percentage of overside deliveries to total landed and overside deliveries has increased from 18.92 in 1890 to 40.58 in 1899. Can you give the Commission any reason for this very large and apparently continuously increasing percentage?—It is the general tendency of trade of all kinds to endeavour to economise every charge as much as possible, and if a man having a private timber wharf in London finds he can send a steamer into our docks, send his barges for it, and that we can charge him nothing on the goods that occupy our docks on the barge, it is naturally to his interest, instead of having these goods landed in the dock, to take them away direct from the ship's side to his own private wharf. That tendency is increasing year by year.

1846. I should have thought the tendency would have been quite as great in 1890 as in 1899. Self-interest was quite as strong in 1890 as in 1899.—The competition is much keener now than it was ten years ago.

1847. Then I will put this to you: If that is the case, do you think it will continue to increase?—That is a difficult question to answer. To a certain extent, there must be always a large amount of the goods intended for sale that must be discharged in our docks. If they are discharged at a private wharf, or discharged anywhere else, they are no longer available for current sale in the market.

1848. Then do you think the percentage has reached its climax?—No; I think if the power is not given to us to tax their goods to a certain extent, they will continue to find it to their advantage to take away an increasing percentage of goods from us. I do not think the percentage will mount up in the same rapid proportions that it has in the past ten years, but still I consider that the tendency would be towards an increase.

1849. If it did mount up, your position would be not quite so good as it is now?—Unfortunately not.

1850. It would be a very serious thing?—Very serious indeed.

1851. But is there any particular reason affecting the trade of London as to the opening of other places

for stacking of timber, or the different modes in which the trade is conducted, or other general considerations which have made this increase so considerable between 1890 and 1899, and which will not continue to make it equally considerable in the coming nine years?—There has been a little difference in the mode of trade, in this way—that people who buy a moderate quantity, 50 standards or thereabouts, ten years ago would have bought goods lying in our docks, but now they import themselves, and if they can, they take them away overside to their own places.

1852. Do the railway companies compete with you overside?—No, we have no competition that way.

1853. The engineer will, I suppose, tell us what the depth of water in the Channel, which you say is necessary, would be as compared with the programme of the Thames Conservancy?—I understand he has very full information upon that point.

1854. Your complaint against the Thames Conservancy, therefore, would be this—that their programme is insufficient, and that they are very much after time?—Our complaint, as far as we are personally concerned, is that our new lock will be available for receiving large vessels which by the time it is ready will not be able to come up to it unless at certain occasions of the tide. They will not be able to come up at neap tides.

1855. Unless the Thames Conservancy bestir themselves very quickly?—Decidedly.

1856. And you would urge that that should be done?—As far as we have any right to urge such a course, we certainly would do so.

1857. (Chairman.) Do many of your goods go by the Surrey Canal?—A very considerable amount of firewood goes up the Surrey Canal. Then the coals go up the Surrey Canal largely.

1858. What is the size of barges on your canal; what is the depth of water?—They are small barges—20 and 30 ton barges, and about 5ft. depth of water.

1859. Have you 6ft. depth of water in your canal?—6ft. 3in.

1860. The railway does not carry many goods away, does it?—We have nothing to complain of in regard to the railway taking away goods from us.

1861. What proportion of the goods goes away from your docks by railway?—Do you mean goods that do not pay us any revenue?

1862. Goods of any kind, whether grain or wood, or anything?—We have no means of checking that. We have really no direct railway communication in our docks.

1863. Which is your main road for the docks into London?—The Deptford Road.

1864. Have you a good access to it from all the docks?—Very good indeed.

1865. Have you made the roads themselves?—We have made the roads inside our docks.

1866. You have nothing to complain of in that direction as far as the land carriage goes?—No, we have nothing to complain of in that direction. I do not know whether it is germane to the present inquiry, but we complain very much of the enormous amount we have to pay away in rates.

(Mr. Ellis.) I think it would be convenient if we could have some information as to the point I raised with regard to the draught of water of vessels using the docks. 1833-7

(Chairman.) Yes, we want a return of the class of vessels, the tonnage, and the draught of water.

(Mr. Ellis.) During a series of years?

(Chairman.) The last five or six years will be sufficient, I suppose, for the purposes of comparison with what we have had from some of the other docks.

(Witness.) I presume that is a point upon which the engineer's evidence will be more valuable than mine. See 1928.

Recalled 7573.

(Adjourned to Tuesday next, November 27th, at 12 o'clock.)

# ROYAL COMMISSION ON THE PORT OF LONDON.

## SIXTH DAY.

Tuesday, 27th November 1900.

### PRESENT :

The Right Hon. The EARL EGERTON OF TATTON (*Chairman*).

The Right Hon. LORD REVELSTOKE.

Sir ROBERT GIFFEN, K.C.B., LL.D.

Sir JOHN WOLFE WOLFE-BARRY, K.C.B., LL.D., F.R.S.

Rear-Admiral Sir JOHN HEXT, K.C.I.B.

JOHN EDWARD ELLIS, Esq., M.P.

CECIL OWEN, Esq., *Secretary*.

Mr. JAMES STRANACK GASKELL, M.I.C.E., called and examined.

See 1748-53.

1867. (*Chairman*.) You are engineer to the Surrey Commercial Dock Company?—Yes. May I ask that before tendering my evidence I may correct a point in the evidence of our Chairman which was tendered last Tuesday before the Commission? The amendment has regard to Question No. 1748. The proper answer should have been: "No detention has taken place. The vessels could always come up the river to our docks when we were able to receive them into our locks."

1868. No detention to your knowledge. Of course, there might have been detention?—There might have been detention, but not to our knowledge. This amended answer to Question 1748 would, of course, nullify the answers to Questions 1749, 1750, and 1751.

(*Mr. Ellis*.) We ought not really to take a correction of the evidence of one witness from the mouth of another.

1869. (*Chairman*.) At Question 1753 I ask: "Do you know of any vessels in the wood trade at present which go to other ports in preference to London in consequence of there being a greater depth of water at those ports?" Can you answer that question?—No, I cannot answer that.

(*Mr. Ellis*.) I do not think we should alter on our notes by the mouth of one witness what another has said.

1870. (*Chairman*.) It involves several questions and answers. I am afraid they must stand on the notes with such correction as you have been able to give. Now will you give us the details of the locks and docks which have been referred to in the evidence of your Chairman?—The three existing entrance locks referred to in the evidence of the Dock Company's Chairman are distant below London Bridge one and three-quarter miles, two and a-half miles, and three and a-half miles respectively. The Surrey Lock is 250ft. long and 50ft. wide; the depth of water over sill at ordinary spring tides is 27ft. 3in. The South Lock is 220ft. long, 48ft. wide; depth of water over sill, 27ft. The Lavender Lock, 320ft. long, 34ft. wide; depth of water over sill, 18ft. 6in. The particulars of the different docks which are at present served through these entrance locks are given in a table which I will hand in, communication between the docks and the Surrey Canal being obtained by means of a lock 140ft. long by 21ft. 6in. wide, through which barges are locked down from the docks to the lower water level of the canal.

(*The Witness handed in a table giving particulars of the different docks of the Surrey Commercial Dock Company. See Appendix, 6th day, No. 1.*)

The whole of the docks, with the exception of the south dock, are at present served from the river through the Surrey entrance lock, which is situated about one and three-quarter miles below London Bridge. The Admiralty chart shows 12ft. as the depth of the river channel opposite this entrance. The south dock is entered from the river by the south lock at a point three and a-half miles below London Bridge. The river channel opposite this entrance is shown on the chart to be from 16ft. to 21ft. deep. The Lavender Lock, which is about three-quarters of a mile below the Surrey Lock, is used almost

exclusively for barge traffic and for the timber traffic in connection with the timber ponds. The depth of the river channel opposite this lock is shown to be 13ft. The site of the new entrance lock, which, together with the new dock now under construction, was referred to by the Chairman in his evidence, is situated about 550ft. above the south entrance lock, and nearly three and a-half miles below London Bridge. Opposite this entrance the chart shows the depth of the channel to be from 17ft. to 19ft. Owing to the amount of barge traffic that has to be dealt with, the work of unlocking from the Surrey entrance has to be commenced at a very early stage of the tide, the first lock out of barges generally being made at the beginning of the flood, five hours before high water. The locking of barges out and in goes on until about one and a half hours before the time of high water, when the vessels leaving and entering the docks are taken in hand. The time of discontinuing the barge work is to some extent governed by the size and number of vessels to be dealt with at that particular tide, and also by the nature of the tide. The inner dock gates are closed at the time of high water, after which vessels generally are not admitted. Any barges remaining to leave or enter are then disposed of. The necessity of having to make so many locks for barges at such a low stage of the tide (six and seven locks on the same tide being not an unusual number) necessarily involves the loss of a considerable amount of dock water. This has to be replaced by water from the river more or less charged with solid matter in suspension, which settles at the bottom of the basin and docks, and consequently adds materially to the amount of periodical dredging which has to be done for maintaining the requisite depth of water throughout the system. With vessels entering these docks, the general practice is that, with a view to ensuring safe conditions of working, they should do so on the rising tide; consequently, in the case of several vessels about to enter on the same tide, they have to be up the river and alongside, or near to the entrance, some considerable time before high water. In passing up the river, and just before arriving off the entrance, the vessel is swung round and her head pointed down stream, in order that she may be in the most favourable position for entering the lock. This swinging, in the case of ships bound for the Surrey entrance, generally takes place just off the Shadwell entrance to the London Docks; and in the case of vessels of 400ft. long, the whole of the fairway in the stream would be taken up at the time of swinging. The completion of the company's new dock and entrance lock will, should it be hereafter found desirable to do so, enable the whole of the larger class of vessels visiting these docks to make use of this entrance for obtaining access to any part of the dock system by means of the different communication passages leading out of the north and south sides of the new dock. This would not only leave the other river entrances free to deal conveniently with the smaller vessels and ships going out of the docks light, but would also relieve the river, for a length of nearly

Mr. J. S. Gaskell, M.I.C.E.

See 1743.

one and three-quarter miles between the new entrance and the Surrey lock, and over which the traffic is at present somewhat congested, of the heaviest ships now coming to these docks. Reference was made in the Chairman's evidence to the necessity for deepening and widening the present channel of the river, especially in the neighbourhood of the new entrance and above and below it, in order to render the new dock accessible to vessels of the class it is designed to take. In this connection I may be permitted to submit to the Commissioners that similar conditions of working will prevail with respect to this entrance as now exist at the Surrey entrance. Vessels will arrive at a comparatively early stage of the tide, they would have to swing in the stream, presumably at Limehouse Reach, before arriving at the entrance, and accommodation will have to be provided for the earliest arrivals to lie by during the interval which takes place between the time of their reaching the entrance and that of their admission into the dock. These, together with other points in connection with the general traffic, all tend to show that something more than a channel 500ft. wide is necessary, in that part of the river referred to, to meet the requirements of the company's new undertaking, in respect of its approaches from, and connection with, the river.

1871. You have given us the depth of the river channel opposite the locks?—Yes. The Surrey entrance lock is about one and three-quarter miles below London Bridge. The Admiralty chart shows 12ft. as the depth of the river channel opposite this lock.

1872. Is that Admiralty chart correct?—I am not prepared to vouch for the accuracy of the Admiralty chart.

1873. Have you ever tested the depth for yourself?—Yes, but not opposite to the Surrey lock. We have had no occasion to do so up to the present.

1874. Now the south dock?—The river channel opposite this entrance is shown on the chart to be from 16ft. to 21ft. deep.

1875. Have you verified that yourself?—Not personally, but it has been verified in my office.

1876. What was it then. You say it is from 16ft. to 21ft. deep. Is that correct?—The 21ft. would be the deepest point in the channel, but the floor of the channel is not of a uniform depth of 21ft.

1877. Has it been dredged lately?—I think not.

1878. You must know surely, as an engineer, whether it has been dredged or not?—I should say not.

1879. But do you say not—distinctly not?—Yes, I say not. The depth of the river channel opposite the Lavender Lock is shown to be 13ft.

1880. Has that been verified by you?—I am giving you the depth as stated on the chart.

1881. I want to know whether you, as engineer, can tell us if those depths are correct?—I have not verified that.

1882. (Sir John Wolfe-Barry.) Have you the chart there?—Yes.

1883. Perhaps you will tell the Chairman what the date is on the chart?—It is published on the 25th July, 1856, and corrected up to February, 1889.

1884. (Chairman.) How long have you been engineer?—My appointment dates from June, 1886.

1885. (Mr. Ellis.) Were you with the company in any other capacity before that time?—No.

(Sir John Wolfe-Barry.) To avoid any misunderstanding I may say that the chart is corrected up to 1897.

See 1742-3.

1886. (Chairman.) Now tell us about the new entrance lock which was referred to by the Chairman in his evidence?—Opposite this entrance the chart shows the depth of the channel to be from 17ft. to 19ft. I may say that that depth has been verified during the last two years.

1887. When will that new lock be finished?—We hope to have it finished in the course of another two years.

1888. The necessity of making locks for barges involves a certain amount of loss of water. How do you replace the water?—It has to be replaced from the river. We have no supply from inland at all. Any water that is taken up by locking has to be replaced from the river.

1889. And it is charged with solid matter which has to be dredged in order to maintain the depth of your docks?—Yes, in some cases very heavily.

1890. At what cost do you reckon that the dredging that you have to do in consequence of these operations

is carried out?—During the last five years the cost works out at an annual amount of £5,000 in round numbers.

1891. £5,000 a year?—Yes.

1892. You do not get any tolls upon those barges?—No.

1893. Nor dues upon the goods?—No.

1894. (Rear-Admiral Hext.) Can you give us the length of the longest ship that enters your docks, or that has entered them up to date?—I am not sure that I can give you the longest ship, but I can give you the lengths of three or four long ships that we have docked during 1898 and 1899. In April, 1898, we docked the "Strathnairn," 365ft. long, 47ft. beam. In February, 1898, we docked the "Oceana," 330ft. long, 45ft. beam. On January 9th of the present year we docked the "Brighton," 325ft. long.

1895. Practically we may take 365ft. as about the greatest length?—Yes.

1896. Do you bring the ships stern foremost into the dock?—No, the ships are swung before they get abreast of the entrance, and they are always taken in stem first.

1897. When they are coming up, on what tide?—On the flood tide. We swing them with their heads down stream, and they enter the locks on the flood. The docking is completed as a rule at our docks before high water. They come with the flood, and they swing with their heads down stream.

1898. Then in that case you require more than the length of the ship of deep water in the river to swing her length?—Yes, certainly, apart from the question of the rest of the traffic in the river, which of course the swinging stops for the time being.

1899. What do you consider should be the depth of deep water in the river to allow the vessel to swing in safety?—I should say that, as far as the vessel's requirements are concerned, if it is confined to the vessel's requirements, a margin of from 50ft. to 100ft. would be ample.

1900. That is in addition to her length?—Yes.

1901. (Chairman.) That means 500ft?—Yes; 500ft. for a 400ft. ship.

1902. (Rear-Admiral Hext.) Have you ever considered what depth of water you would like to see up at the entrance to your new lock; I mean the depth of water you would consider would be desirable to allow vessels to come up to make use of your new lock to its full advantage?—Yes.

1903. What depth do you say?—I think that the programme as sketched out by the Thames Conservancy and laid before the Commission last Tuesday would probably meet the requirements with respect to the channel itself, but it would not give my company what they wish for. It would not meet adequately the requirements of the new lock and dock for the purpose of convenient working. See 1384.

1904. Then virtually you accept the intentions of the Thames Conservancy?—As far as they go, but I say they are not sufficient for the satisfactory working of our new lock and entrance.

1905. What greater depth do you require?—I say I accept that programme as far as the channel of the river itself is concerned, but that does not cover all the dock company's requirements in respect of working the new lock.

1906. My question is:—When your new lock is completed, are you content with the proposals of the Thames Conservancy as sufficient to meet the requirements of that lock?—Not sufficient to meet the whole of the requirements.

1907. Then what increase do you require over their proposals?—I think the channel in the Limehouse Reach or Deptford Reach should be made considerably wider, in order to admit of the swinging of the largest class of vessels that the new lock could accommodate; 500ft. would not be sufficient for that.

1908. What greater depth do you require?—If the floor of the channel was maintained to a depth of 18ft. below low water, or 39ft. below Trinity, for its full width, that width being sufficiently wide to enable the largest class of vessels to swing, I think that would be sufficient. May I add that the programme as laid down by the Thames Conservancy provides nothing in the shape of widening the river immediately opposite the new entrance. There is no adequate deep water space for vessels to lie during the time that takes place

between their arrival at the pier-head and the time of their entering the locks, and it is very necessary that provision should be made for that, because in many instances we have five or six vessels coming up on a tide, and sometimes as many as five or six waiting outside the entrance to the dock.

1909. That was my object in asking you the width you consider necessary. You say 100ft. over their length. That would be 500ft. ?—I thought your question was confined to the channel itself pure and simple.

1910. No. I pointed out the swinging of the ship?—The ships would swing perhaps half a mile before they arrive at the entrance. In addition to the space for ships to swing we require additional space for ships to lie after they arrive at the entrance previous to their docking.

1911. (Chairman.) What additional depth. Suppose you have four or five ships waiting to come in what additional room and what depth of water would you require?—I think it is very necessary that the whole of the river bed, as far as practicable, should be dredged out to give us the same depth of water immediately opposite and in front of the entrance as the channel itself; that is to say, from the new entrance up to the Commercial Dock Pier.

1912. (Sir John Wolfe-Barry.) You gave us the length of the vessels, but you did not give us the heaviest draught that you have to take in?—From 24ft. to 25ft at present.

1913. Were you under the impression that the Thames Conservancy programme was for a channel of 500ft. wide?—That was my impression.

1914. I think the programme is 300ft wide from the Albert Dock up to the Millwall Dock?—I refer to the programme which was laid before the Commission last Tuesday.

1915. (Mr. Ellis.) The amended programme?—Yes.

1916. (Sir John Wolfe-Barry.) I am referring to the amended programme. My note is that it is 500ft. up to the Albert Dock, and 300ft. above the Albert Dock. At any rate your impression was that it was to be 500ft. ?—Yes.

See 1930

1917. And you say in addition to that you want some more room for swinging the ships?—Yes.

1918. For a length of about half a mile?—The ships entering the South Dock at present generally swing opposite the Cattle Market in the Deptford Reach; that is about three-quarters of a mile below the entrance.

1919. At any rate you want sufficient length for swinging?—Yes.

1920. In the evidence which was given which I took down at the time it was stated as 300ft. wide. It is in

Sir Frederick Dixon-Hartland's evidence in answer to Question 1384. However, your impression was that it was 500ft. ?—Yes.

1921. You cannot give us any evidence, I take it, as to the present width of the channel opposite the docks. You have not surveyed it?—As far as I know it is about 150ft. wide in the centre, giving a depth of 18ft. below low water spring tides.

1922. And as far as you know no dredging has been done in that part?—No, there has been no dredging as far as I know.

1923. The new lock of your company is to be of a length of 550ft. ?—Yes.

1924. What would be the depth of water on the sills at low water spring tides?—12ft. effective depth. In the centre, of course, it would be about 2ft. 6in. more, but the floor of the lock is in the form of an inverted ellipse, so that for practical purposes for the docking of vessels we reckon the sill to be about 33ft. below Trinity.

1925. Practically all ships would be able to dock there at every high water, neaps and springs, throughout the year?—Yes. We should get 28ft. of water effective depth over the sill at ordinary neap tides.

1926. I suppose one is right in saying that the vessels that come loaded with timber are not the deepest draught vessels that come into the Port of London?—No, not by a long way.

1927. Do grain vessels draw more water in proportion to their tonnage?—Yes.

1928. May I refer you to an answer given to Mr. Ellis at the end of your Chairman's evidence, Question 1866? Can you say of your own knowledge whether that return has been put in or do you put it in now?—We put it in now. It has only been printed this morning.

See 1866

(The Witness handed in a statement showing the total number of vessels in each of the years from 1895 to 1899 which entered the Surrey Commercial Docks with a draught of 22 feet and upwards, and the average tonnage of such vessels. See Appendix, 6th day, No. 2.)

1929. That will fulfil your Chairman's undertaking to give the Commission this information?—Yes.

1930. To prevent any misunderstanding about the width of the channel, the Secretary has been kind enough to refer to the evidence, and it is found that I am right, that the channel was defined as 300ft. wide above the Albert Dock to the Millwall Dock?—My remark was with regard to what I saw in print.

1931. Then a fortiori you would say the programme was insufficient?—Yes.

Sir THOMAS SUTHERLAND, G.C.M.G., called and examined.

Sir T.  
Sutherland.

1932. (Chairman.) You are the Chairman and Managing Director of the Peninsular and Oriental Company?—Yes.

1933. You have been Chairman for 20 years?—For 20 years, and 5 years before that Managing Director.

1934. What is the number of your fleet and the tonnage?—In round numbers about 65 vessels, aggregating upwards of 300,000 tons, and London is the headquarters of our service. We have regular lines all over India, China, Japan and Australia. A considerable proportion of our fleet is engaged in carrying Her Majesty's mails to and from all parts of the East.

1935. You changed from Southampton to London?—Yes, we did.

1936. In what year was that?—About 1875, in consequence of the opening of the Suez Canal, which altered completely the conditions of the carrying trade. Our trade depended upon the land route through Egypt formerly, and consisted of very valuable goods. The opening of the Suez Canal compelled us to become carriers of general cargo upon a large scale. Therefore we came to London in order to be nearer the centre of trade.

1937. What number of vessels do you despatch every year?—Rather over 100.

1938. Are they all from the Albert Docks?—Yes, all from the Albert Docks.

1939. You have your own quays there?—We rent quays and sheds.

1940. What is your largest vessel at present?—About 8,000 tons, and the smallest about 5,000 tons gross register.

1941. Have you none larger than 8,000 tons?—None larger than 8,000 tons gross register.

1942. Is not the "Caledonia" yours?—Yes, but there are five ships a little larger than the "Caledonia" which are the same kind of ships—the "India," the "China," the "Egypt," and the "Arabia"; these are all about 8,000 tons.

1943. (Sir Robert Giffen.) About what does the net registered tonnage amount to?—The gross tonnage, for instance, of the "Arabia" would be, as I have said, just over 8,000 tons, the net tonnage 4,167 tons. If you would like to know the carrying capacity for cargo of that ship with that net tonnage, it would only be about 2,000 tons.

1944. (Chairman.) What is the length of that ship now?—500ft.

1945. And the depth?—What we call the depth of the vessel is nearly 33ft.

1946. (Sir John Wolfe-Barry.) But what would be the draught of water?—26ft.

1947. (Chairman.) It is a matter of notoriety that your ships have doubled in tonnage within the last twenty years?—Yes.

1948. Then you have, besides the mail steamers, other cargo steamers?—We have a good many cargo steamers.

Sir T.  
Sutherland.

27 Nov. 1900.

We have, I suppose, about two or three entering the docks every month—always two, at least—so that our total carriage of cargo is somewhat large; it amounts altogether to nearly 400,000 tons of cargo imported and about 340,000 tons exported.

1949. Do you deal with the export cargo differently now from what you did previously?—The export cargo is treated in exactly the same way as it was formerly. A certain percentage goes in through the dock warehouses—about 45 per cent., we compute, enters through the dock warehouses; and about 55 per cent. is barged into the dock.

1950. On which you pay no dues?—On which no dues are paid by shippers.

1951. Will you tell us how you now deal with the import cargo which is different to what you used to do?—A very important alteration was made in the system after the great strike of 1889. Previous to that time the dock claimed—I am not sure whether they had a legal claim—but, at all events, they claimed and exercised the right to unload our ships and to pass the goods through their warehouse for the purpose of sorting and re-delivery. The expense of landing the goods fell on the shipowner, and the cost of sorting and re-delivery in the case of all goods which passed out of the hands of the dock company was also borne by the shipowner, so that the consignees had a free delivery of all such cargo so far as the shipowners and the docks were concerned. I should explain that the dock company made a considerable profit on the landing and re-delivery charges thus paid by the shipowner, but the great dock strike in 1889 and the subsequently disturbed state of labour in the East End of London showed that if the dock company continued to discharge all the ships, as up to that time they had done, the risk of labour agitation against the dock company would be very great, and both the dock company and the shipowners desired to effect such a change as would place the responsibility for the discharge of their vessels upon the shoulders of the shipowners instead of being in the hands of the dock company. An arrangement was therefore come to by which owners like the P. and O. Company agreed to rent certain warehouses and quay space at a fixed rate, and carry on their own work. This shed and quay rent compensated the dock company for the profit they sacrificed in ceding the right of discharge to the shipowners.

1952. Are you able to say what rent you pay for the quays and warehouses?—It is in round figures just about £5,000 a year.

1953. You say owners like the P. and O. Company; are there many others who are on the same terms as yourself?—Yes; I may say that all the principal lines coming to the Albert Dock engaged in eastern trade are, I think, on the same footing. I may mention here that in whatever I say I am expressing the view not only of the P. and O. Company, but of the British India Company, who are perhaps the largest customers of the dock next to ours, or one of the largest.

1954. Is this system which was started then like the Liverpool system, or how does it differ?—No; not at all like the Liverpool system; the very opposite. In Liverpool the shipowner gets rid of the whole of his cargo at once, and is done with it.

1955. Do you prefer this system to the Liverpool system?—No, not at all.

1956. Do you think the Liverpool system is the best system?—From the shipowners' point of view it is most unquestionably the best system, because it is the quickest system for getting rid of his cargo.

1957. Is that one of the reasons why shipowners like Liverpool better than London?—As a method of transacting business in connection with the discharge of cargo, the Liverpool method is preferable; but, of course, the trades of Liverpool and London are more or less distinct; they overlap each other at certain points undoubtedly, but still they are more or less distinct. We could not carry on our present trade by going to Liverpool.

1958. You run to Australia, do you not?—Yes.

1959. Do you carry wool in your vessels from Australia?—Yes.

1960. Still?—Yes.

1961. We understood that a great deal of trade that used to come to London in the way of wool now goes through Liverpool and Manchester to Yorkshire?—I think London is still the principal seat of the wool trade.

1962. Has your import of wool diminished in any way?—No; a great deal of wool formerly used to come to London which now goes direct to the Continent; that is well known.

1963. Therefore London loses the re-export trade?—Undoubtedly; but you may say the same with regard to a great many other trades. You may say the same, for instance, with regard to the silk trade, which before the days of the Messageries Maritime centred in London, and has all been transferred to the Continent. It is a trade not existent in London now.

1964. You think that that change has been rather owing to the opening of the Suez Canal than to any other cause, such as the unpopularity of London as a port?—It had commenced to take place really before the opening of the Suez Canal; but no doubt the opening of the Suez Canal accentuated that change very much.

1965. Will you state now the change that took place in 1896?—Yes; I think it was towards the end of 1896. The arrangement which I have just described had worked smoothly up to that time. The dock company then sought to raise increased revenue by means of imposing a tax of sixpence per ton on all goods brought into the dock which did not remain for the purpose of storage in the hands of the dock company.

1966. Do you mean what was taken by lighters?—On everything; not only what would go out by lighter, but it might be delivered by road, so long as the dock company did not get the storage of it. They wished to impose a tax of sixpence a ton on everything that was not stored with them.

1967. Upon all the goods in the dock?—Not altogether, because in the case of our ships, for instance, I think I am right in saying that the dock company retain about 18 per cent. of our cargo for the purpose of storage.

1968. Now?—Yes. Therefore the proposal would have been to levy a charge of sixpence a ton on 82 per cent. practically. Of course, a charge of that kind would have been impossible for us to recover from our consignees; it would have amounted at once to a charge upon us of £5,000 to £6,000 a year, in addition to the charge which we were then paying for warehouse and quay rent, and in addition, of course, to the dock dues, and as we naturally found that this charge would be very much in excess of what we ought to pay or could afford to pay, we struck against it, and really took up a policy of building wharves on the Thames. I may say that we invested in land for the purpose, and would undoubtedly have carried out that policy, but the dock company afterwards saw reason to compromise the situation, and we did compromise it.

1969. You mentioned that you have bought land. Have you got that land still?—We have. It is the whole of what you see in the map called St. Clement's Reach. The whole of that land on the north side of the Thames belongs to us.

1970. Rather than go to capital expenditure which would enable you to work these wharves you agreed to pay this £1,500 a year rent?—Yes, we compromised it.

1971. Do you think that that is a solution with regard to the extension of the dock system—the creation of wharves in the river itself in the same way, say, as at Calcutta?—I do. I think there is a great field for the construction of wharves on the Thames.

1972. You think with the tendency to have large ships, the rapid discharge that is required would be better obtained by not having a system of docks, but as far as possible canalising the river?—I do to a very large extent. Our experience at Antwerp, where we have been in the habit of sending our ships since the year 1883—ever since I may say that expensive quay system was created—has created a very favourable impression in our minds with regard to what can be done on the river by means of deep wharves. The great question with shipowners is rapid working, especially rapid discharge. Rapid loading is another question; he cannot load so rapidly as he would like.

1973. Did you ever get any estimates as to what it would cost you to build the wharves that you would require?—It would have depended very much upon the extent to which we should have desired to carry out our particular work there. We considered the matter and especially the nature of the dredging which would be required, because at a portion of the land the water is deep and at another portion the coast would have required to be

See 2822

See 2144

dredged. While we were considering that very anxiously the dock company withdrew from the position which they had taken up in reference to what we call a royalty upon all cargo, and the compromise which I have mentioned was effected.

1974. Your engineers never went so far as to draw plans or anything of the kind?—Well, we did draw plans, but they were not plans sufficient for the purpose of obtaining estimates.

1975. Do you say that the cost of discharging ships under the old system was less expensive than under the new?—The old system was less expensive than the new. I say also that is the case, notwithstanding the fact that in order to economise the company discharge a large portion of their cargoes overside and avoid the expense of passing through the dock warehouse. I can give you actual figures as far as the old and the new methods of working are concerned, but I should say that the actual figures do not represent in any degree the cost to us, because under the new system of working we have a vast amount of what we call overtime, and that it is impossible to introduce into the calculation which I mentioned. The former cost of discharging a ship and subsequently of passing the cargo over the quay to the consignees to give them free delivery, we estimate, exclusive of overtime, as having cost us about 2s. 5d. a ton. I should mention freights are very often 10s. a ton. Then on the present system we calculate, without overtime again, that it costs us about 2s. 7d.; that is a difference of 2d. a ton. But as I say that does not represent the whole of the extra cost, because in working under the present system, and with the large cargoes with which we have to deal, we have to pay for a great deal of overtime, and that I do not bring into the calculation.

1976. The calculation you are now making is the difference between the present system and what you had previous to 1889?—Yes, what existed before 1889.

1977. You have your own staff of labourers, or whatever you call them—the different employees?—Yes, our own superintendents and our own staff.

1978. Whereas, previously the dock company did the work?—Our staff was previously very small in comparison with what it is now.

1979. You say that you discharge a large portion of your goods overside on account of economy. Is that the most rapid way of discharging your vessel—in lighters?—No; the most rapid way would be to discharge the whole cargo into the dock warehouses, as is done in Liverpool.

1980. You mean with double floors?—Yes. As a matter of fact, if we wish to discharge the whole of our cargoes into docks, which we cannot afford to do because the cost would be so great now under the present system, it would be impossible to do so because the present dock warehouses would not contain the large cargoes which are received in the port.

1981. That is the complaint that you have to make of the docks as they are at present; that in order to make them effectual for your purpose you require larger warehouse or shed accommodation; is it both warehouse and shed? I draw the distinction between warehouse and shed. In Liverpool there is a great deal of cargo which is discharged into sheds where the goods remain for a certain time, and of course there are permanent warehouses. Are you speaking now of temporary sheds?—I am speaking now of the dock sheds.

1982. You mean the warehouses for temporary purposes?—Yes, for temporary purposes. The warehouse is a shed in the dock in which goods are placed in order to be sorted, and subsequently re-delivered. What I say is that it would be impossible for us if we wished to do so to put the whole of our cargoes into these temporary sheds, and therefore we are compelled, whether we like it or not, to discharge a large portion of our cargo overside. As a matter of fact, we do discharge overside, not only because we are obliged to for the reason I have explained, but also in the interest of economy. Whatever cargo we put into the shed at the present time we have to pay for taking out again, and giving to the barges and to consignees in any other way, outside the 18 per cent. of the total which the dock company retain for the warehouses.

1983. You are obliged to use a system of discharge which is not so rapid as you would like, on account of the economy of it?—In the first place I should like to explain that there is not the room. I may give a very clear illustration of that by saying that owing to the

barge strike which has existed for the last few weeks in the Thames the state of these warehouses becomes so congested that a merchant told me only the other day that he actually had not received goods six weeks after the ship had arrived. The dock sheds are now, I say, entirely inadequate to the system which ought to exist, namely, a system of complete discharge of the ship to the shore. It ought to exist of course under conditions which would necessarily relieve the shipowner to some extent of the great expense which he has to incur in re-delivery.

1984. You do not at present have experience of other ports, do you? I want to know whether you send any of your ships to other ports?—I have no personal experience myself of Liverpool; we have sent a ship or two there; but I have a great deal of personal experience of Antwerp. But we go to Antwerp more for loading than for discharging, therefore the point does not arise about which I am now speaking.

1985. You take Continental goods for export to the East, I suppose. Is it after partly loading in London that you go over to Antwerp?—After discharging our ships in London we send over our ships to Antwerp to load, because the goods are too heavy to be transhipped in London. The shipments in Antwerp mostly consist of deadweight. I suppose we send on an average about two steamers every month to Antwerp in that way; at least we did until very lately.

1986. From what you see of the wharves at Antwerp, you think they are better suited for the modern system of cargoes and the modern system of large ships than the Port of London?—I do in a great many ways, certainly.

1987. Have you ever endeavoured to make any better terms with the dock company as to these things which you want? Has there been any interchange of views between you?—We have to take the docks as they are, and I am afraid that the docks have very considerable difficulties in the way of finance. As far as I know, there is no possibility of changing the system which exists now in the docks unless there is an entire change in the system of the port.

1988. Are you in favour of any such change?—Yes, I am very much in favour of change. I think the present system of the Port of London is disgraceful for the nineteenth century.

1989. I do not ask you anything as between docks and shipowners, as I understand, if necessary, you may be represented further on in regard to any question which arises as to the imposition of future dues and so on?—Certainly.

1990. I presume you are aware that there is proposed legislation in Parliament, and I suppose you do not approve of it. I will ask you that just generally?—Certainly. I should be very sorry to have to create a plan myself, but I have no doubt that the Commission will be quite equal to it.

1991. We rather look to gentlemen of your experience to give us some lead in the matter; we are not experts?—A private individual like myself could hardly venture to attempt to formulate any plan in a matter of that kind, but I think, after the whole of the evidence is before the Commission, if your Lordship and your brother Commissioners were of opinion that the system ought to be altered, the onus would be upon somebody to create a plan. What I should like to make clear at this point is that the difficulties which the dock company have had to contend with have arisen in no way at all events from a scarcity of tonnage. We and other companies have continued to contribute upon an increased scale to the revenue of the dock company by increased tonnage. Our own fleet, I think, must have increased to about three times what it was in 1875. At the same time we feel strongly, under the present port system and dock system, that shipowners are not on solid ground at all, but are very liable to have their business further interfered with in the interest of the dock shareholders, and without increased efficiency or advantage to the shipping world.

1992. Would you state what you consider to be defective in connection with the port and docks?—I think with regard to the port, in the first place, that it is a very great danger that large vessels such as we and others now employ should not be able to lie with safety off the dock entrance, or in any part of the river above Erith. We have been obliged to send ships which are already off the docks waiting to enter, back all the way to Gravesend. That, I need hardly say, late in the afternoon in winter, is a very serious thing

Sir T.  
Sutherland.  
27 Nov. 1900.

Sir T.  
Sutherland.  
27 Nov. 1900.

to be obliged to do. It has not happened very often, but still I have four or five cases in which it has happened. The last case was the case of the "Caledonia." She had come up ready to enter the dock. I believe there was some accident—I am not blaming anyone in connection with it—and she had to steam all the way back to Gravesend.

(Mr. Ellis.) Can you give us the date when that happened?

1993. (Chairman.) Will you give us all the cases that you have, please?—Yes. The "Caledonia" had to go back on June 8th of this year. That is the last case. The previous case to that was the "Borneo" on November 21st, 1897. She had to go back on a winter's night; it was a very bad winter's night indeed. Then the "Shannon" returned in the same way on January 23rd, 1896; and the previous case to that was some time before, in January, 1889, the "Khedive." Three out of the four cases happened in the depth of winter. Then we say that ships on leaving the docks are sometimes overtaken by fog, and if that occurs in the shallow part of the river above Erith, the ship must get aground and incur very considerable danger in the case of such heavy vessels that are coming up to the docks now displacing some ten or twelve thousand tons. Our contention is that, taking into consideration the increasing size of ships, the river ought to be deepened as far as the Albert Docks at least to 25ft. at low spring tides, with a width of channel of at least 500ft.

1994. Now as to the docks?—You ask me now with regard to the docks. I speak of the Royal Albert Docks, on which our experience rests. I believe that it is admitted by the dock authorities that a new entrance to this dock is necessary. I believe at present it would be unsafe to bring a ship into the dock more than 517 or 520ft. in length. We had plans drawn up for a ship 530ft. long the other day, but it was proved to us that it would be necessary to send such a ship either to Tilbury or to Southampton. Our present largest vessels are only 500ft., but we contemplate the construction of ships of considerably greater size. Then, undoubtedly, the graving dock accommodation is inadequate. There is a new graving dock required capable of taking in ships drawing 24ft. at least.

1995. What is the largest graving dock in London?—Tilbury is the largest.

1996. Is that as large as the largest at Liverpool?—I fancy there are larger graving docks in Liverpool. I wish to say that I am very desirous of not appearing or wishing to make any complaint against the docks. The docks are poor we know very well, and have to manage their business with most rigorous economy, but undoubtedly if you walk through the docks and see the state of their quays, and if you look at their tugs, which are pretty well coeval with Noah's Ark, I think, and their appliances in general, you will see that the expenditure is kept down to its lowest possible point, and one which I should myself say is hardly compatible with efficiency.

1997. What would you recommend for the most rapid discharge of a vessel?—I say that the shipowners ought to be able to discharge their ships in dock on to the dock quay entirely as they do in all great ports, and that subsequent handling of goods, if they are to be taken away by barges for the convenience of consignees, should be at the cost of those consignees; but in the present state of the dock plant and of their warehouses, which are simply ground floor sheds, it would be impossible to discharge *in toto* the large cargoes which are now brought into the dock. That is merely a repetition, so far, of what I have said before. I say, to bring the system up to date would involve a reconstruction of those sheds to a height of two floors at least, as the superficial space of the docks would be hardly sufficient to make them large enough with one floor only.

1998. Three floors might be desirable?—If they had space enough I should prefer, of course, that the sheds should be of one floor, but they have not got space enough. That appears to me to be the state of things to be aimed at from a shipowner's point of view, as rapid discharge is the most vital of all questions.

1999. Is it not a fact now that the large vessels that come into docks have very nearly always a mixed cargo that requires sorting?—Yes.

2000. And that can best be done, I presume, on the quays?—Certainly.

2001. On the quays or in covered sheds open to the quays?—Certainly.

2002. Those goods are sorted much more expeditiously in that way than in any other?—Certainly.

2003. It is difficult to sort goods in a vessel, into lighters, is it not?—Very.

2004. Because if you have a mixed cargo—grain, for instance, and a variety of mixed goods, you have to get them all sorted before you get down to the grain?—It is extremely difficult, but necessity drives us to a good many shifts. To give you an instance, we load our cargoes in Calcutta, and we load our cargoes in Australia, as far as we possibly can with a view to their being discharged partly overside and partly on to the dock quay. We know from experience that certain goods will go to wharves, and certain goods will go into lighters, and so on, and if we can possibly arrange it in loading our ships, we put these goods into a position to be handled more easily, but, still, that is, at the best, a very imperfect system compared with the total discharge of a ship and subsequent sorting.

2005. I suppose it is very difficult for all ships to be loaded with such care as you mention?—Yes, in the trades in which we are engaged, I may say, the goods are carried on what are called "liners," that is to say, ships running regularly in the trade. They do in all probability much as we do. Perhaps some of them do it a great deal better, but I am not sure of this, but what I say is, if this re-construction of the London system were to be effected, I have no doubt the docks would obtain a far larger quantity of goods to store than they do at present. If, on the other hand, a large proportion of goods is to be turned away for the convenience of the merchant and the benefit of the wharfinger, it does not seem right that shipowners should pay for that convenience. If I were in a Court of Law I should not be allowed to express an opinion, I should only be allowed to state facts; but I wish to say that I speak the views of leading shipowners, I think, who are trading to these docks, in saying that, in the interests of public policy, the administration of the Port of London and the docks should be in the hands of an authority constituted *ad hoc*, which should have powers not likely to be given either to the present Conservancy Board or to the dock companies to impose such dues either on ships, on river craft, or on goods, as would appear necessary for the purpose of raising a sufficient revenue for the improvement of the port and the extension of the dock works or construction of wharves, in whatever direction such improvement may be found necessary. I also venture to say that the future interests attaching to this question are too grave to be committed to the hands of private individuals, such as the dock directors are, whose policy must necessarily be based on the desire of their shareholders to secure a market value for their property, which it certainly does not possess at the present time, and is not entitled to obtain at the expense of shipowners. Of course what I say in reference to the docks applies equally to the existing Conservancy Board.

2006. Then you think that such a body should be a representative body?—Certainly.

2007. The public authorities of London, and shipowners, and the Chamber of Commerce should have representatives on it, you think?—I think it would be one of the most important bodies that has ever been created in the United Kingdom, and its constitution, of course, would require to be very carefully considered indeed. It would be partly representatives elected and partly nominated. I am not sure that at first starting, at all events for some years, I should not be in favour of a considerable nomination for such a body, but subsequently—even perhaps from the first—the constitution should be an elective one. There are so many interests to be considered in connection with that that it would be very presumptuous for me, as a private individual, to give anything but a broad view of what I think is a necessary change, but I have no doubt that after the evidence which is being taken by this commission is completed, various bodies will be ready to come forward with suggestions.

2008. But you are Chairman of the Peninsular and Oriental Company, and you represent not only your company. I presume, but the feelings of other large shipowning companies?—Yes. I represent to-day the British India Company. I may say that I represent generally the feelings of those large companies regu-

larly trading to the Port of London. In fact, I know that I do.

2009. You have not formulated any idea as to how the revenue is to be raised, have you?—The revenue must be raised, of course, from ships and dock dues, and I think also from goods. In every port in the kingdom, as far as I know, goods are made to contribute, and, though you may perhaps think that I am acting on my selfish shipowner's feeling, I say that it is more important that you should make a port cheap to ships than that you should refrain from exacting some contributions on goods, because the initial effort in creating trade, after all, depends upon shipping; and if a shipowner finds a port cheap so far as he is concerned, he will most likely bring his trade there. The mere charge of a few pence upon goods will never have the effect of preventing goods from being carried. I was just going to show you a little calculation which I have here as to the difference between the cost of a ship entering the docks in London and going to the quays in Antwerp. I take a ship of our own, like the "Candia," which is a purely cargo vessel, and I find that she pays in conservancy dues at 1½d., £25; in dock dues at 1s., £200; in light dues, at 2½d. each way, £91. Exclusive of pilotage—I have not brought the pilotage into calculation for certain reasons—the total cost of bringing that ship into London into dock is £316 13s. 4d. If we send her to Antwerp, the total dues she pays are quay dues, equal to 3½d. per ton, £54 3s. In one case the shipowner pays £54 3s., and in the other case he pays £316 13s. 4d.

2010. Is that exactly under the same conditions, without touching the cargo at all?—It is for these items which I have given you.

2011. They are only shipping dues?—Yes. If I were to develop the calculation further into the other expenditure, in London it would assume very much more formidable proportions; but I simply give the difference on certain points.

2012. That is very valuable as far as it goes, but we should also like to know the difference between the cost in London and Antwerp, or any other port that you are acquainted with?—For loading and discharging, you mean?

2013. Yes. Say cargo of a similar kind, because what we want to know is how far London is a dearer port than other ports in the United Kingdom or the ports which compete with us abroad, like Antwerp?—I do not think there would be very much difficulty in giving you absolute figures for a ship as between London and Liverpool. Of course, it is very important to have the same ship. But as between London and Antwerp it would be difficult to go much beyond what I have stated, because, as I say, ships chiefly load in Antwerp—at least our ships do—they do not discharge. We hardly take any cargo over there. The discharge rate, of course, it is easy to get.

2014. (Sir Robert Giffen.) Were these dues that you have given us the dues of a ship going into Antwerp to discharge?—These have nothing to do with the actual cost of discharging, which is a labour charge. These are dues compared with the dock charge.

2015. But sometimes dock dues here are different upon a loaded ship from what they are upon a light ship. My question really is whether the ship that went into Antwerp was light and the ship that went into London was loaded?—I do not see where the difference comes in.

2016. We are told here that a light ship going into the docks does not pay the same tonnage dues as a loaded ship, or is exempt altogether?—But if she subsequently loads in dock? A ship may go to the dock in ballast. If she subsequently loads in dock I do not know that she pays lower rates.

2017. I wish to be quite clear upon all the points of comparison?—I do not think it has a very important bearing, but it may have some little bearing. My impression is that if a ship goes into dock in ballast and loads in dock she pays the same as the loaded ship.

2018. (Mr. Ellis.) Can you assure us that in that comparison you are comparing like with like? That is the whole point?—To the best of my belief I am comparing one ship under the same conditions as another.

2019. You will admit that the whole value of the comparison depends upon that?—The figures are so wide that even if you assumed that there is some slight difference it would be immaterial.

2020. (Chairman.) In order to make the comparison perfectly fair we ought to know exactly what the conditions of the port of Antwerp are, and how far they are subsidised by municipal or public funds, and are therefore able to give cheaper accommodation for vessels. From one point of view that is important, although, as far as the actual sum which the shipowner has to pay goes, from your point of view you do not care what the cause of the reduction of the charges is as long as they are less?—In one respect the port of Antwerp is fortunate. They have a civilised government, which pays light dues. Excepting Turkey, Great Britain is the only other country, I believe, which charges light dues. But the fact remains that to the shipowner who does not go into those questions the difference in point of cost in working the quay at Antwerp and working the docks in London is a very important matter.

2021. (Sir Robert Giffen.) Can you tell us at this point the reason why you omitted pilotage?—The reason is because I have not got the proper figures for the pilotage of what I may call ordinary vessels. We carry pilots, as it were all the year round. I have the figures for that, and I may say in passing that it is one of the hardships which we think we have to contend against that we are compelled to pay those gentlemen—very excellent men—much larger salaries in the course of the year than we pay to our captains. Our pilotage to the Port of London is on that account very much higher than the casual pilotage. If I were to compare the casual pilotage in the Port of London with the casual pilotage in the port of Antwerp I think the port of Antwerp, seeing that the river is so very much bigger a thing, would come out about 25 per cent. higher in pilotage; but I have not got the actual calculations upon that point.

2022. (Chairman.) It is rather important that we should have your opinion as to whether you think it is desirable that all these questions of buoying and pilotage, which are now partly under the Thames Conservancy and partly under Trinity House, and partly under the Government, should all be under one Board?—Most distinctly.

2023. You think that the Conservancy Board should only deal with the upper part of the river from London Bridge?—To London Bridge, I suppose.

2024. (Sir John Wolfe-Barry.) What is the tonnage of the British India Company?—Do you mean the tonnage of individual ships?

2025. No; the gross tonnage you represent?—The tonnage coming to the Port of London is not so large as ours, most of their business being coasting business in India.

2026. Do you find that the system of discharging overside into barges is a growing system, and getting larger?—Yes, I think so.

2027. Therefore, if the docks are suffering from it now financially, they will suffer from it more in time to come?—I should think so.

2028. Have you formed any opinion whether the Liverpool system would be suitable to the Port of London?—The Liverpool system, in my opinion, would be very suitable for a considerable portion of the trade of London at all events, but no doubt the wharf system in London has a big footing in connection with very many trades. Why the dock companies have allowed all this storage business to slip out of their hands in all these past years is more than I can see; but at all events the wharves have a very big hold in that direction, and it would be a question whether, if we are to have one authority for the Port of London, the wharves should be embraced, as it were, within that authority, or whether the docks should be put in a proper and efficient state to do a great deal more work in the way of storage of goods than they do now. If that were done, I think it would be rather a bad look-out for the wharves.

2029. You mean that they would then compete with the wharves on better terms than they do now?—I think so. It seems to me to be absurd that there should be so much moving about of cargo as there actually is in the Port of London.

2030. The great desideratum nowadays is, is it not, to discharge a ship very quickly?—That is my opinion.

2031. On account of the great expenses which fall on the ship when she is lying idle?—Yes; the great desideratum is rapid discharge.

2032. The shipowners would urge that before a

Sir T.  
Sutherland.

See 3423;  
3511;  
3628.

*Sir P.  
Sutherland.*

27 Nov. 1800.

anything, and, I suppose, would consider that within certain limits despatch is worth paying for?—Just so.

2033. (*Mr. Ellis.*) You mentioned that the average tonnage of each of your ships has doubled within the last twenty years?—Yes.

2034. Can you give us some idea of the increased draught of water of your vessels during that time?—The increased draught of water is not so great as one would suppose from the doubling of the tonnage, for two reasons. In the first place, the ships constructed nowadays are lighter, they are made of steel; and in the next place they have very much better forms—more buoyant forms—than the ships which were constructed five-and-twenty years ago, which were all wedge-shaped, and so on. In the next place, our ships are all built so as to go through the Suez Canal on a draught of 26ft.—in fact, 25ft. 6in.—in salt water.

2035. That is your guiding point. The Suez Canal determines things?—Yes, that is our guiding point.

2036. Then the whole of your 65 vessels are under the figure that you have just mentioned?—Yes.

2037. You have no vessels drawing more water than that?—No; 26ft. is what we aim at, but that we shall have vessels drawing more than that I have no doubt, and that in course of time the Suez Canal will admit of vessels of deep draught going through it I have also no doubt. The Suez Canal has been deepened within the last few years 3ft.

2038. And the process is likely to go on?—Yes, that is the tendency—bigger ships, and therefore deeper draught.

2039. You attach very great importance to this deep-water channel, I think, do you not?—Yes.

2040. You were many years in the House of Commons?—Yes.

2041. It was through your act that the Instruction was carried on the 28th May, 1894, which eventuated in Section 189 of the Thames Conservancy Act, 1894?—I remember it was so.

2042. You succeeded in persuading the House of Commons by a large majority to pass that Instruction?—Yes.

2043. Therefore you are really the parent of Section 189?—Yes. We were astonished at the largeness of the majority.

2044. Do you think that the end and aim of that section has been satisfactorily carried out?—I think it has never been paid any attention to as far as the Conservancy are concerned. The Conservancy have no funds, and if the Conservancy were to come to Parliament it would be a very bad look out for the Conservancy.

See 2070-6.

2045. I will refer to that in a moment, but with regard to Section 189 of this important Act of Parliament, I am to take it from you, speaking with grave responsibility, that in your opinion it has not been satisfactorily carried out?—Absolutely not.

2046. The intention of Parliament has been a *brutum fulmen* so far as that section is concerned?—Yes.

2047. With respect to the constitution of the Thames Conservancy, you moved also on the Third Reading of this Bill to re-commit the Bill?—Yes.

2048. That was a strong step after a Bill had been thirty days before a Private Bill Committee?—Yes.

2049. What was your reason?—I think my reason was more for the sake of entering a protest than with any hope of carrying the motion.

2050. As a matter of fact you made a speech, and on the appeal of the President of the Board of Trade in the debate you withdrew your motion?—I did.

2051. Your motion was: "That the Bill be re-committed to the former Committee, and that it be an instruction to the Committee to insert provisions in the Bill for establishing distinct statutory Committees of the Conservancy Board to manage the upper river and the lower river (including the port and harbour), to define the limits within which the jurisdiction of such Committees should respectively extend, and to provide for allocating to purposes of the lower river, port and harbour, the income arising therefrom." Do you hold that opinion still?—Certainly.

See 1586-7.

2052. It has been suggested by the Chairman of the Thames Conservancy before us here that you have altered your mind on that point. Is that correct?—No.

2053. In your evidence you deal with this point: You said "I think the Conservancy Board should deal

only with the upper part of the river, and that the Port of London should be under the authority which from my point of view requires to be constituted for that purpose and for the control of the docks"?—Yes.

2054. You come before us speaking the mind of the P. and O. Company, and the minds of others?—Yes. I think I represent—I do not like to say entirely the shipping interests of the Port of London—but I think I represent, in the view that I have expressed, the largest shipping interests trading to the Port of London.

2055. And you suggest to us that if this Royal Commission arrives at any conclusion and proposals on the matter it will be incumbent on some Government Department to frame a Bill?—I do.

2056. That will be the Board of Trade, I suppose, because we are here through the action of the Board of Trade?—Yes. If this Commission finds the present state of things is unsatisfactory, and the general tenor of the evidence runs in the direction of constituting a public authority of the port, it will certainly be incumbent on the Government to frame a Bill.

2057. You have indicated to us some of your views with regard to the constitution of that public authority. Have you anything to add to that at all?—No, I think not. I need hardly say that the representation of the shipping interest in the present Conservancy is rather ridiculous. I think there are three shipowners out of a total of 38.

2058. That is going back to the constitution. We have dealt with that to a certain extent. May I take it from you that you think that this would not be a task beyond the wisdom of Parliament, and that it would conduce greatly to the commercial interest of the Port and City of London?—I hold it to be imperatively necessary that a change should be brought about in that way.

2059. (*Rear-Admiral Hext.*) The Chairman of the Thames Conservancy stated that until the depth of water over the sill of the Albert Dock is much increased, there would be no practical advantage in forming such a channel as the channel advocated. Do you agree with that?—No, certainly not. What we want increased depth of water in the river for is for the purposes of navigation. We have no difficulty whatever in getting our ships into dock over the sill of the dock some hours before high water, or some hours after high water, but what we require increased depth of the channel for is to enable ships to anchor with safety in case of need, and to swing opposite the dock wall waiting to get in or to get out, as the case may be. There is no relevancy or connection between what we advocate and the sill of the dock.

See 1384.

2060. With regard to the system of discharging cargo, you are clearly in favour of the American system, as far as regards the shipowners' point of view?—I am clearly in favour of ships getting rid of their cargo *in toto* in the same way as they do in Bombay, in the same way as they do in Calcutta, in the same way as they do in Shanghai, and in the same way as they do in Liverpool.

2061. (*Sir Robert Giffen.*) I did not quite gather whether the balance of your opinion is in favour of a public authority embracing wharves, or leaving them out?—It is more than I can tell you. I should like to give you an opinion upon the point, but I have not got sufficient information about the wharves to say. When the wharfingers give evidence here, if they do give their evidence, I think it would be possible to form an opinion upon that point, but not before. My first impression is that the public authority should not necessarily include the wharves. I think they may be very anxious after some time to be included.

2062. Are you satisfied that as shipowners you have done all you can to improve the system of the Port of London by insisting upon alterations in the bills of lading, and other means within your own powers?—There is always, no doubt, some room for improvement, but my impression is that the shipowner, who is a very intelligent person upon the whole, does his very best in that and every other direction.

2063. Then there are real difficulties in the way of the shipowners rectifying their position, and making it necessary to have a rearrangement of the port?—I think the rearrangement of the port is the first thing.

2064. And that cannot be done by the shipowner?—If we were to alter our bills of lading to-morrow, the

dock accommodation could not discharge the whole of our cargo.

2065. So that you cannot alter your bills of lading practically under present circumstances?—Yes; we could alter the bills of lading certainly. But could we carry out the alteration as the docks are at present? That is a point which I hold to be exceedingly doubtful; and, in fact, I go further, and say we could not carry it out. We should still be obliged to discharge cargo into lighters.

2066. Then in the matter of light dues, which were so important in the comparison between Antwerp and London, I suppose that London is not any worse than any other port in the United Kingdom?—I fancy it is; I will not be sure about it.

2067. But still, it is a charge of a kind that applies to the ports of the United Kingdom generally, and not merely to London?—Yes.

2068. (Chairman.) Are you satisfied with the buoying of the Thames?—Yes.

2069. As far as Trinity House is concerned, you are satisfied with the work they do?—Yes, I think the Trinity House know their work right well.

See 2144.

2070. (Sir John Wolfe-Barry.) In an answer you gave—I think it is susceptible of misapprehension—you said that if the Thames Conservancy had come to Parliament they would have had a hard time of it. Do you mean that if after the Report of 1896 they had come to Parliament with a well-considered scheme for deepening the river in accordance with demands of shipowners, and in accordance with the recommendations of that Commission, Parliament would not have given them the powers to do it?—I think most likely not.

2071. (Mr. Ellis.) You mean that the House of Commons would have opened up so many questions?—As far as I know it is a body that has not many friends in Parliament. Its constitution is not exactly what you would call a popular constitution.

(Lord Revelstoke at this point took the chair.)

Mr. JAMES GEORGE SKELTON ANDERSON called and examined.

2077. (Lord Revelstoke.) You are the manager of the Orient Steam Navigation Company?—Yes.

2078. You run steamers to Australia?—To and from Australia at intervals of a fortnight.

2079. You are, I think, the chairman of the company?—At present I am.

2080. How long have you been chairman?—There are two firms' managers, and we divide the honours. We take it year about.

2081. And you appear here representing the General Shipowners' Society?—Yes, I also appear here at the request of the committee of the General Shipowners' Society. The statement which I have submitted as my evidence in chief is what I think I can safely say they wish me to say. If I add anything after that, I do not know that it will be in discord with them, but I do not guarantee that everything I say over and above that is as a true spokesman of the General Shipowners' Society, but I shall be a pretty faithful spokesman of the Orient Company in anything I say.

2082. This present evidence you are giving at the request of the Shipowners' Company?—Yes.

2083. Your firm have loaded steamers to Australia since 1875?—Yes; my firm practically started the big steamer trade to Australia.

2084. And you have used in succession different docks?—The South West India Dock, the East India Dock, the Royal Albert Dock, and finally the Tilbury Dock. We went to the Tilbury Dock immediately upon its being opened.

2085. Can you tell us the greatest depth of water on which you can rely at low spring tides in the channel below Gravesend?—In the channel below Gravesend the Thames Conservancy are advised by their experts that we can rely upon 26ft., but I am advised by my experts that we cannot. By "my experts," I mean our commanders and officers and pilots. They say that 25ft. is as much as we can rely upon in some places in the buoyed channel.

See 2154-7.

2086. And some of your steamers, when loaded, draw more than that amount, of course?—Yes. We have sent some away drawing 27ft. 6in., but if there was water enough in the river, I daresay we could load them down to 26ft. 6in., while leaving sufficient free board.

2072. (Sir John Wolfe-Barry.) What you mean is that it would have resolved itself into a reconstitution of the Thames Conservancy under some other name and with some other powers, but you do not mean that Parliament would not have given powers to deepen the river, do you?—A great deal more than that is involved from my point of view. It seems to me that the Thames Conservancy should have charge of the Upper River, and should, of course, have some revenue, some slight toll, from shipping. In order to carry out the necessary work in the Upper River, which provides the water for the Lower River, I do not think it would be reasonable that the Thames Conservancy of the Upper River should be dependent upon the fees that they receive from riparian owners, we will say, in the Upper River. But, granting that, I say that the authority vested with the charge of the Lower River should be an authority with far greater powers than Parliament would ever give to the Thames Conservancy constituted as they now are with powers to borrow money, levy rates, and so on. I do not mean parochial rates; I mean rates upon goods and barges and ships—a different thing altogether. The reason why the Thames Conservancy could not feel very much confidence in coming before Parliament is, in my view, because the Thames Conservancy does not, as a body, command the confidence of those at large who are most deeply interested in the welfare of the Port of London.

Sir T. Sutherland.  
27 Nov. 1900.

2073. You do not mean to infer that Parliament would not have given powers to deepen the river to somebody or other?—No.

2074. (Mr. Ellis.) You speak with the memory of all the discussions respecting the Thames Conservancy in the House of Commons in your mind?—Surely.

2075. And especially the statement that was made on the 10th July, 1894, that this Act must not be regarded as a final settlement of that matter?—Yes.

2076. Which was admitted by Sir Frederick Dixon-Hartland?—Yes.

2087. Will you give us your opinion as to what depth you think should be made in the channel from the sea to Tilbury?—I think 30ft. at low spring tides at least. There are steamers now using the river of deeper draught than 30ft., and no doubt there will be more steamers of a greater draught than 30ft. I may say there are two new steamers, I need not name them, which, I think, are 2ft. more than that. Immediately, I think, 30ft. should be the aim of the authority; and the width of the channel should be at least 1,000 ft.

Mr. J. G. S. Anderson.

2088. That is of greater depth than has yet been mentioned here?—I am not quite clear about that. I rather think the Thames Conservancy think that they have got that width—1,000ft.—and a depth of 26ft; I rather think they claim that. Excuse me, I thought you asked me whether the 1,000ft. was greater than the present width of the channel.

2089. No, I said than anything that has been suggested?—I rather think at present the width of the channel is 1,000ft.; the channel which I am speaking of is claimed to be 26ft. deep, but it is not quite that.

2090. Will you give us your views as to the working of the Tilbury Dock?—Yes. May I say, as I am speaking for the General Shipowners' Society, that it is their wish that the channel above Tilbury Dock should be improved. I heard the evidence of Sir Thomas Sutherland on that point, and I think to the best of my knowledge that he expressed the opinion of shipowners generally. You ask my opinion of the Tilbury Dock. I think very highly of the Tilbury Dock; I think it is a great boon to the Port of London. I feel very sorry for and sympathetic with the poor shareholders whose money was put into it, especially those who have had to sell out, because now its merits are being fully recognised, and it is working to very near its maximum capacity.

See 1992-3.

2091. Will you go on with the evidence, please?—The Tilbury Dock, in comparison with the Royal Albert Dock, suffers from being so far distant from London as to be practically out of carting range. The Albert Dock is within comfortable range for a cart—just about as far as a cart and horse can go. The Tilbury Dock is farther than is convenient for a cart and horse to go. The scheme was that the dock company should provide an ample

Mr. J. G. S.  
Anderson.

27 Nov. 1900.

receiving house in the Commercial Road, and the trains should be run as often as was wanted. But from one cause or another that has not been carried out, and the Tilbury Dock does suffer from the length of time that it sometimes takes to get goods to the ship from the receiving house. I have known, or it has been reported to me, of goods wanted to fill up a ship being despatched at 7 o'clock at night from the receiving house, and the train not getting alongside the ship till 4 o'clock on the following morning. The congestion in the railway traffic occurs somewhere about Stepney Station. The line wants widening; that is where the neck of the bottle is. At Tilbury Dock there are, no doubt, berths occasionally vacant, and sometimes for a day or two the dock looks almost empty, but frequently it is quite full. I rather think from my observation, and from what I hear, that it would be difficult for the dock company to allot regular berths for any other lines than those at present using the dock. To the best of my knowledge, derived not so much from personal observation as in the case of the Tilbury Dock, but from reports of my officials and others with whom I am associated in business, it is just as difficult to get a loading berth in the other docks in London; in fact the dock capacity of London seems to be working pretty nearly, if not quite, up to its maximum. The tendency at present of the shipping trade of this country is to discard sailing ships in favour of steamers, and for long distance trades especially, to increase the size of steamers. Even for the short distance trades the size of the steamers is being increased as much as circumstances will permit, but for the long distance trades there is a very marked tendency to largely increase the size of steamers. I think it is very desirable in the interest of the Port of London—I am not speaking of shipowners, I am speaking of the metropolitan area, of the business and the commerce of the place—that London should be able to take in this new traffic. To my mind the most likely place to accommodate it is Tilbury. I think there should be additional docks at Tilbury with a new entrance a little higher up than the present entrance, if, as I have been told by some experts, that position should on investigation be approved for an opening. The present opening is liable to slit up with mud; I am told if an opening a little higher up round the Nees were made, it would be kept clear by natural scour; and the currents, such as they are there, would favour docking at times of the tide when docking is very difficult with the present opening. At Tilbury it is to be noted that goods are not warehoused; there are not, properly speaking, warehouses there for the storage of goods; there are merely sheds for temporary shelter of goods while they are being sorted out and moved away to their destinations, whether they go by water or whether they go by railway, and whether they go to London or into the Midlands, or wherever they go. I think that any new docks there would be of the same character, that is to say, merely a place for the safe reception of the ships and the transfer of their cargoes.

2092. Do you say that the Port of London has become unattractive by reason of the detention and the charges?—Yes. I am not prepared to say very positively that all the charges are higher, in fact I think some of the charges of the Port of London are not higher than the charges in other places. I have tried to get satisfactory statements of figures to compare the charges in London with the charges of other competing ports, but I scarcely think that the few I have been able to get are conclusive enough to be worth handing in.

2093. But you say so here in your statement?—What I do say is, that the detention of London is to my knowledge greater than the detention of other ports, and of course time is money. 4d. per registered ton per day is the usual demurrage for a steamer with crew on board; it may easily be understood that if a vessel is detained ten days longer at London than she would be at Antwerp, it is a very serious thing. I am also able to say that the wages of London are higher than in most of the competing ports, if not all; and that the working men in London are more difficult to handle; they are more apt to strike; and the pilotage also, I am able to state, is distinctly higher than in most of the competing ports.

2094. Without taking any particular item, do you suggest that from a shipowner's point of view London is a dearer port than others?—Yes, I do. Part of my business is that of a chartering broker. We charter a considerable amount of tonnage every year to the order of clients mostly. For instance, for one particular client

we charter about 400,000 tons a year, and we charter to all parts of the United Kingdom and to the Continent, besides other places. What we find is that most of the owners will try to avoid London; they will want to be paid more if they are to come to London; they will certainly prefer an open charter, which gives them the chance of not coming to London, rather than a charter where there is the option of sending the ship to London direct.

2095. You have told us just now that London was a dearer port than others. Will you tell us in respect of what particular items such is the case?—I tried to guard myself against dealing with that, because beyond the pilotage and detention and labour, I am not quite sure that I could make out the case for London being dearer.

2096. Therefore when you say London is a more expensive port, you do not care to go on?—No; I do not lay great stress upon it except in these matters.

2097. You would rather lean more on the detention than on the expense?—Yes; I lean more on the detention—and the wages—of course we cannot help that.

2098. But wages are part of the expense?—Yes, but the wages are higher in London.

2099. Well, you must take one item with another, must you not?—The ships that are willing to come to London are ships that expect to get cargoes from London; and if they do not expect to get cargoes from London they do not wish to come to London, and they try to avoid it.

2100. You do not put particular stress upon London being a more expensive port than others?—I do not do so in the sense of something being required to be done by a public authority to lower the charges to ships, except with regard to pilotage, because I am not able to put my finger on anything of the kind.

2101. (Sir Robert Giffen.) What do you say about light dues that Sir Thomas Sutherland mentioned in comparison with Antwerp?—I agree with most that Sir Thomas Sutherland said, but when he said that Turkey was the only power that charged light dues, I know that has been said and it caught on, but it unfortunately is only true on the surface, because other powers do charge light dues, though under different names. See 2020.

2102. Is there anything else at Antwerp?—I have compared the expense of Antwerp with the expense of London—not in ships belonging to myself; I have not had a ship belonging to myself there; but I have applied for figures right and left. My replies have generally been vague and unsupported by figures, but the figures which I have got do not show much more than that the wages are lighter and the pilotage is lighter than in London, and there is less detention.

2103. And the detention is very serious in London?—And the detention is much less in Antwerp. The workmen are less bristling with independence than they are here. That is what I am told. The workmen here will turn up the job and go away if anything is said that they do not like.

2104. (Lord Revelstoke.) Will you give us your ideas as to what should be done as to administration?—I generally agree with what Sir Thomas Sutherland said, that what is wanted is a public authority to take over and administer the whole system of docks and waterways of the Port of London, as has been, I believe, successfully done in the Mersey and elsewhere. How that public authority should be constituted, of course, is a rather difficult question. Sir Thomas Sutherland said it must be an authority constituted *ad hoc*. I agree with that up to a certain point, but before I come to consider what the composition of that authority ought to be, I would like to consider first the sources from which the necessary revenue would be derived. I think, to begin with, that the charges on the ships should be continued for the moment as at present, with one exception that I will mention presently. The dock companies at present have power to charge the ships 1s. 6d. per ton on the net register for the use of the docks for 28 days. They only charge 1s.; they have not thought it wise to use their powers of charging beyond that. I think they have exercised a very wise discretion in that matter, because although I have not been able to say to the Commission that the charges of the Port of London in these respects are heavier than the charges of the competing ports, they are certainly at least as heavy. For that reason I think the dock companies have exercised a wise discretion in not charging the ships more than 1s. But I think that the dock companies have been very unfortunately placed in not being able to make a charge

See 2005-8.

on all goods using the docks. Up to the time when the East and West India Docks were started, which is about 100 years ago, the ships using the Port of London had, as you no doubt know, been discharged and loaded in the river. It was thought that it would be possible for them to go on doing so; it was not foreseen that the size of ships would grow so rapidly, but the size of ships has grown so much that practically all the ships coming to London must have the docks to go into, and without these docks the trade could not be carried on, and without deeper waterways the modern class of ship cannot use London; and without better waterways, and the waterways being maintained, the existing kind of ships cannot use London. I think, altogether, that the best way to raise the revenue is by charging the ships as at present, but grading the charge so that if a ship goes away in a week she does not pay so much as a ship that leaves in a fortnight, and the fortnight ship not so much as one that leaves in 28 days; but subject to that, I should continue very much the same charge upon the ships. See 2009. I would impose a charge upon all the goods, as Sir Thomas Sutherland, I think, recommended. Those charges, both on ships and on cargo, will have to be limited by considerations of policy; whereas the interest upon the capital invested under this public trust would have to be paid whether trade was good or trade was bad. There would be no question of policy about that. In order to get money cheaply to begin with and to go on with, the interest must be assured; it must be practically as good as Consols; it might make a difference of  $\frac{1}{4}$  or  $\frac{1}{2}$  per cent.

2105. I daresay you understand our wish. We came to the conclusion that we would not go into this question as to how the funds were to be raised for the moment?—I have so nearly done that perhaps you will allow me to finish my argument.

2106. Very well?—These considerations have led me to the conclusion that behind the charges upon the ships and upon the goods there must be the guarantee of the rates of the metropolitan area, and that points to the London County Council being the main authority on the subject. Now, I know that the general feeling among the shipowners—it may be a superficial one, it was my feeling until I began to think the thing out after I had been asked to give evidence here—is that the London County Council had got enough in their hands, and it would be better not to put the care of the river waterways and docks in their hands, any more than to put the School Board in their hands; but I have come to the conclusion that to do this thing economically we must have the rates of London at the back of the trust, and in that case the County Council must be the main authority. But the administration, I think, should be committed to a sub-committee of the Council; that is what I suggest, at all events.

2107. (Mr. Ellis.) Let us clearly understand this. Are you speaking now on behalf of the Shipowners' Society, or as an individual?—I am speaking at this moment as an individual who has consulted with other shipowners, who have agreed, but I am not speaking now for the General Shipowners' Society.

2108. (Sir Robert Giffen.) Does the Shipowners' Society agree with Sir Thomas Sutherland in this matter?—Yes, in the substance of what he said; he was present at the meeting.

2109. (Mr. Ellis.) He did not go so much into detail?—No; I think the administration of this work would have to be committed to a sub-committee of the London County Council.

2110. (Sir Robert Giffen.) Of course, you are speaking quite generally upon matters of policy now, without reference to any question as to what the claims of the dock companies may be, or the wharfingers, or any other bodies that may have to be dealt with?—Quite so; I am speaking in the case of a public trust, as to how it strikes me the authority should be constituted. I think that with this sub-committee of the London County Council there should be an instruction to them to associate with themselves a certain number of representatives of the commercial interests concerned in the Port of London having expert knowledge. All schemes involving the spending of money would have to be submitted, and passed by the London County Council as representing the ratepayers.

2111. (Mr. Ellis.) The County Council representatives are coming next week to give evidence?—I am sorry if I have gone beyond my last. I really spoke

about this because it was one of the points that the General Shipowners' Society wish cleared up; but since I have hammered it out with my ship-owning friends privately, I have not had a meeting of the General Shipowners' Society, so I have not been able to speak to them. You will remember that the time has been very short; I have only had two or three days.

2112. (Lord Revelstoke.) To go back to a part of your earlier evidence. Do you undertake the discharge of your own ships?—Hitherto the dock company has done that. I think we are in a transition stage just now.

2113. What is the case at present?—The dock company still continue, but they wish us to relieve them of it.

2114. But they actually do it at the moment?—Yes, they do it at the moment.

2115. I was thinking of the question of rapid discharge on which Sir Thomas Sutherland laid considerable stress. See 1972 and 1997. Do you think it would accelerate the discharge of ships if the shipowners chose to make it a condition that there should be no discharging overside?—No, I do not. In many cases it would, but large portions of our cargoes do not require to be sorted, and can be sent overside at once. As I have told you, Tilbury Dock does not warehouse goods, and most of our cargoes go to the wharves and go by barge. The barges are very large; they run up to 300 tons apiece; they are as big as some ocean-going ships used to be at the beginning of the century. They have of their own accord ceased to drift about with the tides. A lot of empty barges come down, about a dozen, in tow of one little tug, and they are dropped and a corresponding number of full barges taken back on the next tide. That is how it is managed.

2116. When it comes to the question of barges I suppose the dock companies suffer the same inconvenience as you do?—The dock companies wish to be able to charge the barges, because in opening their gates to let the barges in and out they admit a lot of mud, and it costs them money to deal with that; and they do not like the barges drifting about in their docks all the time. I am quite of opinion that the barge use of the docks possibly requires to be regulated in some way to prevent abuses, but I think it would be a very great pity if it was thought necessary to deprive the lighters of free use of the docks; I think some way could be found round that to satisfy the dock companies. It must be remembered that while the dock companies are put to some expense in clearing away the mud that comes into their docks in admitting these barges, they are also put to expense to maintain the roadways for the land removal of cargo. If a public trust were created, a public authority to take over the docks, that authority must be absolutely impartial between the land-borne goods and the water-borne goods. Against the mud which the dock company have to remove there is on the other side the cost of keeping the roads on the landward side.

2117. (Sir Robert Giffen.) To keep to the actual fact for one moment, you say, as a matter of fact, that your business in Tilbury Dock could not be carried on without the barges?—I think I might go that length certainly.

2118. The railway communication to the Commercial Road is not quite sufficient; you want to have the barges as well?—It would be impossible to carry on our business without barges. The lighter traffic of London is one of its great features. Of course, London differs from most other ports in that respect. At Liverpool the docks are in the town, but the docks of London, except the very old ones, are not in the town, and the goods must have the cheapest conveyance.

2119. Are not docks like the London Docks, the St. Katharine Dock, the Millwall Dock, and the Surrey Commercial Dock, very much in town?—Yes, those are very much in town.

2120. So that Tilbury Dock is an extreme case of lighterage being necessary to the business of the shipowners who come there?—It is nearly equally necessary in the Royal Albert Dock, I should think, and the Victoria Dock, and probably also in the East and West India Docks—not quite so much so, because they have storage.

2121. Tilbury Dock is an extreme case where there is absolutely no means of accommodating the customers except to have lighterage?—We could not carry on our business at Tilbury without the lighters.

2122. (Rear-Admiral Hext.) At present?—At present; and not at any time in future that we could foresee.

2123. (Sir Robert Giffen.) There are not likely to be means of accommodating the traffic by railways at Til-

*Mr. J. G. S. Anderson.* bury Dock?—There are no means at present. I do not see how the railway could compete with the lighters for the wharves upon the banks of the Thames higher up. 27 Nov. 1900. I do not see how it ever could possibly compete.

2124. Can you tell us the expense of lightering up to London Bridge as compared with the expense of sending goods by railway up to Commercial Road?—I am afraid I have not got figures, but it would be very much less. I could let you have figures, I daresay. From 26 steamers running in the Orient Line I could easily give you the figures, but I have not got that here. It is a thing that is never done; it is out of the question.

2125. Perhaps we shall get that from the wharfingers? Yes. From our steamers running in the Orient Mail Line last year we landed on the docks, for the purpose of sorting, 18,000 tons. These are goods not to be transmitted anywhere by land, but simply landed for the purpose of sorting because they get all mixed, and it is necessary to land them for the purpose of sorting. We landed last year 18,000 tons. I do not know whether you would like to know what the average cost of landing and sorting was which the shipowner paid.

2126. Yes?—The prices vary according to the goods. Perhaps the highest price the dock company charge is 2s. 6d. for landing and sorting, and some kinds of goods go down to about 1s. The average cost of landing and sorting was 1s. 10d. a ton.

2127. This is what the dock company does for you?—The dock company does this for us, and in our case the shipowner paid. I submit that the cost of sorting should be paid by the goods in any scheme in future, and that the cost of landing might be borne by the ship; but the cost of putting into the lighter should be borne by the goods to put the water-borne goods on equality with land goods. And I think that the ship should land or deliver overside all the goods, and there the ship's duty should end, as at Liverpool. Then sorting should be borne by the owner of the goods, and paid to the dock company, and the handling of the goods afterwards, putting them into barges or putting them on to railway trucks should be borne by the owner of the goods.

2128. Would you have to alter the bills of lading to do that?—I think it would be best done by an Act of Parliament, if there was an Act of Parliament in this case. The bills of lading could only be altered in trades where the ships are able to combine for the purpose.

2129. They have been altered in some trades, have they not?—They have been altered in some trades the conditions of which permit of the shipowners combining, but in trades where the shipowners cannot combine—and there are trades where the conditions of competition are such as to make it impossible for them to combine—if that inequality as between land-borne and water-borne goods is to be redressed it can only be done as part of a settlement of this sort.

2130. Does it not seem a very strong measure to have Parliament called in to interfere between different classes of traders, shipowners, and merchants and wharfingers?—This is a question of who is to bear the necessary expense of the docks.

2131. But is not that a question that you might expect people in business to settle for themselves?—It has been settled for them so far by Parliament. The relations between the docks and the merchants have been regulated by Act of Parliament, and so have those of the docks and the lightermen. I think it is very desirable that Parliament should continue to regulate these relations, because they are relations of monopoly, and it is of great importance to the public interest of London that they should be regulated.

2132. Is there not a difficulty in the matter, that Parliament might make some regulations which the trade would not follow? You have to consider carefully what the trade requires and what it does?—Yes, I quite think so. I am not putting forward anything as a cut and dried scheme. There must be many minds at it, and I presume Parliament would only act after reports with which it was satisfied.

2133. But the trade may go its own way after all, whatever Parliament may say?—If the docks of London are a monopoly secured by an Act of Parliament, the trade, if it is coming to London, must use these docks.

2134. You can fix the dock charges that they may make by Parliament, but when it comes to a question of handling goods, is not that rather beyond the

function of an Act of Parliament?—Well, let us put it by for the present. There was something on this subject in Sir Thomas Sutherland's evidence; that was why I brought it up. I should be anxious that this public trust should be perfectly impartial and even as between the wharves and any other interest whatsoever.

2135. But you have not any plan to put before us as to how the trust is to be created, first of all, separating and dealing with all the private interests involved; and then whether it is to be a warehouse trust as well as a dock trust?—Of course, some of the existing docks have warehouses. That is a fact that has to be taken into account by all the interests, whether conflicting or otherwise. We cannot alter facts. With regard to any addition to the docking accommodation of the Port of London, so far as I can see it would be most unlikely that warehouses would form part of the scheme of this public trust. A public authority acting in the interest of the port only would not have the temptation of going into competition with existing docks or warehouses.

2136. Sir Thomas Sutherland was doubtful whether the trust would embrace wharves or not?—I know he dropped a suggestion on that point. It would, I think, be an unnecessary doubling of the magnitude of the operation, and I think that the care of these interests of the merchants and goods is best left to the competition of the wharfingers. See 2061.

2137. You have not formulated any plan in detail?—Not further than what I have indicated. I think with such guarantees for the regular payment of the interest upon the securities there would not be much difficulty in getting the money that might be necessary at a low rate of interest. Most of the present investors would probably be glad to take the new securities in place of the present ones. It would amount to something like a reconstruction of a public company, a process which is familiar to most of us; those who object to taking the new securities in place of the old would have the right to be paid off, by arbitration, if the parties could not agree. What the basis of the valuation of this property should be I would rather not enter upon.

2138. (*Rear-Admiral Hext.*) You say that you think that if any additional dock space is provided it should be at Tilbury?—Immediately, to begin with, I think I said.

2139. In saying that, do you take into consideration that if the river was deepened as far as the Albert Docks to the 26ft. with a channel of 500ft. wide, would it not be better for the trade to go nearer London, and the extension to take place there, at the Albert Docks instead of at Tilbury?—Apparently the Albert Docks has suited very well the ships of the draught used by certain companies, particularly such companies as the P. and O. Company and the British India Company, of which Sir Thomas Sutherland spoke. But I think, owing to the depth of water in certain ports that they wish their ships to be able to go to, they do not go to very deep draughts.

2140. But I say, supposing the river was deepened as suggested to 26ft. and with a width of 500ft. as far as the Albert Docks, would not that make you modify your opinion, when you consider the Albert Docks are so much nearer London than the Tilbury Docks?—I have advocated deepening the channel as far as Tilbury to 30ft. for deep water ships. I think Sir Thomas Sutherland, if I caught what he said rightly, gave cases in which his ships had to turn back and go back to Gravesend. Well, for large traffic Tilbury is the place. See 1992.

2141. The channel is not deepened at present, that is the reason the ships had to be turned back. If the channel were deepened to that depth, 26ft. at low water?—I am quite in favour of deepening the channel, and I believe the Royal Albert Dock people have a scheme for making new docks between their present docks and the river. And I should think probably it would be a very good thing, but it would not cause me to modify my opinion; at least it does not at present—that to secure the big ship traffic and get the share of it for London that we ought to have, we want additional dock space at Tilbury.

2142. We are not talking entirely of big ships; we are talking of London, and I understand you to say you advocate a dock extension at Tilbury in preference to a dock extension at the Albert Dock. That is what I want to arrive at?—I think to secure the large traffic,

having regard to the whole traffic of London, new docks up there would be very desirable, the present ones being full because they are within carting distance.

2143. Then you said the present docks at Tilbury are without warehouses. Of course we know that. But supposing warehouses existed, would you like to see the American bill of lading substituted for the present and all goods loaded on to the wharf and there sorted, or not; or would you prefer the present system?—I am not familiar with the American bill of lading. I do not know that I have seen it, but I have been told that they have managed to introduce into the bill of lading contract a stipulation casting upon the owner of the goods the cost of sorting. I think that is a most righteous thing. I think the owner of the goods should pay the cost of sorting.

See 1968  
74.

2144. Sir Thomas Sutherland told us, too, that he thought a continuation of the wharves in deep water would, in a great measure, take the place of docks. Do you agree with that opinion?—Sir Thomas Sutherland is a great authority on these subjects; he has seen arrangements of that sort abroad, I believe, but I have spoken to pilots about it, and people who know the river well, and they do not think it is a practical thing. The best advice I have been able to get upon it is that in our river it would interfere too much with the channel.

2145. It is certainly practicable in the Thames; pilots always make objections?—I scarcely think I know enough to give evidence on that subject. I can only tell you what I have been told. It would be easy to send an experienced man—there are pilots here who know the river well—to give evidence.

2146. Just now you said that no tax should be put on the lighters. You thought the river and docks should be free to the lighters?—Yes.

2147. Which, in your opinion, would be the most convenient for lighters: to unload the vessel or load the vessel, in the Thames River or in the docks?—Certainly in the docks.

2148. Therefore they get that advantage for nothing?—They get that advantage for nothing; and the carts—they come into the docks and get that advantage for nothing.

2149. But the lighters must gain a great advantage in loading or unloading a vessel in still water with no current over doing so in a rapid river?—Certainly; there is no doubt about that.

2150. They may also, I presume, gain time by not having to cast off sometimes and come on again in the river?—Certainly; the trade could not go on in the river.

2151. (*Mr. Ellis.*) How many steamers has your company?—We have 9 steamers running in the line, and we have one spare steamer.

2152. That is your fleet?—Yes. I am speaking of the Orient Line.

2153. What is the tonnage?—About 60,000 tons.

See 2085.

2154. Then, turning to the matter of depth. I rather gather from you—I think your phrase was that the experts of the Thames Conservancy gave you depths, but your experts gave you other depths. Is that so?—Yes, the Thames Conservancy, as I understand it, are advised by their engineer that there is a channel 1,000ft. wide and 26ft. deep, at low spring tides, from

Tilbury to the sea, and our pilots say that they cannot count on more than 25ft. in places, and that is the opinion of their brother pilots in Gravesend. *Mr. J. G. S. Anderson.*

27 Nov. 1900.

2155. Are we to take it from you, the Orient Company do not feel safe in relying upon information that is supplied to you, as to the depths of the River Thames, by the Thames Conservancy?—I do not wish to put it offensively, but our people require Admiralty charts to go by, or the information of their pilots. Of course, they move by the lead, and the pilots say they cannot count on more than 25ft. at certain times of the tide. See 7546.

2156. May I put it this way, that those on whom you rely inform you that the information of the public authority, or whatever it may be, is not to be relied upon as a safe thing for your ships?—They take too rosy a view of what they have effected by their dredging.

2157. That is another point. I want to stick to the point for a moment. Do you, as the manager of the Orient Company, come before us and tell us that your pilots inform you that your ships cannot safely be navigated on information supplied to you by the authority of the River Thames?—It amounts to that, certainly.

2158. Then, with regard to Tilbury, I just want to clear up that point. I understand you to say that it is rather beyond the carting distance, and that there is a bottle neck. Am I to take it from you that if the railway was improved, if there was ample railway accommodation between Tilbury and, I think, it is called the Commercial Warehouse, is it not?—Commercial Road Warehouse. It is a large receiving house. See 2091.

2159. Erected in 1887?—Yes.

2160. Am I to take it from you that if the railway communication was perfect, we will say, between Tilbury and the Commercial Road warehouse, from a shipowner's point of view that would be perfectly satisfactory?—At present there is no doubt that Tilbury has advantages in some ways, but the Royal Albert Dock has the advantage over Tilbury that carts can get to it. It is a matter of opinion what would be the result of a very good railway communication, frequent and rapid. The goods should come down in an hour. Though London merchants are very conservative and slow to change, if they once got into the way of sending goods to this receiving house and having them alongside the ship in an hour, I think they would forget the preference for carting; but certainly at present they do have a preference for carting, and that stands in the way of the user of Tilbury Dock for vessels in an ordinary way other than mail steamers, which do not carry very much cargo, and which attract cargo by the special advantage which they offer. Albert Docks have an attraction in the way I have indicated. I would like to say that in the future I do not know what changes there will be, but perhaps these docks down the river will not be dependent entirely on the rail; there may be automotor arrangements, or we do not know what, but there is no doubt that Tilbury Docks have a great attraction to big ships *qua* such, and to lines that want to run a regular service with the smallest number of expensive steamers, because they are away from a number of dangers, they are 14 miles down the river from the Royal Albert Dock, and they can get into safety almost at once. They have a better chance to get away if a fog lifts. So there are two sides to the case.

2161. Your answer is really this: it is not only the rapid transit of goods that has to be considered, but there is a certain element of prejudice in favour of cartage. Is that so?—I think so.

Mr. ALFRED STROVER WILLIAMS called and examined.

2162. (*Lord Revelstoke.*) You are director, I think, of the Atlantic Transport and National Steamship Companies?—Yes, that is so.

2163. You come here at the request of the Committee of the General Shipowners' Society?—Yes.

2164. Do you give your evidence at their request?—Yes.

2165. Will you please proceed with it?—I have given consideration to the subject and the present condition of the Port of London, and I have come to the conclusion that that condition requires to be amended, and that the formation of a harbour trust of a character similar to that created in Liverpool should be carried out. The present dock accommodation for vessels of large size is insufficient, while the river approach to the docks, and particularly to the westward of the Medway, is so in-

adequately dredged that vessels are constantly compelled to drop anchor at or near the Nore to await the flow of the tide to enable them to proceed to dock. I will now hand in a statement of delays from this cause which have occurred since the 1st of May last to the large vessels of our company.

*Mr. A. S. Williams.*

(*The Witness handed in a statement of steamers of the Atlantic Transport Company and the National Steamship Company compelled to anchor in the neighbourhood of the Nore during the year 1900 on account of deficient draught of water. See Appendix, 6th Day, No. 3.*)

I produce a copy of a letter from the Thames Conservancy addressed to the Atlantic Transport Company regarding the grounding of our s.s. "Minneapolis" in which they practically threaten the owners of the steamer with penalties for getting aground in the necessary effort made by the pilot in charge to avoid a collision. I will

*Mrs. A. S. Williams.* read the letter, if the Commissioners will allow me, aloud.

2166. Yes, please do so?—"Thames Conservancy, Victoria Embankment, August 20th, 1900. Gentlemen,—When your steamer 'Minneapolis' recently grounded at the entrance to Hole Haven Creek, she threw up a bank about 5ft. high, which is a danger to small craft, and will have to be removed. Our engineer proposes to carry out this work, and I shall be glad to hear that you concur in this course. The amount of the cost incurred will be sent to you later on.—I am, gentlemen, your obedient servant, R. Philipson (Secretary)."

2167. Has this matter been carried any further?—No.

2168. Have you heard any further from the Thames Conservancy?—Nothing further.

2169. Did you reply to that letter?—We replied and told them we placed it in the hands of our solicitor. We denied any liability they sought to throw upon us, and we put it in the hands of our solicitor. Since then we have heard nothing.

2170. We ought to have had your reply, I think?—I will send it in.\* I advocate the formation of a trust to undertake the care of the river and docks, etc., of the Port of London, for the reason that, if properly constituted, it could be entrusted with powers to raise necessary funds which would not be entrusted to either the dock companies or the Thames Conservancy under the present circumstances. I see no reason why barges using the various docks should not pay reasonable dues for such use, and I desire to see powers entrusted to a properly-constituted authority to levy dues on goods brought in for consumption in the port. All transshipment or entrepôt goods should, however, be free. An efficient trust should, *inter alia*, (A) increase the present dock accommodation; (B) dredge the river westward of the Nore so as to give a deeper and wider channel from the Nore to Tilbury, and thence to the Royal Albert Docks; (C) remove the Foreign Cattle Market from Deptford to a point below Gravesend; (D) assume the power at present exercised by the Watermen's Company, unless, which is preferable, the licensing of watermen be abolished and the river be thrown open. If vessels could be relied upon to go and come with absolute punctuality, the present accommodation of the port would meet the present requirements, but there can be no such reliance. Two or more vessels timed to arrive and discharge with a convenient interval between them may arrive at the same time, with unfortunate results in delay of the vessels themselves and delay in delivery of the cargo they discharge. All North Atlantic general cargo, except grain, is discharged on to quay, and is delivered thence to merchants' craft when the importing steamer leaves the quay. Should a second vessel be placed at such quay to discharge before the first cargo has been delivered, great confusion, expense, and delay arise. The river should be dredged, so as to give a wider and deeper channel westward of the Nore. With vessels of over 600ft. in length, and a draught of 33ft., the present channel, alleged to be of 1,000ft., with a depth of 26ft. at low water, is not adequate. A vessel of the size stated, if she has to deflect but slightly from her course in order to avoid collision, gets aground. To prevent the silting up of the river, the sludge steamers of the London County Council should be compelled to discharge their contents in the Barrow Deepes earlier on the tide than they do at present. I am informed by our pilots that, coming down with the ebb tide, the sludge steamers only arrive at their dumping ground on slack water, so that instead of the sludge being swept out to sea by the ebb tide, it is brought up by the flood tide, and is likely in time to seriously affect the condition of the channels. The Foreign Cattle Market is out of place at Deptford. In earlier days, when its trade consisted

of cattle brought from the Continent of Europe by small vessels, its locality was not objectionable. Now the trade has completely altered, and consists almost exclusively of cattle from the Northern States of America and Canada. These cattle are carried with the least possible suffering in steamers of such size that a yearly-increasing number of them cannot go to Deptford, the consequences being that the beasts have to be transhipped at Gravesend, with some suffering and inconvenience, and at a cost of 2s. per head. This cost to the two companies I represent amounted in 1899 to £4,262. The total cost of transshipping beasts for the present year will in all probability amount to £9,000 or £10,000. Where cattle-carrying steamers can deliver their beasts direct to Deptford, much difficulty, risk, and delay occur, the vessel frequently losing one or two tides in proceeding to Deptford and returning thence back to dock. I have here a letter from the Chesapeake and Ohio Steamship Co., dated the 14th inst., on this subject, which I will read: "Chesapeake and Ohio Steamship Co., Ltd., 4 Fenchurch Avenue, London, E.C., 14th November, 1900. Messrs. The Atlantic Transport Co., 108 Fenchurch Street, E.C. Dear Sirs,—In reply to your letter of the 13th, re number of cattle that we have carried last year and the first nine months of this, we are afraid that this information will not be of much use to you with reference to the object for which you require it, as all our steamers are of such a size that they are enabled to go to the Cattle Market at Deptford, and all our cattle have been landed there. At the same time we have often lost the tide by having to go up to the Deptford Cattle Market and back to dock. Steamers for Deptford cannot leave Gravesend until about one or two hours before flood tide; this just gives them time to go to Deptford, land their cattle, and get back to dock. Should they arrive at Gravesend only two or three hours before high water, they are too late to get to Deptford and back, and consequently lose 12 hours at anchor in the river, and sometimes 24 hours. The pilots invariably refuse to take them up to Deptford on the night tide, excepting the night is exceptionally fine. It is therefore of great importance to shipowners that the Foreign Cattle Wharf should be at a more accessible point lower down the river, London being at a greater disadvantage than any other port in the United Kingdom in respect to the position of its Foreign Animal Wharf. Yours truly, Chesapeake and Ohio Steamship Co., Ltd. W. N. Diggins, Secretary." The possession by the watermen of the Thames of the exclusive right of navigating barges on the river puts into the hands of these men the power of blocking the trade of the port, and should be withdrawn. At the present moment quays and sheds are choked, and steamers are refusing certain cargo for London, for the reason that it cannot be disposed of. I will now hand in a Table of the steamers of the Atlantic Transport Company and the National Steamship Company which I represent, giving their respective length, breadth, depth, deadweight, cubic capacity and load draught. (See Appendix, 6th day, No. 4.) From that Table it will be seen that two of these steamers, the "Minneapolis" and the "Minnehaha" are each 600-7ft. long, 65-5ft. broad, and 39-5ft. deep, with a register tonnage of upwards of 13,400 tons gross.

2171. Will you tell us between London and what ports you trade?—New York, Philadelphia, and Baltimore.

2172. Do you use the docks?—Yes.

2173. Which?—Tilbury for the larger vessels; the Royal Albert Dock and the West India Dock.

2174. Do you discharge in the stream?—No; never in the stream.

2175. Do you find that the London custom entitling consignors to deliver into barge at the ship's expense entails a heavy charge upon the shipowner either in delay to his ship by delivery direct from the ship, or in expense in landing the goods to expedite the discharge?—Yes. On that account what is called the "London Landing Clause" was introduced into our bills of lading some years ago.

2176. That is something peculiar to your trade?—To the North Atlantic trade.

2177. To what we may call the western trade?—Yes.

2178. It is a clause which the P. and O. and the British and India have not got?—No.

2179. You find it of great advantage?—Yes.

\*The witness subsequently forwarded to the Commissioners a copy of the reply, which was as follows:—"London, 22nd August, 1900. To the Secretary, Thames Conservancy, Victoria Embankment, E.C. Dear sir,—'Minneapolis' damage to river bed at Hole Haven Creek:—The Atlantic Transport Company have sent on to us your letter of 20th inst. The grounding in question did not result from any neglect on the part of those in charge of the steamer, but anyhow she was at the time compulsorily in charge of a duly licensed Trinity pilot, whose orders were duly obeyed. We must, therefore, decline liability. Yours truly, John Holman and Sons, Managers."

2180. The custom to which I have alluded is one over which the dock companies have no control?—No.

2181. And from which they derive no benefit?—None at all.

2182. (*Mr. Ellis.*) I gather that your evidence with regard to the trust is from your own individual experience?—Yes, that is so. It is generally held by the Shipowners' Society.

2183. Do you wish to lay it before us as with other authority than your own?—No, except that, as I say, it is generally the view adopted by the General Shipowners' Society.

2184. We have to be rather careful in these Commissions. Do I understand you are authorised by any other body or persons to say it is their view?—No. It had better be taken as coming from myself alone.

2185. There is a serious statement which you make as to sludge steamers. Have you ever made any representation to the Thames Conservancy about that?—No.

2186. It is a correct statement, is it?—It is a statement made on the authority of our pilots—not from my own knowledge.

2187. (*Rear-Admiral Hext.*) Have you any experience of discharging alongside wharves in contradistinction to going into docks?—No, except that we have had some steamers going into Antwerp some years ago. I have some experience of that, but it is very small.

2188. With reference to the question I asked just now about the extension of any docks, which would you prefer, Tilbury or the Albert Dock?—I think both would bear extension. I think the trade would bear extension of both.

2189. If you had your choice of one, which would you advocate in the interests of the port?—I should say, in the interests of the port, the Royal Albert first, but the other would have to follow very quickly.

2190. With reference to the question of barges:—You are quite clear that in your opinion they should pay some reasonable dues for the advantage which they receive from going into the docks?—I think it is reasonable that they should pay a moderate charge.

2191. Do you think that the proposal to deepen the approach to the Tilbury Docks to 30ft., with a width of 1,000ft., would meet your requirements?—Yes, but we should be glad to have more if we could.

2192. Shipowners would be glad to have 40ft. probably, but 30ft. would be sufficient?—Yes. As I remarked, our boats occasionally draw over 30ft.

2193. I see that your maximum draught is 31ft. 6in.?  
—Yes.

2194. Would you, if you had the depth of water, load to a deeper depth than that?—We should occasionally load deeper.

2195. What would be your maximum draught with your existing ships?—The load line of the vessels is 33ft. 2in., but as the vessel is never on an even keel we might be drawing 34ft. or 35ft.

2196. And, as a shipowner, you prefer the American bill of lading method of discharging cargo to the method at present in use in the Port of London?—Distinctly.

2197. (*Sir Robert Giffen.*) Can you give us any experience of the results of the American bill of lading method? Does it diminish the employment of lighters?—I do not think so at all.

2198. It is merely a method of relieving the shipowners to some extent?—To some extent. It gives the lightermen a little longer time to come and collect the goods. That is all. They have that advantage. It gives them 72 hours instead of 24 in which to come and claim delivery of the goods.

2199. With regard to goods coming into Tilbury Docks, do you make use of the railway at all?—Considerable use, but all grain has to go away by lighter. We carry large quantities of grain.

2200. That all goes by lighter?—Yes.

2201. Is that from the nature of the business?—Yes. There is no accommodation for it by rail.

2202. So that at Tilbury you must make use of the lighters?—We must make use of the lighters at Tilbury for grain.

2203. Then with regard to the Deptford Cattle Market, have you been in correspondence with the Agricultural Department of the Government in order to change it?—No.

2204. An Act of Parliament would be necessary, I suppose?—It would take a very large movement indeed to move that, but it wants doing.

2205. But you have not communicated with the Agricultural Department about it?—No.

Mr. CHARLES EDWARD BRIGHTMAN called and examined.

2206. (*Lord Revelstoke.*) You are a partner in the firm of Turner, Brightman, and Co., shipowners and brokers, of 8 and 9, Great St. Helen's, E.C.?—Yes.

2207. You are a member of the committee of the General Shipowners' Society, and you come here to give evidence at the request of the Committee?—Yes.

2208. Will you kindly proceed with it?—I should say that I come here especially with regard to the wood and the grain trades and representing merely cargo steamers. I have been engaged in business since 1871. My firm charter a large number of steamers for sawn wood goods, and have some of its own steamers employed in the trade. Steamers trading from the Baltic and White Sea do so from about May to November, and practically the whole of it that comes, so far as complete cargoes are concerned, to London, is discharged in the Surrey Commercial Docks. A few cargoes are discharged in the river, and some of the other docks, but they are few. A very large percentage of the trade—probably half—is done by barging the goods from the docks, and about half, I should think, is landed. In the early days of wood-carrying by steamers it went entirely on to the quay, and in those days they would receive at the rate of about 250 standards per day at a less cost for discharging than we pay now, and then there was only one consignee. Now a large proportion goes overside and perhaps for 40 receivers, each of whose goods have to be discharged separately, and some of the bills of lading are made out for as little as three standards. Now the discharging rarely exceeds 100 to 125 standards per day, and very often it is a good deal less. One of the reasons for this slower discharge is that the composition of cargoes is so much worse than formerly, and the number of bills of lading, and also the men do not work as well. This autumn a most disastrous state of things has prevailed at the Surrey Docks. Owing to their crowded state, boats to the number of twelve or fifteen at a time, sometimes more, were waiting at Gravesend to get into the

Surrey Docks, and when they got in they often had to wait days before a start was made. Then discharging would go on so slowly that often only about 36 standards per day would be discharged. I, myself, had last week a steamer from Ship Island, near Mobile, that arrived at Gravesend on the 24th ult., and the earliest she could be discharged was the 23rd inst., and her whole cargo consisted of only 837 standards. My firm have also had lately, amongst others, the following steamers in to their address:—"Atbara," 22 days, with 1,500 standards; "Lady Salisbury," 16 days, with 660 standards; "Toftwood," 15 days, with 396 standards; "Rutherglen," 18 days, with 1,423 standards; and "Faedrelandet" 23½ days, with 698 standards. And two steamers, each about 21 days, have not yet finished discharging deckload. These times are from arrival at Gravesend and include Sundays. That was last week. Since then they have nearly discharged, but they have not yet finished. The cost of discharge for deals in London is 3s. to 3s. 6d., and for smaller stuff 6d. to 1s. more per standard. For pitch pine it is about 6s. At no place that I know of is the cost so much as in London, excepting Liverpool. At Southampton it is 2s. 2d.; at Dutch ports 1s. 8d.; at both as a rule you get as good if not much better despatch than London. I understand the Millwall Docks are making arrangements for taking these cargoes next year. This ought to relieve the strain to some extent, and the Surrey Commercial Docks are building another dock, but this will not be ready, I think, by next year. Of course, the present congestion at the Surrey Docks is abnormal, but often the glut is great. I do not say that the Surrey Commercial Docks have not done everything, under the circumstances, in their power to surmount the difficulties, indeed I think they have done so. I think the remedy for this state of things is for the merchants to agree to take their goods into the other docks as well as the Commercial, which at present they will not do, mainly owing, as I understand, to the fact that they cannot sell the wood in the other docks at so good a price, as buyers

Mr. A. S. Williams.

will not trouble to go to docks to look at a single cargo, but if each dock had a few cargoes this would probably be overcome. Grain is discharged in nearly all the docks, but the Millwall and Surrey Commercial Docks take most of the cargoes, unless the steamers are very large, in which case they then go to one of the other docks. I do not think that there is generally much complaint as to the rate of discharge with grain, as with the appliances the docks have I think this is all right. At all events I have not found the other ports in the United Kingdom quicker, excepting Liverpool. The cost of trimming bulk grain in London is 4d. per ton grain, and nothing charged the steamer for discharge. The cost of discharging grain in bags is 1s. 2d., to 1s. 3d. per ton grain. The dock dues range from 4½d. per ton net register to 6d., according to size of steamer.

2209. Do you say that London is a dearer port than Liverpool?—No, I think Liverpool is dearer.

2210. The dock dues are dearer in Liverpool, are they not?—Yes, and the discharging with wood is dearer.

2211. The dock dues in London are cheap for wood?—Yes, the dock dues in London are very cheap for wood.

2212. Will you give us any ideas you have as to the future administration of the Port of London?—I favour a dock trust, but I am not prepared to go into how that should be managed. I was not asked to do that.

2213. (Sir Robert Giffen.) What is the cause of the expense of discharging being greater in London if it is not a question of dock dues?—I cannot really say. I think labour, altogether, probably, is more expensive.

2214. Just because everything else is more expensive in London this is more expensive also?—I think so.

2215. But the differences are much greater than that. At Southampton it is 2s. 2d., and at Dutch ports 1s. 8d., where it is 3s. and 3s. 6d. in London, and in some cases more?—Yes.

2216. But wages are not twice as much in London as they are elsewhere?—No, I suppose our men want more luxuries. I do not know what it is.

2217. You have not gone into that question, how it is that the charges come out more?—No.

2218. A dock trust would not make any difference in that respect, would it?—I am afraid it would not.

2219. (Rear-Admiral Hext.) You say that in the early days timber went entirely on to the quay?—Yes.

2220. Would you prefer that system to the present one?—Yes, very much. A great deal of the detention now is owing to its going into barges, I consider.

2221. From different consignments, I suppose?—Yes.

2222. (Mr. Ellis.) Did you hear the evidence of Sir Thomas Sutherland, and the previous shipowners, to-day?—Yes.

2223. Do you concur with them that the grievances of shipowners may be classified mainly under two heads, detention and charges?—As far as my experience goes, hardly the latter, because I do not consider that London, for what I deal in, at present, is such an expensive port.

2224. Then you rather concur with Mr. Anderson, as I gather, that it is detention rather than charges?—Yes.

2225. And I suppose you would concur with all that Sir Thomas Sutherland said about quick despatch being the essence of the matter?—Yes, certainly.

2226. And that anything and everything that is done to promote quick despatch is so far beneficial to the Port of London?—Yes.

2227. Did you hear the few questions I asked Mr. Anderson about Tilbury?—Yes.

2228. Do you wish us to infer that if railway communication is good between a dock on the Thames and the warehouse very much higher up, the distance does not matter so much?—Yes, I think that would be so.

2229. Do you think there is anything in the matter of cartage—a kind of prejudice, or whatever it may be called, in favour of cartage?—I think there is the prejudice which would be overcome in course of time.

2230. Is it prejudice. Is it a matter of finance, or is

it what we all have—the prejudice against change?—I am inclined to think that it is the prejudice.

2231. And if the dock has rapid communication and uninterrupted communication by rail with a good warehouse at the other end, so far so good?—I think so.

2232. What is the number of your fleet?—Fifteen.

2233. And about the tonnage?—They range from 1,250, dead weight, to 6,200.

2234. Do you concur with all that has been said by shipowners about dredging and deepening the channel?—Yes.

2235. (Sir John Wolfe-Barry.) How do you account for the fact that the percentage of overside deliveries has increased so very greatly in the last ten years. We had Tables handed in to us by the chairman of the Surrey Commercial Docks, and it has increased, in round numbers, from 19 per cent. in 1890 to nearly 41 per cent. in 1899?—I may state that I had prepared my evidence before he gave that evidence, and, therefore, mine concurs pretty well with what he said with regard to the quantity. The reason, I take it, is that the dock charges are so heavy, and that the barges going in there pay nothing. See 1730.

2236. Therefore it is entirely financial, and not for the convenience of trade?—No, I think there would be more convenience if it were landed in the dock.

2237. Then supposing this was not discharged overside, somebody would have to pay more money. I mean supposing the percentage of nearly 41 per cent. was not so great or if the barges had to pay more money than they do now?—Certainly.

2238. And as a shipowner you say that would be a better thing than continuing the present system—looking to despatch?—Of course it would all depend upon the cost, but that being reasonable, certainly.

2239. You say that within moderate bounds that would be a better thing for the trade than continuing the present system?—I think so.

2240. And it would tend to diminish the delays upon the ships?—Yes.

2241. Then supposing this quantity of 41 per cent. was not discharged overside into barges, would not there of necessity be required a much larger quay space and wharf space?—Yes, I was going to say that. I think it would be an impossibility for the dock company to practically take any more on to the quays than they do now. At the present time, of course, the quays are very much blocked, and the docks too, but if all the goods that go overside had to go into the docks the thing could not be done.

2242. Not under present circumstances?—No, the trade has so enormously increased.

2243. That matter we have heard might be met, in general cargoes, by the construction of warehouses of two or three floors?—Yes.

2244. But do you see any way of meeting that point with regard to the timber trade?—Unless you go into another dock, because, quite apart from the question of sheds, which there are for the better class of goods, the dock sides themselves are all filled up.

2245. But there is no means of meeting the question for the timber trade such as there is for general cargoes by piling it up higher?—No, they are piled up pretty high now.

2246. Therefore, unless you had more quay space and more dock accommodation, the trade would suffer if you stopped the overside deliveries?—Yes, decidedly.

2247. (Mr. Ellis.) Do I understand you, in reply to the questions put by Sir John Wolfe-Barry, to say that the trade in the goods in question would bear a higher charge in transit if they obtain thereby more rapid despatch—within reason?—You mean from the shipowners' point of view now, do you?

2248. I am putting it from every point of view?—I think the shipowner would be inclined, if he could get better despatch, to pay something towards that, but I do not think that the way the timber trade is conducted at present a very large proportion of it could probably bear the expense of having to pay quay room, which it would have to do, instead of going into barges. The amount of profit in a good many instances is cut very fine indeed, and I do not think it could be done.

# ROYAL COMMISSION ON THE PORT OF LONDON.

## SEVENTH DAY.

*Thursday, 29th November 1900.*

PRESENT :

Sir ROBERT GIFFEN, K.C.B., LL.D., (*in the Chair*).

Sir JOHN WOLFE WOLFE-BARRY K.C.B., LL.D., F.R.S. | Rear-Admiral Sir JOHN HEXT, K.C.I.E.  
JOHN EDWARD ELLIS, Esq., M.P.

CECIL OWEN, Esq., *Secretary*.

Mr. WILLIAM BECKET HILL called and examined.

2249. (*Sir Robert Giffen.*) Will you kindly give us your evidence?—I carry on business in Liverpool and London. I am a director and manager of the firm of Allan Brothers and Company (Liverpool and London), Limited (commonly known as the "Allan" Line). I am also a member of the Council of the London Chamber of Commerce. Our steamers, amounting to a tonnage of about 150,000 tons, run from Liverpool to Quebec, Montreal, Newfoundland, Halifax, U.S., Philadelphia, Monte Video, and Buenos Ayres; and I have been connected with the management of these steamers since 1867. In 1883 we opened an office in London, and run lines of steamers from London to New York and Montreal. I had the establishment and management of these for fifteen years, so that I am well acquainted with steamer requirements and dock management in both London and Liverpool. When I came to London in 1883 to commence these steamers to New York and Montreal, I was surprised to find the London dock system so much behind Liverpool. Steamers that could be discharged in Liverpool in three or four days occupied fourteen days in London, owing to the prevailing system of discharging direct into lighters, thus necessitating sorting the cargo on the ship's deck, and continual shifting of lighters.

2250. Which of the docks in London do you specially refer to?—I commenced in the Victoria Dock; I then discharged the steamers in the Millwall Dock, and I finally used the Royal Albert Dock. At the time I came to London the Royal Albert Dock had only just been completed, and was almost empty, so I began in the Victoria Dock. You can see that if 80 or 90 per cent. of a ship's cargo is discharged into lighters it occasions a very great delay. If we attempt to discharge direct into lighters, it will take us two or three weeks to sort the goods on board the ship if the marks do not come straight. If, for instance, in a lot of flour the marks always came straight you could put it into the lighters, but if another mark of flour came, or another merchant was taking the same mark of flour, the work would be suspended. Then it was found to be impossible to sort general cargo on board to put into lighters, so that in the attempt to put into lighters to save the enormous dock charges on the quay, we often lost fourteen days. Steamers on which large sums of money had been spent in fuel and machinery to enable them to shorten the passage from the other side a day or two, were actually delayed as long as another voyage, in order to allow them to discharge; so that the speed of the steamer was of little value to the merchant owing to this London system; the real basis of the London system being that everything passing over the dock quay is charged an enormous sum, something like 4s. to 5s. a ton on the average, while in Liverpool, the same thing is only charged 1s. a ton. The consequence

is that all London commerce has to bear this charge of about 5s. a ton, levied by the dock wharves and the riverside wharves.

2251. Which goods in particular do you refer to now? 29 Nov. 1900.  
—Almost any goods that are imported. If you put them on the quay and cart them away from the quay, the dock charges vary according to the value of the goods; but I think you may take it as an average at about 5s. a ton. Naturally the London merchant and the London consumer has to pay this 5s. a ton, because if he does not pay it to the docks he pays it to the riverside warehouse. There is that tax on all the goods that come to London, for the simple reason that there is no free cartage. In Liverpool cargo is discharged on to the quays and sorted there. But I found that the dock charges in London, when anything passed over the quay, were prohibitive. After long negotiations I made arrangements with the Dock Companies by which, first of all, by payment of so much per ton, and latterly by payment of so much per square yard, we are enabled to discharge cargoes on the quay and sort them there for delivery to the lighters, using the quay for this purpose for a very limited time. The high charges of the dock companies still prevent goods being carted from the quay, as is the custom with the bulk of the goods in Liverpool. In Liverpool there is a charge varying according to the value of the goods, but on an average it is only a little over 1s. a ton, with the result that the inland warehouses, quite as well as the waterside warehouses, compete, and a great deal of the cargo can be sold ex quay, and in that case all the dues that the consumer or the customer has to bear is just about 1s. a ton. For instance, when we bring apples from America, sometimes as many as 20,000 barrels in one steamer, they are sold on the quay, and the consumer takes them away on his own carts, or they are taken straight away to the railway or the inland warehouses. The provision trade, for instance, in Liverpool has no warehouses on the quay, but carts its goods a distance of about six miles from the north or south end of Liverpool to the warehouses in Victoria Street. If the same practice existed in London, if any dock trust like the Liverpool Trust raised a revenue by a charge on the goods of about 1s. a ton, whether they go in lighters or go away in carts, the result would be that a warehousing dépôt or distributing centre in Islington would compete with warehouses on the riverside, and would be able to cart its goods right into the district of consumption at once, and any large shopkeepers would be able to buy the goods at the dock and cart away direct to their warehouses. As it is, a tax of about 5s. a ton is levied on all the goods that come to London either by docks or wharves. Out of this they do the receiving and storing, which is in most cases not necessary. The reason the dock companies pay so badly is that, owing to steam communication the consumer gets his supplies week

Mr.  
W. B. Hill.

Mr.  
W. B. HUL.  
29 Nov. 1900.

by week, and there are no large quantities warehoused; therefore the Dock Companies find that a great part of their income has gone. The Commercial Dock is an exception which only proves the rule. The reason for their prosperity is that nearly all the cargoes of wood are warehoused there, and it requires a large amount of warehousing room. When I found it was impossible to turn my steamers round, and to keep up a regular line without some improvement in the arrangement, and when I found that it was impossible to alter the London system of lighterage owing to the heavy charges levied for any goods carted, I made arrangements with the Dock Company by which I should be allowed to sort the goods on the quay. Instead of keeping the ships for fourteen days while I sorted the goods on the ship, I offered to pay the Dock Company so much for the use of their wharf for the purpose of sorting. That only allowed the goods to be passed over the wharf for sorting purposes at an extra payment to the Dock Company.

2252. How much was that payment?—I think it began first at about 3d. a ton, and it now averages, I believe, about 5d. a ton. That has been the system for many years in the North American trade.

2253. And for that charge do the goods go away in lighters?—Yes.

2254. And does that charge apply to cargoes carted as well?—No. If anything is taken away by a cart it has to pay the full dock dues—the full heavy quay dues—something like 4s. or 5s. a ton; so that the wharf is really used simply to sort the goods.

2255. Can you enumerate some of the articles upon which the 5s. a ton is charged?—The Chamber of Commerce have prepared a very full list of articles, and I think they have witnesses to prove them.

2256. I merely wish you to speak from your own experience?—If you will allow me I should have to get those details from my secretary. I speak from a general knowledge. One can be generally accurate in these matters without being minutely accurate. If you want exact evidence I must supply it. So long as the Albert Docks were not fully occupied we managed to arrange for the sorting of the cargo on the quay without very great inconvenience; but the Albert Docks were never intended for this sorting on the quay, so that from an up to date point of view they are very badly arranged. You can easily see that if you discharge a ship of 6,000 tons of cargo, filling the whole of the shed, you cannot put that into lighters until the ship goes away. These are the essential points I think about the London arrangements which make them so very much worse than Liverpool, and make the port so expensive and so objectionable to shipowners. The Albert Dock was not arranged for sorting on the quay and shipping off into lighter at all. You fill the whole of the shed with your cargo, and when your steamer goes away another one comes in, and it is almost impossible to get the stuff out of the shed again, because there is no quay side available for lighters. It should have been arranged as it is in the plans which have been prepared for the Dagenham Dock, which I see has been passed by Parliament, in which behind the shed there is a light draught canal in which the lighters being of light draught can go. For instance, if flour comes with a mark which runs straight, for which a lighter is waiting, you take it straight on to the lighter, and away it goes, and if the ship goes away and another ship arrives you can go on loading off quay into lighters and get the stuff away. I have been inconvenienced sometimes, too, by the limited accommodation in the Albert Dock. When we began 10 years ago there was ample room—it was almost a desert—and we could shift our steamer to fresh berths, and get our cargo into the lighters; but at present it is so crowded that when one ship discharges its cargo the next ship comes into the berth before you can get that into the lighters. When a man pays his steamer freight to get his goods brought to London in 12 days, the stuff is often 12 days lying on the quay before it can be put into his lighter. You can see also how bad it is for the shipowner, because a man with 6,000 tons of cargo wants a clear shed for sorting purposes, and finds it blocked up with the cargo of the previous boat. Thus he requires so many more steamers to carry on his trade than if worked on the Liverpool plan; yet as we all know, at Liverpool there is a handsome revenue and the docks are most prosperous. They have money for all purposes. For some years after I came to London in 1883 there was real competition amongst the docks. The India Docks, London Docks, and the

Millwall Docks all competed for steamer traffic, and it was possible to make arrangements for convenient berths and facilities. At that time also the shipowners were very largely represented on the Boards of both the London and India Docks—the Millwall Dock was also a competing dock, and was managed very economically; it was a modern dock, and had modern appliances; but upon the amalgamation of the London and India Docks the shipowning members were almost entirely dismissed. Of recent years the Millwall Dock has been subsidised by the amalgamated docks, so that there is really no competition whatever.

See 5628.

2257. How do you know about the Millwall Dock being subsidised?—That is a matter of common notoriety, but it is a matter upon which you could obtain exact information from the secretary of either dock company. I have loaded and discharged steamers in the Victoria Dock, Royal Albert Dock, and Millwall Dock. Steamers have been gradually increasing in size, and the Royal Albert Dock is the only one suitable for modern tonnage; and, as I said before, that is so occupied that it is impossible to get room for another line of steamers, and even for those that are there it is impossible to get quick discharge. I am glad to see that the dock company propose to extend it. A portion of one of the India Docks has been modernised—that is the India Basin—but that is in the hands of one firm. I tried to get a berth there, but could not. Owing to its distance from London, the Tilbury Dock is at a great disadvantage. The Tilbury Dock is almost as far from London as Manchester is from Liverpool, and Manchester has spent £16,000,000 to bring it a little nearer. It follows that berths in the Royal Albert Dock are very much sought after, and there is nothing to prevent favouritism in their allotment.

See 5628.

2258. But still that is not the same thing as an assertion that there is favouritism. You do not say that there is favouritism?—Well, I have reason to think that there is favouritism. Your own experience will show you that where there is no representation, or where there is a monopoly, it is difficult to get equity and justice. We were shareholders in the docks for some time—that was the only way in which one could get some influence—and I have attended some of the meetings and pointed out that in some respects the docks seem to be managed in an extravagant way. There are large pension funds, and very large amounts are paid for stationery, which perhaps is caused by what some of the witnesses will tell the Commission is the red tape system of the docks. A certain amount of red tape is necessary, but it may become too much. Then there is much useless expense in the handling of cargo. For instance, in Liverpool, it would be carted round in a lorry at a cost of about 1s. a ton, but here when transshipping cargo from one side of the dock to the other they often send it round in railway trains at an expense of shillings per ton. When I have asked for a lower rate from the dock company they have told me it was a great expense to put it in the train, and send it round the lines. And I have elicited that in this way it really costs a sum which, judging by what it cost in Liverpool, I could not have imagined possible.

See 5628.

2259. Why should it cost more by railway than by cart?—The railway wagons are outside. The goods are to be trucked to them, loaded in them, and covered, and an engine has to be brought, and perhaps it has to be brought round for miles; then it has to go over bridges and be subject to detentions; whereas in Liverpool you would simply put it on a lorry and take it round at a cost of 1s. a ton. A railway for short distances is not economical. Another point of extravagance, I think, in the management of the docks was this—I pointed it out, although it is rather against my own interest in the matter—that when the goods come for export the dock company sends them down from their stations in London, and puts them into the shed where our steamer is loading. In Liverpool when we wanted these goods our stavedores would take them from the shed, attach the ship's tackle to them, and load them into the ship. But in London we have to send round to the dock company for men to move those goods to the ship's tackle. That is an expense of about 2d. or 3d. a ton, for which the shipowner does not get any benefit. Although I have urged this at several annual meetings there has not been the slightest alteration. As, owing to the heavy charges, the bulk of the cargo goes away in lighters, it is necessary to find space along the quay front for these lighters to be loaded after the steamer has finished discharging and been removed. But such is the pressure on the space in the Albert Dock that

when one steamer has completed discharge, another arrives, and the goods are kept on the quay, and lighters detained for many days owing to the impossibility of finding loading berths for the lighters. In any properly designed dock for the London trade there should be shallow canals at the back of the sheds where the goods, after being sorted, can be put straight into lighters. I said before that the Albert Dock as a water space is admirable, but it was never designed for the London system of taking away cargo in lighters. The old dock, the Victoria Dock, was far better designed for that. In building the Royal Albert Dock they have built no double sheds like the docks in Liverpool have, so that you could load goods off into carts or lighters from the sheds by gravity; and of course, a double shed gives double the area of floor space. When a ship discharges 6,000 or 7,000 tons she wants a great amount of floor space, and if you have not enough floor space, and have to pile the cargo up, you see how the expense piles up. Then another point in which the Albert Dock is very much behind the Liverpool Docks is that instead of the sheds being close to the edge of the quay, as they are in Liverpool, they are set back about 50ft., 40ft. on the north side of the dock and 50ft. on the south side of the dock, thus exposing the goods to damages during discharge, or causing the discharge to be suspended entirely during rainy weather. Where I do my work the ship is 50ft. from the shed, and the shed is 120ft. across, that is 170ft. Look at the result! Look at the truckage that means! In Liverpool the goods go right from the ship's deck into the shed. We slide them down shoots. In London there is 50ft. of open quay that they have to cross, and the consequence is that the discharge has to be suspended entirely during rainy weather. The London workman puts on his coat the moment a shower of rain comes. In Liverpool the exposure on the wettest day is of the slightest character. The goods come up the hatch. Then they are put on a shoot, and go right under cover immediately. In the Albert Dock I cannot understand why this 50ft. space was ever left there, except that they provided it for rails. I think they have two lines of railway and one of crane rails. I had rather be without the cranes. We have no cranes in Liverpool, and discharge the cargo in half the time. In many ways the docks might be improved and modernised by judicious expenditure of capital. The India Docks require almost complete internal reconstruction. The Millwall Docks might be extended to the Isle of Dogs. Modern docks might be built at Dagenham, for which an Act of Parliament has been procured and excellent plans prepared. And there are many parts of the river where wharves, jetties or stages could be fitted for sea-going steamers to discharge promptly, like the cattle wharf at Deptford, or like that wharf just outside the entrance to the Royal Albert Dock which you have had particulars of; or like the wharf at Thames Haven, where discharge of steamers could take place quite as well as in the docks. All we want is a jetty with a light galvanised iron shed on it in which we could put the goods for sorting. If you had that parallel to the river bank you could easily see that the lighters would lie on the shallow water between the stage and the shore, and the ship would lie in the deep water outside. When the marks all come conveniently we should run the goods from the steamer across the jetty straight on to the lighter. We could manage without docks of any kind. The river is admirably adapted for wharves. Look at what has been done at Antwerp! Look at what has been done at New York, at Baltimore, and at Montreal! They have no docks there.

2260. Do you know something about Antwerp?—Yes; I am well acquainted with Antwerp. I have been there, and observed its great progress in recent years. The development of Antwerp and Hamburg has done a great deal to diminish our earnings from London. When I first came here, owing to transhipment cargo from the continent, we often got £2,000 or £3,000 freight outwards to New York. At the present time, owing to the development of Hamburg and the German ports, I do not suppose we get one quarter of that amount. Of course, if we do not get freight outwards we cannot afford to carry it cheaply homewards.

2261. I see you speak of Antwerp, and the foresight of the Municipality and the Government?—Yes; the Municipality of Antwerp is something like the Bristol Municipality in this respect. They have river and dock works there, like the works done by the Municipalities of Havre, Dieppe, and Boulogne, with the assistance of the French Government. There are magnificent engineering port works everywhere on the continent of late years.

4238.

2262. They have the assistance of the Government?—Yes. My steamers used to call at Havre, and I used to go there nearly every month, and take note of the Port progress. At Boulogne and Dieppe there are excellent dock works, paid for, not so much by the shipping or the commerce, but provided by the municipalities and the Government, with the view of attracting steamers. The discharge berths at Antwerp in the river are equal or preferable to docks for ocean-going steamers. If proper facilities are not soon provided in London for the modern type of carrying steamer, London will have to pay a heavy tax in the shape of higher freights and railway carriage from the out-ports, Southampton, Bristol, Liverpool, and Hull. I see that the Bristol Corporation has appointed a committee to consider a plan for extending their docks at a cost of £1,800,000, and one reason given for this was that the accommodation in London was very bad, and that they would be able to supply London by railway from Bristol docks.

(Mr. Ellis.) I must interpose here. That is a statement from the witness as a matter of common knowledge. That is a piece of argument; it is not evidence in the proper sense of the word. The witness is not specifically seized of that fact; it is argument. We shall burden our notes with argument if we do not take care.

2263. (Sir Robert Giffen.) Will you confine yourself to facts?—A great deal of what I have said has been intended more, if you will pardon me saying so, as hints to the Commissioners to get evidence.

(Mr. Ellis.) It is not for witnesses to come here and give us hints. We are responsible to those by whom we were appointed. It is not for witnesses to come here and give us hints at all; that is beyond their function.

2264. (Sir Robert Giffen.) I think you had better go on with your statement about modern steamers.—Modern steamers to be worked economically must be of large size and must have despatch. The ordinary cargoes of provisions, food stuffs, etc., from across the Atlantic are from 6,000 to 8,000 tons, and these steamers are discharged and loaded in Liverpool within a week. Lines of steamers will avoid a port where they cannot rely upon quick despatch, as their sailing dates from both sides are fixed, and if there is any uncertainty in the facilities, an extra number of steamers is required to keep up the regularity of the line, entailing great expense. The cost of a modern steamer of this class is from £110,000 to £150,000, and the daily expenses from £100 to £200. Thus you can see, if you keep up a line with regular intervals, if one steamer is delayed and you have five steamers running, it throws a similar delay on every steamer in the line, which is a very serious consideration. Owners of trading steamers (generally called "tramp" steamers) also avoid those ports where they cannot get their steamers away as fast as they can get the cargo out. The result is to diminish competition, and increase freights at those ports that are not up to date. I consider it would be an actual saving to London to have her docks and river made attractive to ocean-going steamers, even if it had to be done by levying dues upon all cargo, or even by a rate upon the property of the city itself.

2265. I think you might stop at that point. I see you desire to express the opinion that it is not desirable that the dock companies should levy the dues, but we do not wish to go into that argument now. Then you make a suggestion with regard to a dock trust?—If revenues of this kind are to be raised I should suggest that they should be raised and expended by a public trust such as we have in the Mersey and the Clyde, a trust with power to levy dues on ships and goods, and with power to raise money on the security of these rates, for the deepening of the approaches and the development of the docks and river. As in Liverpool, the payers of dues and the shippers of goods should be represented on the trust, and there should be official or nominated members, appointed by the Government, the city, and the County Council.

2266. Then you have a suggestion to make with regard to the Watermen's Company?—Yes; I consider that the monopoly enjoyed by the Watermen's Company, with regard to the licensing of men employed in barges and other craft on the river Thames should be abolished in the interests of the Port of London. On that I could also give some personal evidence founded upon my experience in Liverpool. I have had a fleet of steam and sailing barges and tug-boats in Liverpool and the Mersey ever since 1880. There are no restrictions upon what seafaring men we should employ in these tugs or in these lighters. The Mersey is very dangerous; sometimes the ferry service has to be suspended. We have gales often, and always a very strong tide running 8 or 9 knots. Mary

Mr.  
W. B. Hill.  
29 Nov. 1900.

**Mr. W. B. Hill.** barges sail across the river in spite of these difficulties. Although there is no examination for the men, no apprenticeship or company to licence or examine them, the accidents with barges in the Mersey are very trifling. We have never had the least difficulty in getting competent seafaring men to man these lighters and steam tugs, and even sailing barges. I am of opinion that the City Police should be substituted for the Dock Police.

(The witness having made some further statements),

(**Mr. Ellis.**) I think we had better retire to consider this evidence.

(**Sir Robert Giffen**) Yes.

(The members of the Commission retired to consult.)

(**Sir Robert Giffen.**) We have considered this matter, and have agreed that beyond the expression of an opinion that the present police should be replaced by other supervision, the statements you have just made must be struck out of the evidence.

(**Witness.**) This evidence was based upon Question 1,180, in which the Chamber of Commerce was asked to show by witnesses that there was a bad system prevailing in the Port of London both as to ships and the storage of goods.

2267. That is a matter we cannot go into in this form. We cannot go into criminal charges; we cannot investigate them?—Will you allow me to put in on behalf of the Chamber of Commerce correspondence with the Auckland Chamber of Commerce, complaining of the pilferage in London?

2268. Not if it goes into special cases of that kind?—It does not go into special cases

(**Mr. Ellis.**) We had better reserve that until Lord Egerton is present.

2269. (**Sir Robert Giffen.**) Does that complete your evidence in chief?—There was one point I had overlooked. As the Commissioners have taken into consideration the heavy London charges, there is one point I think I ought to mention briefly, and that is that the pilotages are very much heavier in London than in Liverpool. I have here, and I will leave with the Commission, pilotage bills in connection with our steamship "Livonian," of Liverpool. They are with regard to two successive voyages, one from Montreal to Liverpool, and one to London. The draughts were almost identical. You will see the difference in cost. On the London voyage her pilotage was £38 13s. 5d.; on the Liverpool voyage it was £13 10s.; that is nearly three times as much for London. The heavy cost incurred is mainly owing to there being two classes of pilots in London, one to take the steamer from the dock to Gravesend, and a second pilot to conduct her thence to the sea. In olden times, when there were few steamers, this plan may have been necessary. The ship may have been beating up a long time; perhaps she would be a week in beating up to port, and the other pilot might be tired out; but now, where the entire time occupied in the passage from the dock to Deal or Dover, or vice versa, is only six or eight hours, two pilots are superfluous, and the stop at Gravesend to change the pilot causes delay. The rates charged are also excessive; they have recently been revised, but they remain much greater than they should be to give a pilot a fair remuneration. The rates I have quoted are the recently revised rates. I may say *a propos* of this, that in Liverpool a steamship line can choose its own pilot provided that the pilot's work contributes to the revenue £300 a year. In London the choice pilots will make incomes from £1,000 to £1,500 a year, which is more than we pay our best captains. That shows that the rate of pilotage is excessive. I should like, if there is a London Dock Trust, that that should be one of the things embraced in the powers of the Trust. It has been said that the dock dues on ships in London are rather lower than they are in Liverpool. We pay in London 1s. to the dock, and in Liverpool we pay 1s. 5d. That is not exactly a comparison, because in Liverpool you can use the docks for two months without payment and in London you can use them only for one month; but you must add to that charge the Conservancy dues, namely 1½d. a ton. In Liverpool the Docks and the Conservancy are one body; one body levies the rates for both purposes. So you must add to the 1s. we pay in London 1½d. for the tonnage dues paid to the Conservancy, and about 5d. a ton for the dock company for quay space to manipulate the cargo. Together these sums amount to 1s. 6½d. a ton on the net register, so that the dues on vessels in London and Liverpool are practically the same. For my part I

See 8471.

See 8471.

do not fear extra dues on the steamers, because a penny or two on a steamer's tonnage is nothing compared with the importance of despatch. Considering the competition of Southampton, and the fact that many steamers have gone to Southampton, and the railway facilities to and from Southampton, it might be dangerous to increase the dues on the ships. Then as to the tug attendance in the docks. In Liverpool any tug company can put tug-boats in the docks if they pass a proper survey, but here the dock company have the monopoly of that also, so that we have no control over the boats or over their rates. Where we have control over the tugs, say, in bringing our steamers from Gravesend to the dock, about 20 miles, we pay £5 14s. 0d.; the dock company's charge for a service of about half a mile for bringing us to the dock gates is about £5, and that is really for facilitating their own business in the dock; without tugs we should simply haul the steamers. Then again, another of the excessive charges in London is the dock company's charge for water, which is very heavy. The dock company only pay the water company 6d. per thousand gallons, and they charge the steamers 6s. to 8s. per thousand gallons according to the quantity taken. That is a very large profit—1,200 per cent. As regards the depth of water in the river, the entrances of the Millwall Dock and the Royal Albert Dock are very good entrances, and excellently managed. I do not know any dock entrance in Liverpool that does its work better than the Royal Albert Dock entrance, or that does as much work in the same time. They are excellent entrances in every way, and very well suited to all except the few extreme-sized ships, which are probably increasing, and should be provided for progressively. If the depth of water in the river opposite the docks was three or four feet more than in the docks or on the dock sill, and was maintained for three or four hours before and after high water, we could manage with that, and (until the river could be deepened to the 26ft. or 30ft. that has been talked about), if a lay-bye were provided, so that in case we miss getting into the dock we could go to the buoys without going back to Gravesend, I think then we should have very little to complain about the river or the dock entrances. I think that is the whole of my evidence.

2270. Could you give us any information about the dues on shipping at Antwerp compared with London?—I cannot; I should have to get that from our books.

2271. You have not got that information present?—I have not. Another defect of the docks is that they have extremely bad roads. I do not know whether the Commissioners may have seen that. See 5184, 7751.

2272. That has been mentioned. Have you made application to the companies to have a better representation of shipowners upon the Dock Boards?—I have not made any personal application.

2273. I merely wish to know how far the matter has been the subject of consideration and agitation amongst you to get better representation by direct application to the dock companies?—I have not heard of any application being made. There has been a great deal of dissatisfaction since the amalgamation of the companies, and since the exclusion of the shipping members from the Board. I have never heard that it has crystallised into a deputation or an agitation.

2274. You say that the dock companies are extravagant in their methods of management, and you refer to stationery and other things. But Sir Thomas Sutherland has told us that he thought the dock companies were extremely economical?—They are economical in their roads, I must say. In some points where facilities are essential they are economical, but in the matter I have mentioned, I do not think they are economical. See 1766.

2275. (**Sir John Wolfe-Barry.**) You said something about maintaining the depth of water outside the dock entrance for two or three hours. What had you in view there?—So that if a steamer has to wait at the dock, and the tide is falling, or if the steamer wants to come up rather early on the tide, when there are five or six steamers entering the Royal Albert Dock that tide, you do not want to be stranded outside.

2276. That is not a question of maintaining the depth of water, but of digging the bottom away; is not that so?—Yes.

2277. (**Mr. Ellis.**) What is the number of vessels in your fleet?—I cannot tell you offhand the number of vessels; their name is legion; but we have 150,000 tons.

2278. Give us some idea. What would be about the average tonnage; have you 50 vessels or 100 vessels; you can give us some approximate idea?—I really could not tell you within 10 or 15.

2279. Give us within 10?—I will divide the 150,000 tons—

2280. You are a shipowner of great experience; you surely must know?—But one's experience is not directed to matters of that kind very much.

2281. Is it not a very high figure—100 or 150?—The tonnage is what one generally looks at. I should think about 50 steamers.

2282. I gather that you lay more stress upon the charges in London than some of your colleagues, who are shipowners, who came before us before; that is so, is it not?—No; I do not think that I complain about the charges on the steamers.

2283. But the charges of the port I am alluding to?—What I complain about, and what makes the port expensive to a steamship owner, is its want of despatch.

2284. Let me refer you to Question 2095, in Mr. Anderson's evidence. The Chairman put this to him: "You have told us just now that London was a dearer port than others. Will you tell us in respect of what particular items such is the case?" The answer to that is: "I tried to guard myself against dealing with that, because beyond the pilotage and detention and labour, I am not quite sure that I could make out the case for London being dearer." Then Question 2096: "Therefore, when you say London is a more expensive port, you do not care to go on?"—"No; I do not lay great stress upon it, except in these matters." Do you concur with Mr. Anderson?—I say, as regards the shipowners, I do not know about the merchants; it is for the merchants to show that the charges are higher. I am not a merchant; but I say, as regards the shipowner, the dock charges are not excessive, and the docks themselves, as regards their entrances and management, from a navigation point of view leave little to complain about. But they are certainly deficient in facilities for despatch. We have not got the room, the dock accommodation, to turn the steamers round as quickly as they are turned round at Liverpool.

2285. Then you concur in fact with Mr. Anderson when he goes on to say: "I lean more on the detention"?—Yes, exactly.

2286. Your evidence is similar to his on that point?—Yes.

2287. You said something about competition. You said in 1883 there was real competition?—Amongst the docks, yes. Each dock company was anxious to secure me as a tenant; consequently they would give me facilities in the way of convenient berths, convenient arrangement for discharge, and so forth.

2288. You think amalgamation, to the extent it has prevented competition, has been detrimental to the shipping?—Most detrimental.

2289. Is your ideal to have the docks of London in quite a number of hands?—Either there should be competition as you suggest in a number of hands, or the monopoly should be one carried out for the public interest by a public body. It would be most dangerous to have the monopoly in the hands of a company of shareholders.

2290. You would eliminate the desire to make interest on capital?—Exactly.

2291. You would have it as in Liverpool, I suppose, so that all the money raised in rates should be expended in the development of the port?—Then we do not care how much they raise the rates; we feel we are getting value for it.

2292. You think then there would be no temptation in the hands of the governing body to what you rather indicated—you used the word, I do not use it—favouritism?—No, we do not find it in Liverpool. Justice is done to everyone. Every interest is represented on the Board. I do not think there are any complaints in Liverpool of favouritism. A trade gets its berth accommodation according to its importance.

2293-4. When you make the statement that shipowning members are almost entirely dismissed—"dismissed" is a strong word, is it not—how did the change come about?—The moment the two companies amalgamated

they reduced their Board, and they expelled the shipowning members.

2295. It so happened, for reasons which you do not enter into, that the shipowning interest disappeared?—They had an idea that the shipowning interest prevented their earning as much dividend, and that it was too much represented on the Board, consequently when they effected the amalgamation after the loss of the money at the Tilbury Dock they were on an economical basis, and they wanted to administer the docks simply in the interests of the dock shareholders; consequently they got rid of the shipowning members.

2296. You are a shareholder, I believe?—I am not a shareholder now, but I was a shareholder for several years in order that I might have some influence.

2297. I only gathered that because you say you pointed out at the meetings. You held shares?—I held shares so that I might have an opportunity of criticising matters at the annual meetings.

2298. You held the shares in the interest of the shipowners?—Yes.

2299. *Ad hoc*?—And the general interest. Our principal interest is in Liverpool; it is only in the public interest that I come and trouble you in London.

2300. You say there is money wasted in the docks. Then there is money to waste if money is wasted?—I think the docks will never pay a decent dividend on the present system. They have not even sufficient money to make good roads or for good watching, or to provide modern facilities. The Millwall Dock was a modern dock, and was far too economically managed, and still it would not pay.

2301. There it is the other way; not money enough spent, is it? You say far too economical?—Far too economical to be efficient, but with all their economy it would not pay. You cannot make a dock in London pay under the present conditions.

2302. But I do gather from your point of view there is waste at the docks, that is to say money is spent in the wrong way?—In one or two points I have mentioned, I say I do not think they are quite as economical as they might be. I took the trouble to point it out to them. It is against my own interest. I should have to make my stevedores do a little more handling to the goods, but I pointed out to the company as a shareholder, and in the general interest, that they would save 2d. or 3d. a ton if they did as is done in Liverpool; but instead of that they went on in the old fashioned way.

2303. Do you think, when comparing the railway service at the docks in London with the horse service of cartage, you are comparing precisely the same things, or things under the same conditions?—I think so. The goods that come here from North America are very much of the same class as the goods that come to Liverpool, and there we get our cartage done for 1s. or 1s. 3d. a ton. A lorry on four wheels carries five or six tons, and is drawn by one horse in the shafts and one leader.

2304. You think that traction in a trolley is really as cheap?—For short distances it is as economical, or more economical.

2305. What do you call a short distance?—Round the dock. For instance, if I had to bring goods from a ship in the Albert Dock to the Victoria Dock, it is more economical. I could not understand the Dock Company charging so much for the service. They explained to me that it was expensive to rail the goods round the dock.

2306. You used the expression that you would like to see a complete internal reconstruction of the dock system in London?—With regard to the Albert Dock, I should like to see that extended, and the new docks to be better arranged with regard to the lighterage business; that is to say, some jetty system by which we could pass cargo right across into the lighter, and keep on loading all the lighters while the ship is being discharged. As it is, we discharge the cargo, and the quay is covered with cargo; there is no room, and the merchant cannot get his goods away sometimes for a fortnight. Then I should double the sheds, so that you would have double the floor space, by putting a large portion of the goods in an upper shed, as they do in Liverpool.

2307. You lay very great stress, primary stress, upon quick despatch?—That is of the greatest importance.

*Mr. W. B. Hill.* 2308. Do you concur with Sir Thomas Sutherland in all that he said with regard to the deepening of the channel?—I see Sir Thomas Sutherland mentioned 26ft. up to the Albert Dock. I should think that is quite ample. You must remember that the draught of steamers is limited not by London alone, but by the whole world. For instance, at Montreal you cannot get a draught of more than about 26ft. at the best time of the year. You cannot get through the Suez Canal with more than 25ft. 6in. You cannot go to Baltimore or Buenos Ayres with deep draught ships. Ships have to be built so that they could go all over the world. Therefore, I think the deepening of the river might be done slowly and progressively, after the important point is provided of making it safe for a ship to lie somewhere if she misses docking.

*See 2251.* 2309. You said in your evidence: "After long negotiations I made arrangements with the dock companies by which, first of all, by payment of so much per ton, and latterly by payment of so much per square yard." Will you just give me the date when you made this arrangement?—I am afraid I should have to ask the permission of the Commission to get the exact dates and bring them here. I should think it was four or five years after I came to London.

2310. That would fix the date?—I could give you the date exactly from the correspondence.

2311. Would it be at the end of the eighties? Would it be about 1889?—1887 or 1888, I should think.

2312. (*Rear-Admiral Hext.*) You were advocating just now more wharves in the Thames. Do you as a shipowner prefer a wharf to a dock?—For the mode of business adopted in London of putting the greater portion of the cargo into lighters I think wharves in the river have great advantages over docks.

2313. Wharves such as you propose to build?—Wharves such as I propose to build, and which I applied to the Thames Conservancy for permission to make.

2314. At the same time you cannot compare a wharf that you propose to be built unless you also compare the dock that you propose to be built. Supposing the dock had what you advocated, namely, a canal at the back of the shed for lighters, which do you prefer as a shipowner—docks or wharves?—A dock has the advantage that the height of the water is maintained.

2315. I understand that, but I am asking you as a shipowner which you prefer?—I should prefer a dock, but a wharf would be convenient, and would cost less to make. In Montreal we only have wharves; in St. John, New Brunswick, we only have wharves.

2316. The rise and fall comes into consideration?—You will be aware there is a very great rise and fall at St. John, New Brunswick—something like 30ft.

2317. With regard to lighters using the docks, have you ever formed any opinion whether they should be charged or be entirely exempt?—I think that goods, whether they go away in lighters or whether they go in carts, ought to pay the same rates.

2318. Therefore you say you think they should be

exempt?—I think they should not be exempt. I think that on all goods equally, whether they go by carts or by lighters, the charge should be level.

2319. In advocating a trust you would place virtually everything in that trust—pilotage of the river, buoying, deepening, in fact, the whole control?—Yes, as in Liverpool. Liverpool has the conservancy of the river as well as the docks and the pilotage, and I am not sure, but I think some part of the lighting. I may say, as regards the wharf in the river, I was very anxious to make an experiment, as no public body was doing it, and I applied to the Thames Conservancy for permission to make one in the Thames near the Millwall Dock. I found, however, that their restrictions utterly prevent such a thing being done by any private person. I lost nearly two years in applying to the Thames Conservancy, and I found that not only did they require to be satisfied that there would be no injury to the navigation, and naturally so, and that there would be no injury to your neighbour's property (naturally that would be their duty); but I found they had a cut and dried rule by which you must obtain the written consent of your neighbours on both sides. That of course is impossible to obtain, or almost impossible, at all events sufficiently impossible to prevent any man attempting to build a wharf for his own steamers in the river. If I went to my neighbour—I was not proposing to put my wharf in front of my neighbour's property—but if I went to him and asked him for his consent he would ask, "What are you going to give me for my consent?" In this case I was fortunately able, after some months, to obtain the consent of my neighbours on both sides by certain concessions or privileges or opportunities I offered them. Then I found the Conservancy said: "You must not only do that, but you must get the consent of the freeholder. The freeholder's interest did not come in for fifty years. I represented to the Conservancy that the freeholder was not affected; the wharf would not depreciate the property, and the freeholder could make me remove it if he did not like it. That his interest 50 years off was very trifling. But they said, "No, you have to get the consent of the freeholder too." Well, it was evidently impossible to do anything without an Act of Parliament; so I left it.

2320. (*Sir John Wolfe-Barry.*) When you applied for permission to build your wharf, were you intending to advance the frontage line beyond that of your neighbours?—No.

2321. Were you proposing to maintain the old frontage line?—Yes.

2322. Can you tell us what the present depth of the Suez Canal is?—I think you had that from Sir Thomas Sutherland.

2323. Do you happen to know the depth of the North Holland Canal?—I do not.

2324. Or the depth into Southampton?—I have been to Southampton; my ships have been there, and I have been there myself, but I cannot tell of my own knowledge. It is an excellent harbour at all times of the tide.

Mr. JOHN ERNEST MATTHEWS called and examined.

*Mr. J. E. Matthews.* 2325. (*Sir Robert Giffen.*) You are a member of the firm of Matthews and Luff, shipbrokers, of 52, Leadenhall-street, E.C., and M. H. and J. E. Matthews, shipowners, of London and Cardiff?—Yes.

2326. I see you begin the statement of your evidence by a reference to the number of port authorities, and you quote the return of the Rivers Committee of the London County Council. As we shall have the County Council witnesses before us on Tuesday next, I do not propose to ask you anything upon that, but I will take your opinion on this. You say that there should be only one authority. Will you give me your reason for that, and then continue your evidence from that point?—The port authority should have control of the estuary as far as the Naze and the North Foreland, because the dredging, lighting, buoying, watching of tides and channels and general regulations as to the use of and preserving the channels should all be carried out with unity of aim and purpose. Lighting, buoying, dredging, and pilotage I shall refer to under separate headings. I wish, however, to call attention to the fact that at present next to no use is made of some very fine waterways in the Thames estuary. I refer to three large tidal rivers or creeks in Essex—the

Colne, the Blackwater, and the Crouch. No dredging is undertaken to keep the entrances clear, and the buoying and lighting in two of the entrances, the Blackwater and the Colne, is insufficient, and at the entrance of the Crouch there is no light whatever, and the nearest buoy is five miles from the river heads, and the Crouch is the best river of the three for navigable purposes for any distance inland. This river has a deep water channel for about twelve to fifteen miles suitable for the erection of factories upon its banks, and even shipbuilding might be effectively carried on. All that is required is dredging of some five miles of the Whitaker Channel, say from the Whitaker Beacon to the West Buxey Buoy, and properly buoying and lighting the entrance from the Swin to the river heads. But my chief reason for calling attention to these bye-ports of the estuary is that they could, if the entrance channels were looked after, be developed into transhipping stations where ships could unload into sailing barges, relieving the congestion of the upper or central port. This transhipping is at the present time continually taking place in the River Orwell, 20 to 30 miles further from London, and if from the River Orwell why not from these other stations? The result of transshipments from the River Orwell to London is that

*See 9791-3*

*See 2034-7.*

the goods can be brought up to London by sailing barge at 2s. 6d. per ton, taken direct to the spot they are wanted, or to a railway wharf, and save some 7s. or 8s. of landing or warehousing charges at the London Docks, and in the case of foreign wheat possibly save the consumer some 4s. or 5s. per ton in the price of flour, etc. There are not many wharves in London that would take grain steamers, but if a steamer went to a wharf it would be so much less. At the time I am writing steamers with wood cargoes are waiting six to eight days outside the Surrey Commercial Docks for permission to enter, owing to congestion of traffic. There are a thousand acres of land flooded every high water from the waters of the Crouch, which would make splendid timber ponds, which are quite close to Farnbridge Railway Station on the Great Eastern Railway, and which could be bought for a nominal sum; and plenty of cheap land adjacent suitable for storage of deals, about one hour by rail from London (2s. 6d. return fare), could relieve this congestion in the wood trade if the channel into the Crouch were buoyed, lighted, and dredged. I mention the passenger fare because it is a convenience for people to go down and sample goods or anything of that kind. There is a very large district down Ilford way—from Bow to Ilford, and even as far as Romford, on which a great deal of building is going on. Also such goods could be despatched by rail to the East End of London at about the same expense as from the Surrey Commercial Docks.

2327. Now will you deal with the question of dredging?—Yes. I cannot give you direct evidence on that.

2328. We had rather not take it from you if we can get it more direct from somebody else?—I have only what evidence has been put before the Commission.

2329. Then we will go on to the next question, what have you to say with regard to lighting and buoying?—You have had evidence as to buoys. I cannot give you any more evidence on that. I can particularly give you evidence on matters of pilotage.

2330. Then we will take what you have to say about pilotage?—The pilotage authority is also the Elder Brethren of the Trinity, and yet one may say it is or is not, and both with some truth. The Brethren license the pilots, compile the tariff, and the pilots are called Trinity pilots. The Brethren have powers which enable them to enforce their pilots upon shipping coming from foreign ports beyond Brest. That means south of Brest. The tariff is very high on small ships. The Brethren accept no responsibility if their pilot by carelessness or incompetence causes damage to your ship or causes your ship to damage another; you have no recourse against the Trinity House, and your recourse against the pilot is worth nothing, for the pilot, although making good money, is careful to own nothing. The pilot nominally has to give security for the sum of £100, but I have never heard of a case where the cash was seizable. The Trinity House enforces their tariff, but the pilot, except in the case of foreign vessels, has to collect his own pilotage from the shipbroker, who becomes responsible for this money, if he report the ship at the Customs House, though the shipowner may never refund the money. In practice the money is usually collected by a publican or an agent. Now as to the justice of the pilotage tariff. The charge is so much per foot. A ship of 500 tons will probably draw 15ft.; a modern steamer of 3,000 tons will draw possibly only 19ft., say 22ft. The former will pay £7 10s. 0d. and 20s. landing money, the latter £11 and 20s. landing money from the Downs. This, it can be seen at once, is very unfair. The charge is excessive on the small ship and very easy on the large ship. What should be charged is a tonnage rate. It should all be collected by the pilotage authority, and the pilots paid a regular salary. I may add here that I consider that the pilot's employment should be an exclusive employment. At present a pilot may be a coal merchant down at Gravesend, or in some places he has possession of some of the moorings in the Pool which he makes the money out of, and so on. I consider that a pilot should be paid a salary, and that it should be an exclusive employment. Then with regard to the question of whether the authority should be liable for damages in the case of a drunken, incompetent or careless pilot causing an accident, that is rather a difficult subject, and perhaps I have gone a little too far in that. I would qualify that, because I conceive it might be somewhat difficult to make an authority responsible for damages in such a case.

4238—7.

2331. (Sir John Wolfe-Barry.) Then perhaps you will withdraw that?—Yes, I withdraw that. At present some pilots are hardly making a living. They hang round for jobs, and they come to our office sometimes asking for jobs. Those are, I suppose, the newer pilots that are taken on. Others are making a great deal of money. Evidence has been given to-day that some of them make up to £1,500 a year. The excessive charge on a small steamer occurs again in a different form on a small vessel trading just beyond Brest, say Nantes or St. Nazaire; she draws, say, 12ft., and is liable to £7 pilotage, including landing money, Downs to Gravesend. This vessel may be coming into London 12 times in the course of a year. There are a number of small sailing vessels which come into London, say, with nuts from Spain. Perhaps they only carry about 100 tons, and draw 11ft. or 12ft. of water. They may come in several times a year, and they have to pay this heavy pilotage every time and 20s. for landing money. The captain knows the river and estuary channels as well as the pilot, and can handle his little ship much better, but he has to pay £7 for what he does not want, and, say, carries only 150 to 200 tons. It is those kinds of injustice in connection with port charges which give a port a bad name, and make owners avoid it whenever possible, which eventually means a higher rate of freight to go to London than to Harwich or Southampton. The system is full of anomalies that it is impossible entirely to go into—well, it is not impossible, but it would take a long time to go into all of them. The pilotage tariff should be re-organised, and this matter taken over by the port authority. I should like to add here that there is also a question of overlapping between the Thames Conservancy and the Trinity House in the question of pilotage. For instance, on the 7th February a little sailing ship called the "Adelaide," from a port in Mexico, came in. She delivered part of her cargo at Antwerp, and then came over with the balance to London. As his port of loading was not Antwerp, but "beyond Brest," the captain was under compulsory pilotage. He was compelled to take the Trinity pilot. He told the Trinity pilot to what place he was ordered to go, and the Trinity pilot took him to a certain buoy, and made him fast there, and left him there. He had not been there many hours before one of the harbour masters or deputy harbour masters came along and said: "Get out of this. You have no business here. That is not the place for you to lie. You must go over there." The man said: "No; I was taken in charge by a pilot of the port; he put me here, and I will remain here until I see my broker." He came up to consult me on the matter, and we wrote to the Thames Conservancy on the subject, but we got no satisfaction out of them at all. What occurred was this:—At a cost of £4, he had to employ a tug to shift him to the place where the Thames Conservancy said he was to lie; and also the Thames Conservancy sued him at the Police Court for not shifting when he was told, which caused him further expense for appearance there. That was caused by having the two authorities.

2332. Then have you anything to say about floating coal derricks?—Yes. Those floating coal derricks are now in the hands of one firm. There is now a combination; it is all one concern. I think this should be in the hands of the port authority and worked by them. The Thames Conservancy have said that they have not sufficient money, but they are throwing money away by handing them over for a very small sum. I have tried to get at what it is, but I have not been able to. I have asked one of the members of the Thames Conservancy, and he has asked the Secretary, but I have not been able to get the amount, even from the report or their accounts, of what is paid by this firm for the derricks.

2333. Then you complain of their action?—I say that here is an opportunity for them to make money for other purposes, and they hand it over to another firm instead of keeping it in their own hands.

2334. Then with regard to moorings in general?—The Thames Conservancy report an annual loss of about £6,000 on moorings, and no wonder, See 7544—5. for a more antiquated system of working the moorings exists nowhere, and in looking over some old Parliamentary Reports I found the same system existed 100 and even 200 years ago. Most of the moorings in the Thames belong to the Thames Conservancy; there are some, I understand, that are private property. One does not get any enlightenment from the Conservancy balance-

Mr. J.  
E. Matthews.  
29 Nov. 1900.

Mr. J.  
E. Matthews  
29 Nov. 1900.

sheets, but one must presume that the £6,000 per annum debited to moorings goes to their upkeep. The Conservancy do not make a charge directly to the shipping using them, and they do not employ any staff to serve them; in fact, there is no tariff for moorings in the Port of London. These moorings are either let or farmed out, and, if so, I should like to know what rent the Thames Conservancy receive for them, or are they handed over to private individuals free of rent to make what they can out of them. I am presuming this. I do not know it direct, but I am showing you that I have evidence on the subject of payments. Those individuals have often other work to attend to, and sub-let or hand them over to others to work them, and in some cases they are handed over to the charge of a third party. As I have said, there is no fixed tariff, and there are often disputes arising as to the charge made. A steamer trading regularly to certain moorings has, of course, fought the matter out to begin with, and afterwards pays a regular sum, but this varies in different cases, and not always in accordance with the size of the steamer. A stranger will always be charged more; in fact, the principle seems to be to charge what they can get. This causes friction and unpleasantness, and works against the popularity of the port. Certainly it would be a much better system to have fixed charges according to tonnage, and to have a responsible official of the Port Authority in charge to serve the moorings.

2335. Then we come to the subject of public or municipal wharves and quays?—Yes. I can give evidence direct as to that, having been in Hamburg and knowing Antwerp well.

2336. Will you tell us what you have to say on that subject?—There are no public or municipal river wharves and quays in the Port of London, and therefore we have no deep water river wharves and quays where large modern steamers can come alongside at any state of the tide, and lie afloat at low water. When I say deep water, I mean in comparison with those at Antwerp, where large modern steamers can go alongside. At Hamburg there is a splendid system of such wharves, the docks are all tidal, and no locking or unlocking is necessary. At Antwerp the North German Lloyds, and other large steamers, use the river quays—municipal property—that is to say, they are managed by the municipal authority, although the larger part is paid for by the Government.

2337. Do you know that as a fact from your own acquaintance with Antwerp?—I know that as a fact from a direct statement by a gentleman on the Municipal Council, who gave me information which I will mention presently. At Glasgow they have deep water river quays, and in the Tyne and the Tees there are also many good river wharves and stages where large ships can lie safely. Is it for a port with the enormous trade of London to be behind Hamburg, Antwerp, and Glasgow in this respect? Why does she not lead the way instead of lagging behind?

2338. Now you are getting into an argument rather than giving evidence?—Yes, I quite agree, but this, I think, comes to a matter of fact. At Antwerp the municipal authority has effected the works. When, however, the works were first completed, sufficiently for traffic, the authority made this mistake, by raising all the current expenditure from the shipping and cargo using the port, with the very natural result that after a short period of increased activity, owing to the advertisement of the facilities provided, the trade began to leave the port, and at length the difference was strongly marked. I was frequently over at Antwerp at that time, and was told by the people there interested in the trade of the port, that merchandise that used to pass through Antwerp was then going to Rotterdam and Hamburg, for Antwerp, having earned a bad name as an expensive port, was being shunned when possible by both shipowners and shippers, or receivers of merchandise. The present authorities here not being representative, it might be fair to say that they have not that interest in pushing trade that a municipal authority, having more of an interest in the town, would have.

2339. I think if you tell us what Antwerp has done that will be quite sufficient?—But the municipality, having the representations of those interested in this matter brought strongly to its notice, saw that another policy must be adopted, namely, the port charges lowered, and what other amount was necessary supplied by the municipality, and, as I believe in this case, assistance from the Central Government, with the

result that Antwerp now well holds her own with her rivals, Hamburg and Rotterdam. I therefore advocate the purchase of riverside property by the port authority, if one is formed, below the old Thames Tunnel at Wapping. When I say below, I do not mean immediately below, but it must not be above that, because over the Thames Tunnel there is only about 12ft. of water at low tides. There are miles of rickety old warehouse premises in suitable situation for the construction of deep water quays or jetties on the Antwerp plan, and there is no reason why there should not be an improvement on that plan.

2340. And do you think the docks should also be purchased?—I feel that that is a very difficult question, because it is difficult to arrive at a fair valuation, but I think that the unity of control is of sufficient importance for me to say that I should prefer that the new port authority purchased the docks. There might be another way suggested that, instead of entirely purchasing the docks, they should make the water of the docks free, and leave the dock companies in the position of a wharfinger.

2341. Have you thought out any distinct plan?—Merely that instead of buying the whole of the docks from the companies you should pay them a certain sum for making the water free, and then they could reconstruct their business and carry on business as wharfmasters. They ought to be able to do that as successfully as the wharfmasters in the river. They certainly would not be at a disadvantage as compared with the other wharfmasters, they would rather have an advantage.

2342. But you have not formulated any distinct plan for separating interests and showing how the thing could be done, have you?—I have made no valuation. I am not competent to make a valuation on that subject, and it would be a question of valuation.

2343. I do not think we will go into the historical portion of the statement of your evidence now?—I think I can give you some information as to the London and St. Katherine Docks. That is as to the amount of work that is done there. It is quite true that the London and St. Katherine Docks are full of work at the present time, but the point is this: it is not being done on payable terms. I submit that it is not, and I have certain evidence of my own on the subject. For instance, I was in treaty with the dock company to run steamers from the London Dock; they offered me a warehouse or shed there. At the time it was an open space; it was not then boarded off. It was under one of those tall warehouses supported by pillars. They said they would enclose that for me as a transit shed, and give me the sole use of it for a warehouse at a certain rent, and with regard to any landing of goods the profit would be mine and I was to run a certain number of steamers in and out of the dock free of dock dues, I paying a fixed rent; and I think you will find that until the dock began to get pretty full that was the case with other people. So that if a dock was started to do the sort of business that they are doing now it would mean a great loss. Of course, they are quite right to get what business they can. The docks were nearly empty for a long time, and then they took up this system of placing themselves in the position of wharfmasters, sub-letting to me, as they offered to do, a certain portion of their premises, and then I was just as free to come out as if I had gone to one of the wharves in the river.

2344. So that your opinion is that these docks are practically the same as wharves, and they are treated as such by their owners?—Yes. They do not levy their one shilling a ton dock rate, and therefore they cannot get that profit.

2345. Now will you go on to what you have to say about the river police?—I think it would be better that the river police and the dock police should be all under the central port authority. There is no doubt that there is a good deal of pilfering goes on during the loading and discharging of cargo. I have had painful experience of it myself. If the whole thing were worked under one system, the defective part of the matter particularly could be better arranged than it is at present.

2346. Then you think that the regulations for licensing watermen and lightermen and boats and barges should be in the hands of the Port Authority?—Yes.

2347. Then I see you desire to say something about the passenger steamboat service, but we consider that matter outside the scope of our inquiry?—I have brought that in because I thought the Port Authority would be considered as an authority to arrange with regard to labour.

See 562s.

See 562s.

See 562s.

2348. And you think that the dues ought to be levied by one authority?—Yes.

2349. And the same with regard to the powers to raise loans?—Yes.

2350. Then let us come to the question of port charges on tonnage, and whether London is an expensive or a cheap port?—As I say, the question can be answered both ways. Of course, you have had the evidence of the largest shipowners, who say that London, on its port charge tariff even, is not a dear port; but that it is much about the same, as far as the actual charges are concerned, as Liverpool, as was explained to you this morning. But two-thirds of the trade of London is in small boats, that is, boats under 1,500 tons. If you take the Report of the Board of Trade Commission in 1896, Appendix B, Table 3, page 8, you get there a list of vessels that have paid tonnage dues for the year 1894, and if you take those out, you find that vessels under 500 tons, including coasting, are 47·93 per cent. of the trade paying dues; vessels under 1,000 tons, including coasting, 61·11; and under 1,500 tons, including coasting, 69·87.

2351. Then do you say the system of discharging in the docks is also expensive?—Yes; the reason of that is that there are cargoes coming in mixed, some going into lighters. It is not that part that causes the expense, but in order to get his goods clear, if he does not land the whole of the cargo, he nearly always has to land a large quantity of it, in order to sort the goods to go by lighter or by cart, and those charges in London come upon the shipowners, whereas in some other ports, for instance, in Liverpool, the sorting, after the landing is done, is paid for by the receivers of the cargo. But taking London for the trade of these boats, saying roundly for the 69·87 per cent., London is a very cheap port, and it would be very detrimental to the Port of London, I consider, if dues were put on which would prevent its being a cheap port for that class of trade. That class of trade is, I may say, a trade that will expand or contract according to competition, in this way:—London is an enormous place, and a certain amount of feeding stuff and supplies for London must come in. That trade inwards London is bound to get, because people must have it. Then the other trade, in which the increase or decrease will take place, will be the transshipment trade from London and the distributing trade from London, which will go ahead or astern according as she meets that trade. When I first came to business, in 1864, there was a very much larger coasting trade than there is at the present time, the reason for that being that a great many of the ports which are now taking large steamers were not then suited to take them. Antwerp, of course, had not got her improvements, and we transhipped a good deal of foreign produce from London to Antwerp, which is not so frequent now. Then that cargo came in direct, and that trade which used to come to London and was then transhipped and went across to continental ports, as Rouen, Havre, and so on, improved, fell away. As the tendency now is for steamers of very large tonnage to be built, it will, perhaps, possibly alter again; these largest steamers will be confined to the very largest ports, and if London keeps herself to the front in that respect, this transshipping trade should revive or increase. But if you put extra dues on, it is just that kind of trade which is sensitive, and a very little thing will divert it elsewhere. That will apply also to putting harbour dues on goods to any great extent which I believe has been advocated, because London is used as a "dumping ground." Say a man has produce abroad to ship, and he has not a buyer for it at the moment, but he cannot hold it because he wants the money, he ships it to London, where he can always raise money on his bill of lading, and it is landed here and sold out in parcels after being warehoused, and so he realises his profit as the case may be. London has obtained a good deal of its trade on that account, being what we call a "dumping ground" for certain kinds of produce. High charges in London would affect that particular use of the port.

2352. Then you say Southampton is not a dangerous competitor now?—It seems to have reached its limit, but of course they may extend. I have certainly found that from 1893 to 1897 the increase of Southampton was 30 per cent., as against 15 per cent. for London.

2353. Might I ask whether you took the figures from the official returns?—Yes. I took them from the official returns of the Board of Trade.

4238.

2354. I think perhaps we need not go into that, because we shall have the figures ourselves?—Some of the figures I do not think you will have, because they require somebody to understand not only how the figures are put in—  
Mr. J. E. Matthews.  
— 29 Nov. 1900.

2355. I was just going to say that there are some traps in these figures?—Yes. I have corrected them, and I do not think that there would be many people who would have the information to correct as I have. I am a practical man on the water, and connected with the river.

2356. Then I think you might give us them as you have corrected them. This is a statement as to the entries and clearances of shipping at different ports in the years 1897, 1898, and 1899?—Yes.

2357. These figures are taken from the official returns of the Board of Trade corrected by your own information?—Yes.

2358. Will you state the substance of what these figures are. First of all you will speak of clearances?—Yes. Bristol: In 1897, 1,471,000; in 1898, 1,514,000; in 1899, 1,525,000; showing an increase of 3·5 per cent. Liverpool: In 1897, 8,986,000; in 1898, 9,352,000; in 1899, 9,369,000; showing an increase of 4·9 per cent. London: In 1897, 8,992,000; in 1898, 8,513,000; in 1899, 8,250,000. These are the figures that I have corrected. On the face as I read they would show a 9 per cent. decrease, but by correction of these allowances for ballast and estuary trade, which was not formerly included, it is in fact a half per cent. increase. In the previous period London had increased 15 per cent., and for these two years she has increased half per cent. I will hand in a table showing how I arrive at that increase of half per cent.

(The Witness handed in a table showing the coasting clearances and entries of tonnage in the Port of London for the years 1897, 1898 and 1899. See Appendix, 7th Day, No. 1.)

2359. And that is allowing for everything?—Yes, allowing for everything. That is a net increase. Then Southampton: In 1897, 2,669,000; in 1898, 2,591,000; in 1899, 2,657,000, showing a decrease of 0·5 per cent. Glasgow: In 1897, 3,665,000; in 1898, 3,964,000; in 1899, 3,885,000, showing an increase of 5·6 per cent. Then I go to the entries. Bristol: In 1897, 1,510,000; in 1898, 1,516,000; in 1899, 1,556,000; which is an increase of 3 per cent. Liverpool: In 1897, 8,928,000; in 1898, 9,394,000; in 1899, 9,468,000—an increase of 6 per cent. London: In 1897, 16,017,000; in 1898, 15,287,000; in 1899, 15,388,000. That is an increase on the two years of 2 per cent. That is the corrected figure instead of on the face figure a decrease of 4·9 per cent.

2360. You say there is a real increase of 2 per cent., while the figures show a decrease of 4·9 per cent.?—Yes. Then Southampton: In 1897, 2,767,000; in 1898, 2,704,000; in 1899, 2,784,000; showing an increase of one per cent. That may be explained somewhat in this way. During the Spanish-American War the American Line steamers were withdrawn from Southampton, which made some reduction at Southampton. Then Glasgow: In 1897, 3,408,000; in 1898, 3,710,000; in 1899, 3,550,000. That is an increase of 4 per cent.

2361. Then your final conclusion is that if anything is to be done to save the trade of London it is quite evident that prompt action is necessary?—That is so.

2362. Is there anything else you would like to add?—I would like to add with regard to these figures that any statistics in which the value of imports and exports is mentioned are very unreliable. I can give you evidence on that point. I have been through everything of this kind of business from office boy to my present position.

2363. As between port and port?—I mean this: you cannot depend on any valuation given by any Board of Trade statistics on free goods. For instance, I have been a Customs House clerk after I first was in the City. When I had to pass an entry of free goods I had to fill in the value. If I did not know the value, I made it, and I have no doubt that that is done by Customs House clerks now. I did not want to go back to the office and have another journey.

2364. Have you any information to give as to any particular trade where you think the Board of Trade information is untrustworthy?—No, I have not studied it closely enough to say that, but I have talked on the subject with others who have made out these entries, and so on, and I know that they are put down very haphazard.

2365. Of course you know that all this has been discussed from time to time during the last 30 or 40 years, and the Customs House have imposed a fine upon people for imperfect returns and false returns, and that the matter is one of continual investigation?—I see.

P

*Mr. J. E. Matthews.* 2366. You are not aware of the public discussions that have taken place with regard to this?—I have not been fixed.

29 Nov. 1900. 2367. (*Sir John Wolfe-Barry.*) Are the pilotage laws any different in the Thames from what they are in other rivers as to responsibility and matters of that kind?—I have withdrawn that matter of responsibility.

2368. But they are really no different, I suppose?—No; nowhere are the pilots responsible in that way.

See 20-21;  
7544-5.

2369. Now with regard to the moorings. The Thames Conservancy say they make no charge for moorings. Who does make a charge for moorings then, other than the private owners of moorings?—A man comes up and demands money from me for steamers mooring at certain moorings in the Pool. If I do not pay that money he says, "I shall put you in the police court," or "I shall go to the solicitors of the Thames Conservancy," and he will sue me at once for that amount. I am informed that the moorings belong to the Thames Conservancy, but that these men have a right to charge, and they always threaten us with the Thames Conservancy if we object to pay the amount. If we think it is too much, in the interests of one of the ships that are sent to us as shipbrokers, we object to it sometimes, and we are continually threatened with proceedings if we do not pay. We have in some cases got the amount reduced. I have a list of cases here, which I picked out hurriedly, of amounts I have paid for certain ships. I believe the Thames Conservancy have stated that there is no charge made for moorings, but that is incorrect.

2370. The Thames Conservancy told us that they made no charge for moorings?—They actually said further than that, that there was no charge made for moorings, as I heard it.

2371. Then do you suggest that there is a middleman comes?—Sometimes three middlemen.

2372. And they make charges against the shipowner for using the moorings which are not charged for at all by the Thames Conservancy?—Yes. The Thames Conservancy get nothing out of it, I understand.

2373. Can you give me any idea at all how these men arose; who they are; or where they come from?—There are so many antiquated things connected with the Thames Conservancy that they develop out of some old plan, or old system, when it was in the hands of the previous port authorities, or at the time the City Corporation had it, that I expect they will find a difficulty in explaining it themselves. The thing has gone on so long that I doubt if they know whether the moorings belong to them or to somebody else.

2374. At any rate the broad result is that the ship-owners have to pay somebody for their moorings?—Yes, and the difficulty is that there is no fixed tariff, and there is continual friction and bother with these men, who, when they get a stranger, immediately charge him more. He comes up to me as shipbroker and says, "Am I to pay for it?" I look at it, and if it is more than I have paid before, I say "No." Then the man comes up and threatens proceedings unless we do pay him. In some cases we have referred to the Conservancy. In one case, on the 5th April, 1899, a man refunded some money for a small steamer called the "Argowan."

2375. (*Sir Robert Giffen.*) Can you tell us on what ground they make the charge?—I have never thought it out. I felt very much inclined to take it into Court, but I have not done so. It has always been very annoying to me, having to deal with small ships.

2376. How do they describe themselves when they make the claim?—One of them calls himself a "chain lighterman," but he makes the charge for moorings, and not for doing work. "To moorings," so much.

2377. (*Sir John Wolfe-Barry.*) Can you tell us how much the charges are, and whether they vary from time to time? Can you put in any paper relating to these charges for moorings?—The charges seem to run from 10s. to £1.

2378. Per day?—No, for the mooring.

2379. For how long?—They are generally there four or five days.

2380. (*Mr. Ellis.*) For as long as the vessel is there?—Yes.

2381. (*Sir Robert Giffen.*) Is that one of the bills you have in your hand?—No; it is only a memorandum of my own, putting down the dates and the amounts I paid for certain steamers.

2382. (*Sir John Wolfe-Barry.*) I think you told us that you thought that quays deep enough for overseas vessels should be alongside the Thames. Is there anything to prevent that being done now, except the expense?—It can only be done in conjunction with deepening the channel. If I owned private land, wharfage property, and if I made a big quay there, it would be no use unless the port authority made me a channel up to it.

2383. But even with the existing channel there are several wharves deep enough for sea-going ships to go alongside, are there not?—For the trade of two-thirds of the port, yes.

2384. Take the Aberdeen vessels, or the Dundee vessels?—Yes; they have their own wharves.

2385. And the sea-going vessels going alongside can take in their cargoes?—Yes.

2386. The General Steam Navigation Company have also wharves for sea-going vessels?—Yes.

2387. Is it not therefore really rather a matter of expense whether the wharfinger goes to the expense of making the water deep enough?—When it comes to the modern trade for these steamers that go to Antwerp, it is another matter.

2388. It would be more expensive, and the expense would not be warranted unless there was a channel?—Yes.

2389. That is really the state of things?—Yes.

2390. There is nothing to prevent it being done?—No.

2391. And up to the present time a number of wharves have been made deep enough for sea-going ships up to the limitation of the depth of the channel?—Yes. You get good, fair-sized boats right up to London Bridge.

2392. Is not one of the great reasons why more deep water wharves have not been made the fact that the business has been carried on so much by lighters, who take the cargo out of the dock and bring it to the wharf?—Yes. Of course, it would decrease the quantity of lighters very materially if we had a system like that at Antwerp, and the steamers came alongside and discharged there.

2393. Is not the reason why people do not go to the great expense of making the deep water quays in London to be found in the fact that so large an amount of business is transacted by the lighters going into the docks, taking the cargo from the ship and bringing it into wharves?—Yes.

2394. The ship must either go into the dock or lie in the river?—Yes.

2395. Then if it lies in the river its cargo would be taken by lighters?—Yes.

2396. And a wharf that is suitable for lighters costs very much less than a wharf that is suitable for sea-going vessels, naturally?—Yes. I might mention something with regard to the working of the Port of London as compared with the working of the Port of Cardiff. We have a wharf at Cardiff.

2397. (*Mr. Ellis.*) Would you be speaking of your own experience?—Yes, we can do our work very much quicker there than we can in London.

2398. (*Sir John Wolfe-Barry.*) You are talking of general cargo, of course?—Yes, we run coasting steamers between London, Cardiff, Llanelli, and Swansea. At Cardiff we hire a wharf off the Bute Docks Company. We have the sole use of that part of the dock. We have a long transit shed with three openings in it, so that we can run gangways from the steamer's rail. Say we have three hatchways, we can run three gangways from each hatchway into the sheds at different points. These sheds are raised about the height of this table from the ground level, about the height of the tailboard of a cart. We can perform four operations at the same time. We have just room for a single line of rails with a loop rail, every now and then, where you can shunt—a single line of rails between our shed and the water side, where the steamer lies. We can get in railway trucks between our gangways, or outside them at the ends, and we have a door on the other side of the shed where the cart waits with its tailboard against the little gangway for it to back into. Then we erect a little platform on the steamer just where its gangway is, and we lift our cargo on to there. The cargo is run at once in trucks. If it is to be warehoused it turns up into the warehouse. If it is to go for distribution into the town it is wheeled straight into the cart, and, when that cart is loaded, away it can go. If it is to lighter, it can go on the opposite side. If it is to be transhipped into another dock for abroad then

it goes away in lighters, or sometimes it goes up the Glamorganshire Canal, and then it goes into lighters; or we put it into a railway truck, as the case may be. Into lighter, railway truck, for warehousing, and wheeled direct into carts; all is going on at the same time. Consequently, we can turn over our cargo there very much more rapidly than we can here.

2399. You have plenty of space there, in fact?—Yes.

2400. You say you are acquainted with Antwerp?—Yes.

2401. Can you tell us whether Antwerp is served by the Government railways?—The Government railways run into Antwerp, but I do not know that they have it exclusively. I expect there is connection with the other lines.

2402. But the Government railways do run in there, do they not?—Yes.

See 2358-  
(10). 2403. You gave us a very interesting statement about the various percentages of increase, and you quoted the Table on Page 8 of the Report of 1896. Have you been able to carry that table as far as 1899?—I do not think I quoted that as regards the increase of trade. I quoted that in reference to the quantity of tonnage under 1,500 tons and over 1,500 tons. I have not carried it any later.

2404. Up to the period quoted there, 1894, there is a large increase in the tonnage of large ships, is there not?—Yes.

2405. And the percentage is very rapidly increasing?—Undoubtedly.

2406. And I suppose you would be disposed to think, apart from absolute statistics, that that increase is going on still?—I feel that it is. That is why it is that, although I am connected with small ships myself, I feel that I am just as much interested in making the port suitable for these large boats as anyone else; because if we exclude these large boats we diminish the trade, and we diminish that trade of transit and transhipment that we small people are depending upon.

See 2358. 2407. Then, if the table that you have put in indicating a very small increase in the total tonnage of London is to be taken account of is true, that must indicate a decrease in the small tonnage, because we must all admit that there has been a large increase in the tonnage of large ships?—Yes.

2408. The small tonnage is going down, and the large tonnage is going up, if the total tonnage remains approximately the same now?—Yes. I should say that it is in the transhipment trade that that loss has been made, or that loss of expansion.

2409. And that transhipment trade, in which many people in London are interested, will further decrease if the large ships cannot come to London?—Yes.

2410. And if they do not have the fullest facilities for coming to London, the small ships will suffer in their trade?—Yes, that is my experience.

2411. (Mr. Ellis.) You have had 35 years' practical experience?—Yes.

2412. And you come before us both as a shipbroker and a shipowner?—Yes.

2413. May I ask if your brokerage business relates to many classes of goods, or is confined to a few?—It is very varied. We do coasting business—almost the smallest coasters—and we do North American business in chartering. Those are the largest boats we deal with for merely chartering; but the boats we have coming in to London are from the Baltic, the Continent, and the Mediterranean. We have grain steamers from certain ports. We have a good deal of grain and wood from the Baltic.

2414. I think that I understand that your ship-owning interest attached rather to smaller vessels?—Yes.

2415. Have you a large fleet?—No; we run about two boats a week between London and South Wales.

2416. Are you appearing before us as a representative witness, or as speaking in your individual capacity?—I speak in my individual capacity.

2417. You are also a representative on the London County Council of a riverside district?—Yes.

2418. You said in your evidence: "At the time I am writing steamers with wood cargoes are waiting six to eight days outside the Surrey Commercial Docks for permission to enter owing to congestion of traffic." Is that

within your own knowledge?—I had a boat at that time which was kept eight days.

2419. Does that mean now?—I suppose that would be three weeks ago. There was a boat kept eight days on one occasion, and I knew there were other boats kept five days.

2420. I only want to get your own knowledge?—That is direct evidence.

2421. Then as to the inequalities of the pilotage tariff, do those arise within your own personal experience?—Yes.

2422. Have any representations been made by your firm, either as brokers or shipowners, with regard to that matter?—I believe this matter came up, and I believe there was a commission upon the pilotage matter. I know my father sent in his evidence, but he was never called.

2423. That would be many years ago?—Yes.

2424. That is rather ancient history?—Yes.

2425. Can you give us anything more recent?—I do not know how we can represent. It is no use making representations to the Trinity House.

2426. I am not asking you how you can do it, but I am asking you if it has been done?—I cannot bear in mind that I have made any representation. I should not have known exactly how to set about it. Seeing that this Commission was appointed I took the opportunity of mentioning it.

2427. But you were rather waiting for an opening?—Yes. This subject of the inequalities has been very much in my mind for a great many years, and I have been glad of the opportunity to say something about it.

2428. Turning to the Tilbury docks, do you think they are too far by rail and cartage? Have you any personal experience of these docks at all?—Yes, I know Tilbury Docks well, and the state of the docks too. The pier on this side of the dock is in a very bad state. I have personal evidence of that.

2429. Then you do not concur with what other shipowners have said. I put it to them that if the railway communication was perfect, would they be satisfied? I put it assuming there was no complaint of the railway communication between Tilbury Dock and the warehouse, would they be satisfied?—I think it is the best dock in London if it were not for the distance, but I mean there are structural defects; there are cracks in the masonry.

2430. You do not mean that if the railway communication were perfect it would be too far?—The amount charged is too large. In the grain trade they would not take cargoes there. They would not consign contracts for delivery in Tilbury Docks.

2431. Do you think the distance of the Tilbury Docks, railway communication being perfect, is still a bar?—No, not with cheap communication. With cheap communication I should not think it was.

2432. It all depends on the rate?—Yes, it depends on the rate and the communication.

2433. Then you made an interesting comment on the phrase "cheap port and dear port." You pointed out that in one aspect London may be described as a cheap port, and in another aspect as an expensive port?—Yes. See 2350-1.

2434. That you adhere to?—Yes.

2435. It is not correct to describe it as a dear port, or as a cheap port, but you must take it from the particular aspect?—Yes.

2436. I think we gather clearly that although your interest lies chiefly in smaller vessels, you wish the thing to be regarded from the point of view of all?—Yes.

2437. Large and small indifferently?—Yes.

2438. Then again you made a very interesting comment about Antwerp. You indicate to us that the municipality supplies some funds and the central government supplies some funds. Have you the same thing at all in your mind, speaking as a member of the London County Council, with regard to what ought to be done with the port and docks of London?—I am not authorised to speak on behalf of the London County Council. See 2336-9.

2439. You are speaking purely as an individual?—Yes, purely as an individual. I think if money is sup-

*Mr. J. E. Matthews.* plied that it would be the way in which it would have to come. It would have to come through the County Council, or through the County Council and the Corporation.  
29 Nov. 1900.

2440. At all events, speaking as a representative of the ratepayers, which you are?—Yes.

2441. You see no difficulty personally. It is a very important question?—Of course, the question of rates is one that always affects the ratepayer, and it is one that is always not a popular one, but I think that London would be benefited by the increased trade of London and the improved port, and I think London should pay for it.

2442. You will understand that I am not wishing to

extract any answer from you at all. I wish you to give your view?—That is the view that I have arrived at. I think it would be fair that in some degree some money should be supplied by the rates. I believe that in Antwerp something like two-thirds is supplied by the Imperial Government and one-third by the municipality.

2443. And on the ground that you have stated, that the community benefits?—Yes.

2444. (*Sir Robert Giffen.*) Have you any opinion as to whether the Exchequer should contribute as well as the County Council?—Yes, I certainly think it should.

(*Mr. Ellis.*) That goes without saying, but I put it not from the Exchequer point of view.

Mr. WILLIAM MARTEN SMITH called and examined.

*Mr. W. M. Smith.*

2445. (*Sir Robert Giffen.*) You are a member of the firm of W. M. Smith and Sons, wharfingers and general warehousekeepers?—Yes.

2446. You carry on business at Smith's Wharf, Queenhithe?—Yes.

2447. Where is that wharf situate?—It is above Southwark Bridge, on the north side.

2448. Your firm handle chiefly East India and China produce?—Yes.

2449. You are the Chairman of the Wharfingers', Warehousekeepers', and Granarykeepers' Association of the Port of London?—I am.

2450. How many members are connected with that Association?—There are 36 actual members, as far as I can remember at the moment—that means firms, of course.

2451. And I think they represent something like 67 wharves?—Yes, that is so.

2452. Will you give us your evidence please?—My Association on receipt of letters from the Secretary to the Commission, indicating points upon which they desired this Association to furnish evidence, took steps to procure same by circularising not only members of this Association, but also all other wharfingers from Westminster Bridge down to Greenwich on the south side of the river, and from Blackfriars Bridge to Silvertown on the north side. About 320 circulars were sent out to the different wharfingers and others, to which 124 replies were received, so that it has been impossible to procure all the information desired. I hand in a schedule showing the names of the firms so circularised, with the addresses, and the gross and rateable value of each wharf, together with the distance of such wharf either above or below London Bridge. The assessments are those given in the new valuation lists. At the end of this schedule will be found a summary indicating the total number of wharves within two miles above London Bridge, and of eight miles below London Bridge, together with the total gross and rateable assessments within a distance of each separate mile. The schedule includes all the Sufferance wharves and Legal quays, a list of which has already been furnished to the Commissioners by Mr. Fleming, of the Customs.

(*The witness handed in a schedule of wharves and waterside premises, with gross and rateable assessments, from Westminster Bridge to East Greenwich on south side, and Blackfriars Bridge to Silvertown on north side of river. See Appendix, 7th Day, No. 2.*)

2453. The information in this schedule relates to all the wharves?—Yes.

2454. Not merely to those who have given you replies, but it relates to all the wharves?—All the wharves within that distance on either side.

2455. Will you give us the substance of this schedule? I should like you to give us one or two points out of it that you think important?—I could give you the summaries to which I refer.

2456. What is the total gross value?—The total gross value is £415,005.

2457. What is the net rateable value?—£332,722. That is arrived at by setting forth the assessments within the different distances of miles north and south.

2458. The greater part is within the distance of two miles?—Yes, it would be.

2459. The total gross value within a distance of one mile is £103,500?—Yes.

2460. The total rateable value is £35,800?—Yes.

2461. Beyond that, but still within a distance of two miles, the gross total is £26,812, and the rateable value is £20,560?—Yes. That is above London Bridge.

2462. Will you give below London Bridge as well; will you state us the same figures?—Within the one mile area the gross value is £147,135, and the rateable value £119,278. Within two miles the gross value is £58,340, and the rateable value is £47,666.

2463. Beyond that of course the figures are somewhat smaller?—Yes, they diminish right away.

2464. This is information relating to all the wharves, See 7465- and not merely to the 124 who have replied?—Yes, to all the wharves throughout the whole length of that distance. The wharves to which the 124 returns apply are of the total gross assessment of £238,486, and total rateable assessment of £197,057. The difference between the classes of wharves in regard to privileges, or legal status, has already been explained by Mr. Fleming. As to the aggregate length of quay accommodation at the wharves, it is shown from 110 returns to this question that the total length of river frontage occupied by such 110 wharves is 16,688 feet. Respecting the point as to "what proportion of wharves have depth of water sufficient for sea-going ships of varying depths of water to lie alongside," only 57 wharves made any return, with the result that these have depth of water varying from 10 to 30 feet.

2465. (*Sir John Wolfe-Barry.*) Does that mean at low water, do you know?—I think not; I should say it is at high water for the wharves; that is my impression certainly.

2466. You would not call 10ft. at high water sufficient for a sea-going ship?—No, not for sea-going ships. It was in reply to that question—we made application and that was the result; some wharves have only 10ft. at ordinary high water. As to warehouse accommodation, the returns to this question show that 95 wharves have a floor space of 10,163,206 superficial feet, five others make a return of 2,266,365 cubic feet, and five others (principally in the case of granaries) make returns showing a storage capacity of 25,800 tons. All the wharves have some kind of mechanical equipment. Of those making a return it appears that 69 wharves have hydraulic equipment, 10 wharves electrical equipment, 72 wharves steam equipment, and 22 wharves gas equipment, while some have both hydraulic, electric, steam and gas. In the majority of returns made the wharves appear to have either two or three forms of the above equipments. As far as this Association is aware there has been no difficulty about sufficient wharf and warehouse accommodation in the port. As business has increased the wharfingers have rebuilt or improved their premises to meet the increased demand of trade, and the natural law of supply and demand has had full play. From the replies received firms representing 77 wharves appear within the last ten years to have reconstructed or altered their premises at a total outlay of something like £1,084,570. The estimated amount of capital invested in premises, and the estimated value of such premises in the Port of London is a matter of considerable difficulty to arrive at. Many wharfingers object to give details under this head. The total sum estimated to be employed, both fixed and floating, in the businesses of wharfingers from 99 returns made, show a total of £7,830,758. As to the quantity of goods received at the wharves, 103 returns made show that the tonnage of goods received at these premises during the last 12 months amounts to something like 3,079,280 tons. Wharfingers receive all kinds of goods, and some acquire a business of a particular type. It is impossible to give further par-

ticulars under this head. Flour, rice, and grain in particular are very largely dealt with and stored at riverside wharf premises. Generally speaking, it is obvious that the wharves and granaries have, and always will possess great importance to merchants, from the fact that goods are warehoused in close proximity to the City and the markets. There is a general complaint amongst wharfingers of the difficulty experienced in getting overside delivery, and also as regards the lightermen. It is a general opinion, I think, amongst wharfingers that the privilege at present enjoyed by the Freemen of the Watermen's Company of acting as working lightermen is one that should be abolished, as it restricts the supply of men for the service required, and in a way which is extremely disadvantageous to the employers of their labour. Speaking for our Association, I have not heard any complaint of inadequate accommodation for the storage of "dutiable" goods. There is, as far as I know, ample accommodation for dutiable goods, where such accommodation is required by merchants and others. The matters generally affecting the wharfingers are the frequent delays in the discharge of cargo. These delays arise mainly from want of sufficient quay space for the delivery of goods into craft as they are discharged from the ships. As a consequence it sometimes happens that delivery cannot be made into craft until the ship is unloaded and has been moved from her berth. These observations, however, do not apply equally to all docks or stations. We object to any provision that would throw an unequal burden upon merchants and traders importing goods, arising from the exercise of their legitimate rights as to the disposal of the same, and, therefore, especially to the proposed restrictions as regards the free water way of the port, which has been secured in every Dock Act which has been passed, and was made a condition of granting the privileges and facilities under which the docks were established. We consider also the terms proposed to be enforced in the Bill recently introduced into the House of Commons, even if there were any just ground for the demand, onerous and oppressive, as they would impose a charge on lighters and goods which would on an average be equivalent to the cost of lighterage. We say, however, that no service is rendered upon which such a charge could be fairly claimed. We consider that the traders of the Port of London should not be subject to these recurring attempts to re-open and set aside a settlement which has been solemnly confirmed in every Act of Parliament since the docks were established, and upon the basis of which their privileges were granted. The abrogation of this condition would be a manifest injustice to the owners and occupiers of wharves which have been re-erected, maintained, and increased on the faith of the promises of the Acts governing the regulation of the docks, and confirmed from time to time by Parliament. The remedy for some of the existing grounds of complaint would be—(1) An improvement in appliances and accommodation for the discharge of ships, and the delivery of their cargo. The system of jetties at the Victoria Docks appears to be the most satisfactory and expeditious; and the methods adopted in some parts of the Tilbury Docks give similar facilities. (2) The placing of the waterway of the river and also the docks as forming a part thereof, under the control of a central authority—possibly the Conservancy—with enlarged powers, and increased means. This would appear the more necessary, because the required improvements not only consist in better dock accommodation, but also, and perhaps especially, in a greatly improved waterway and approach to the port. The call for reformation arises not so much from an increased trade, but from great changes in the methods of trade, the altered and enlarged construction of ships to meet present requirements. It is not possible that a mere trading corporation can be called upon to perform the required works, which are, so to speak, municipal in character, even if they had the means at their command, as they would be for the benefit of the whole trading community, and are demanded in order that London should maintain its position as a great trading centre.

2467. (*Sir Robert Giffen.*) Is there anything you wish to add to that statement?—There is nothing I wish to add; I am ready to answer any questions if you have any to put.

2468. We hardly propose to ask you any questions on the subject of the proposals for increasing dues that have lately been made, as that is a subject we propose to deal with later. You must therefore take it that

your evidence on that subject, although we do not ask questions about it just now, is reserved for later consideration?—Then you do not wish to trouble me any further now?

2469. We have some questions to put as to the information which you have given. With reference to the capital invested, which you derive from 99 returns, you say that these 99 returns show a total capital invested of £7,831,030?—Yes.

2470. Looking at the proportion of rateable value of those who have made returns compared with those who have not made returns, do you think that this sum might be doubled as the value of the capital invested in the wharves of London?—One would require to look through the wharves that have not made returns; it possibly might be so.

2471. You said that the 124 returns which you have received include a rateable value of £197,000, and the total rateable value of all the wharves put together is £333,000, but these returns as to capital invested relate to a still smaller number than the 124?—Yes.

2472. So that it would seem that a very large part is omitted in these 124, and still more in these 99 returns?—Yes.

2473. You would not like to make a statement as to whether it would be proportionate in any way?—I do not think it would be doubled; I do not think that that which is not returned will be equal to what we have returned; at least, I should judge not, judging from the character of the property itself. What I said just now was that I could not tell positively without looking through to see which were omitted in the returns.

2474. You would have to make a considerable addition in any case?—Oh, yes, a very considerable addition.

2475. Do you think you could give us further information, to the best of your ability, upon these points upon a subsequent occasion?—I am sure I could.

2476. Will you endeavour to do so?—Yes, I will, with pleasure. What you require is that, looking at the rateable value, and so on, of the property which has not made a return of its capital, we should estimate about what worth it might be.

2477. The best you can give, or whether you think it would be a considerable sum; the best that you can do?—Yes.

2478. (*Rear-Admiral Hext.*) With reference to what you said as to "The placing of the waterway of the river, and also the docks as forming a part thereof, under the control of a central authority." By that do you mean a trust?—It might be a trust.

2479. Would you advocate a trust or a board similar, say, to the Mersey Docks and Harbour Board?—My idea in that was that if the Conservancy had the powers, and if they were to carry out the dredging of the river in order to give a deeper channel, as the water of the docks and the river we consider to be one, it would perhaps come under such an authority as theirs; but I do not mean to say necessarily it should be the Conservancy, but some trust or some body with Parliamentary authority to carry out the work.

2480. Would you propose to put wharves also under the control of such a body?—It is the waterway and the access to the ships in the Port of London that I am looking at. I have no wish to put the wharves or the dock warehouses under the authority. My idea there is simply the waterway and all that appertains to it.

2481. Now with regard to barges. Do you not think that they gain great advantages from the still water of the docks in loading and unloading in safety over performing the same work in the river?—You can hardly compare the work that they do in the river with that which they do in the docks, because if there is a ship in the river it is small enough to lie in mid-stream, or so near mid-stream that they can very easily come alongside and take away their goods. In the docks with these large ships, especially that we are now getting into the Port of London, you require, of course, necessarily a larger number of craft, because the ship requires that every craft should be in attendance. It is better, of course, lying in the still water of the docks.

2482. What I want to arrive at is whether you do not consider that the facilities for the barges carrying on their work are greater in the docks than in the river?

Mr. W.  
M. Smith.

23 Nov. 1900

2511.  
and 2649-50.

Mr. W.  
M. Smith.

working in a tidal river?—Yes, I think probably they are.

2483. (Mr. Ellis.) You said: "The matters generally affecting the wharfingers are the frequent delays in the discharge of cargoes." Then you pointed out the reasons for the delays, and then you continued: "These observations, however, do not apply equally to all docks or stations." Could you at all indicate where they do apply to them?—I rather indicated that a little later on when speaking of "An improvement in appliances," and I referred to the jetties in the Victoria Docks as being an admirable plan.

2484. Those are admirable, but where is it that they are not admirable?—They are not admirable wherever there is insufficient room given for the berth of the ship and the simultaneous loading in the craft of goods coming out of the ship.

2485. I want to get out where the shoe pinches?—It is unnecessary, I apprehend, in any one of these docks really. It occurs, say, in the Albert Dock where a ship is put alongside if she is a very large vessel, and she is berthed close to another ship, and there is no space there for the craft.

2486. I want to fix it geographically if I can. You said: "These observations, however, do not apply equally to all docks or stations." Can you tell us where the shoe pinches worst?—It pinches worst in the Albert Dock, where the accommodation for the ships and the craft combined is not sufficient, that is to say, in quay space. But I was going to say, if you will allow me, that over and over again we do have the accommodation in the Albert Dock so as to go on simultaneously loading in the lighters, which is an immense advantage in unloading ships. The sheds are not blocked up in the way they otherwise would be; very often, in eight times out of ten, or nine times out of ten, we are going on loading simultaneously where there is quay room. Where the delay occurs is where there is not that quay room for the craft to receive the goods as they come out of the ship.

2487. Where is that?—The Albert Dock really is the largest dock we have, and almost the principal dock for these large ships, excepting Tilbury.

2488. Does it apply in any other dock?—It does not apply in the same way. If there were more quay space allowed in the Albert Dock for unloading the ships, it would make a great deal of difference.

2489. Then it mainly applies in the Albert Dock?—It does as far as my experience is concerned certainly.

2490. (Sir John Wolfe-Barry.) I noticed that you lay considerable stress upon proximity to the City?—Yes, that is so.

2491. Does that apply, in your judgment, to the docks as well as the wharves?—It would apply to the nearer docks.

2492. Would not the inconvenience of being as near to the City as possible apply as much to the docks as to the wharves?—Yes, certainly, the nearer docks and the dock warehouses as well; they are most conveniently placed.

2493. As near as can be, having regard to the sea access to ships?—The dock warehouses we are now speaking of are not near to the river at all, but wherever it is possible that trade requires that the goods should be brought up as near to the City as possible; that is an advantage to the merchants.

2494. I did not know whether your answer applied to bringing goods up in ships or in lighters?—That is really as against the necessity of bringing goods up in lighters. The docks themselves are obliged to lighter up a great quantity of their goods, because they must bring them to the City.

2495. That leads me to ask you this question. Can you give us the relative cost per ton of lightering from Tilbury as compared with lightering from the Albert and London Docks?—You might put on 25 or 30 per cent certainly, but we are in this difficulty, if you will allow me to explain. Where you have ships in the Tilbury Docks, a lighterman requires that he should be paid a minimum charge, and if the minimum charge is not covered by the tonnage on the goods, you are very much at a higher cost in regard to the Tilbury Docks, because the minimum charge in the Tilbury Docks is very much higher than that in the Albert Dock.

2496. Could you put it into money per ton?—Not exactly; it is very difficult. Being a minimum charge

it might be a small quantity of goods you are bringing up, and the percentage per ton might be very high.

2497. That would be for a separate parcel. I wanted to get it rather as a matter of experience over the whole of your business?—I can only speak of my own business in regard to that. I am not aware precisely what other wharfingers may be paying, or what their arrangements are; I should say from 25 to 30 per cent.

2498. More for all lightered up from Tilbury?—Yes.

2499. Can you give us any price per ton as an average price on which to calculate the 25 to 30 per cent.?—Not to cover all prices of goods, because they are very various.

2500. Can you give me an average of your business?—Somewhere about 3s., if you take the Tilbury Docks and the maximum charges into account.

2501. 3s. from Tilbury?—Yes.

2502. Do you mean 25 per cent. less than 3s. from the India Docks, or the London Docks?—I beg your pardon—not from Tilbury; I thought you were asking me the average price I should have to pay, including Tilbury. Tilbury would run more like into 3s. 6d. with the minimum charges, and perhaps about 2s. 6d. for the other docks.

2503. Approximately, merely for the sake of getting some figure—about 1s. a ton more?—Yes.

2504. Is that 1s. a ton more in gross weight or by measurement?—Gross weight.

2505. Can you give us any information as to the percentage of goods either from the wharves of the association represented by you here, or from your own wharf, which eventually find their way on to the railway trucks of the country?—For delivery through the country?

2506. Yes, away from London. What is the proportion of goods which is delivered in London and consumed in London, as compared with what is sent away by rail?—Very little of that which wharfingers handle would be sent away by rail. Wharfingers only occasionally have an order from their merchant to send off a certain lot of goods that he might be in a hurry to send off by rail, but for the most part they move it up to their premises.

2507. That is not my point. Having got the goods into your premises, what proportion goes away direct out of London for consumption in what we call the provinces, as compared with what is carted and consumed in London?—That is rather a difficult question. You say "consumed in London." The greater part of what we receive goes away by land; I am speaking now for my own wharf. There is a little to be shipped off which has to go for transshipment, or to be shipped for some foreign vessels, but I really could not answer the question in regard to the quantity that is sent away into the country, because we do not know the destination. We deliver simply to the wagons or carts that are applying for the goods, and we do not know the destination at all.

2508. You do not know how much goes to the various railway stations and how much does not?—No, I cannot tell you that off-hand at all; it will take a long time to find out. I could tell where railway carriers have taken away goods, but I do not know even then if they are going into the country.

2509. Is there any possibility of getting a return of that sort?—It would be very difficult.

2510. It is an important question?—We will endeavour to do so; we will make inquiry to see if it is at all possible, and furnish you with it if we can.

2511. It is rather an important question to find how much goes by rail from the Port of London and how much is used within the ambit of London?—I have an impression in my mind, but I should not like to speak off-hand, because it is not evidence—it is merely a passing impression. We will bring it before the association, and see whether our Secretary can in any way get it out.

2512. If you can give us some approximate figures, I think it would be very useful?—We will endeavour to do so.

2513. The Commission is sitting for some time, you understand?—Thank you, I quite understand.

2514. You said: "These delays arise mainly from want of sufficient quay space for the delivery of goods into craft"?—Yes.

2515. Does that mean that the goods are first of all put on to the quays, and then put back into the

craft?—There are two ways in which they are delivered to us. Some go over-side.

2516. Without going on to the quay at all?—Without going on to the quay at all. A great deal sometimes does. It depends on circumstances. I am speaking of quay space; it has to have room, and that a craft may be lying alongside, then, as the goods are landed alongside on the wharf, they are put into the craft.

2517. At one operation, do you mean?—Yes, it is common, wherever they can possibly do it, to lift the goods out of the hold of the ship and on to the quay, and then to drop them into the craft, and they are out of the way at once. Wherever that space can be afforded there is rapid delivery; we get the things up then within three or four days, or at most a week.

2518. Are we right in assuming that at the present time, if that operation is carried out, the wharfingers pay nothing for the use of the quay?—The ship uses the quay and pays for the use of the quay under the bill of lading.

Mr. HUGH COLIN SMITH called and examined.

2524. (Sir Robert Giffen.) You are a Director of the Bank of England?—Yes.

2525. And you have been a Governor of the Bank?—Yes.

2526. You come here as a partner in the firm trading as "The Proprietors of Hay's Wharf," who are the lessees of Hay's Wharf and Dock, Beal's Wharf, and Cotton's Wharf, wharfingers, master lightermen, carmen, etc.?—Yes.

2527. You have been engaged in this business for many years?—Yes.

2528. You have prepared some evidence for us, I think, which we should like you to give now?—The appointment of the Commission arose from the fact of the dock companies bringing Bills into Parliament to relieve themselves of expenditure they were no longer able to bear, and I venture, therefore, first of all to tender evidence that there are great exaggerations in their statements on this head. If there were no wharves and no lighters, the dock companies could not accommodate the business which comes into the port, and their own lighterage, bringing goods from the lower docks to the warehouses of the upper docks, far exceeds the lighterage of any other establishment. They, therefore, benefit by the expenditure necessitated by lighters frequenting the docks as much as their competitors. Nothing of late years should have tended more to bring back prosperity to the dock companies than the establishment of the Tea Clearing House, and the various Produce Committees formed to afford increased facilities for dealing with goods imported into London. Personally, I do not believe that the trade of the port has been much affected by the inability of a few large vessels to come up the river. This might operate in time, but the trade is so much more influenced by banking and financial facilities, and markets, that in my opinion these far outweigh other considerations. I am strongly of opinion that the management of the river should be put under one representative Board. As at present constituted, the Trinity House, the Thames Conservancy, and the Watermen's Company are the authorities. The maintenance of compulsory pilotage in the River Thames constitutes a grievance which has for many years been keenly felt. If a vessel navigating the river under a compulsory pilot does damage to a barge, the shipowner is exempt from liability, provided the officers and crew can show that they gave the pilot the assistance he was entitled to, and the pilot is not responsible for damage resulting from his negligence or want of skill, beyond his pilotage fee, and the bond of £100 into which he enters with the Trinity House. If, therefore, by the negligence of the pilot of a ship, a barge containing goods to the value of some thousands of pounds is run down, there is practically no redress, but if a barge does damage to a ship when under pilotage the shipowner can sue the owner of the barge for the full amount of the damage, and can in most cases recover his loss. In view of the constantly increasing steamship traffic on the 25 or 26 miles between Gravesend and London Bridge, over which lighters are continually being navigated, and upon which these conditions obtain, I submit that in the general interest of the port, as well as the interest of the lighterage

2519. But do they pay for the quay when the goods are going into barges in that way?—I have no doubt they do. The goods are either discharged by the ship, as in the case of the P. and O. steamers, for instance; 29 Nov. 1900. they use the wharf—  
*Mr. W. M. Smith.*

2520. That is their own wharf?—Yes, that is their own wharf. Then if the dock company is working the ship, they would simply land the goods and deliver them to the craft at the rate that was paid by the ship. They do it for the ship.

2521. You cannot tell whether the ship pays for it?—The dock is discharging the ship; they certainly pay for it.

2522. Do they pay for the use of the quay?—It is included in the delivery rate.

2523. I was under the impression that they did not?—They do to that extent, because that is part of the appliances by which they are enabled to do it, just as the cranes would be.

trade, compulsory pilotage should be so amended that this great injustice I have mentioned may be removed. The Watermen's Company is an anachronism, and a constant source of impediment to the trade of the port. In former days it may have had its uses, but now that crafts are mostly moved by tugs, it is not necessary that the men upon them should be able to navigate them with oars. The number of freemen has never been increased with the growth of the trade; and it is not reasonable that a body of, say, 7,000 men should be able by strikes to strangle the trade whenever they choose. I am Chairman of the British Oil and Cake Mills, Limited. If I send a barge to an import ship for linseed for the company's mills at Rotherhithe, I must employ freemen of the river, so many according to the tonnage of the barge, etc., but if I send a barge for the company's mills at Rochester to the same ship, I can employ whom I choose, and no one can assert that the voyage to Rochester does not involve more risk to the owners and crew than a voyage to Rotherhithe under steam. I am strongly of opinion that the rules and regulations of the Watermen's Company have for some years only been used as a means of legalised extortion, and I hope that, in view of the evidence that will be tendered to the Commission upon this subject, the Commission will see fit to recommend the abolition of the privileges of the company, and the throwing open of the river. I think it is very important that the Customs' officers in the warehouses should work increased hours. I believe they are not well paid, but 9 till 4, from the 1st November to the 1st March, is not a reasonable day's work. The effect of this is that under modern conditions of business, warehouse-keepers are unable to get their work done, so as to meet the requirements of the markets, within the limits of the legal hours. They are thus compelled to pay largely for overtime for the officers, in order to finish their work, with the result that the charges borne by the goods are correspondingly increased.

2529. Is there anything further that you wish to say?—No, I do not think so.

2530. We must refrain from asking you now any questions about the Bills of the Joint Committee to which you referred at the beginning, because we shall have to discuss those afterwards. Have you formed any idea of how the representative board that you refer to should be constituted?—What I think is that the water in the docks should be put under such a representative board, to be managed by representatives of the various trades, somewhat analogous to the Thames Conservancy, and that the warehouses should be left in the hands of the dock companies to carry on trade as other wharfingers do.

2531. Do you think it would be an easy matter to separate the dock business proper from that of the warehouse business?—Quite so, just the same as my own business is separated from the dock company.

2532. The suggestion has been made that the business of the wharves should be put under the central authority, and warehouses as well as dock business should be put under that?—It would be a large job.

2533. You do not agree with that?—Not at all.

2534. Not merely is it a large job, but it is an interference with private enterprise to a large extent?—Yes,

Mr.  
H. C. Smith.  
29 Nov. 1900.

I think so; and I think it would be almost impossible because its magnitude is so great; and really and truly a wharfinger's business is principally made successful or unsuccessful by looking into the minutest details. It is very difficult to carry on a large business of this sort at all; it must be done on a small scale more or less, and every item looked into most carefully. I think if it was done on a large scale it would be ruined.

2535. You have not formulated any plan by which the warehouse business of the docks could be separated from the other business?—The plan is the same as in my own business. I carry on a warehousing business; I go and fetch the goods from the docks. We have a very small dock of our own in which we can take some vessels.

2536. You do take some vessels, I believe?—Yes; I see no difficulty.

2537. Would you have any objection to that part of the river—the dock that you have—being put under the central authority?—It is hardly of sufficient importance, I think.

2538. Are there not some private docks which are important? They take sea-going vessels to a large extent, do they not?—Yes, they do.

2539. Would they be put under the central authority?—I do not see any necessity for interfering with the ships that come up the river and lie at the various wharves. They pay no charges for the use of the water. Their presence or their absence does not affect the question of the dock companies not being remunerative.

2540. I merely wished to ascertain what are the limits of your ideas on the subject—what you propose?—There are a great many ships which cannot come up the water towards London Bridge, and a great many will not come up the river; they will not lie aground. There are few wharves—there are only two or three—where ships of any great draught of water can lie afloat at low water.

2541. (Sir John Wolfe-Barry.) Of course it depends upon what is meant by sea-going ships, does it not? But you say that there are very few wharves that can take sea-going ships?—I say there are very few wharves where sea-going ships can lie afloat at low water.

2542. At dead low water, you mean?—Yes. For instance, in my own place I do have a good many ships, but they all lie aground.

2543. Do the Aberdeen boats ground?—I cannot say about them.

2544. Do you know whether the Dundee boats ground?—I do not know. I am not quite sure whether the Aberdeen boats and the Dundee boats do not load in the stream and finish off at high water alongside.

2545. As a matter of fact, I think they have a jetty, and they load at the jetty, and the jetty is part of the wharf; or some of them do?—Yes.

2546. I suppose the law of pilotage that you commented upon is one which affects every river, is it not?—I do not know.

2547. Is not the Thames a very peculiar river, from the immense quantity of barge traffic?—Yes.

2548. There are very few rivers that are at all comparable to the Thames in regard to the immense quantity of barge traffic?—I should think none.

2549. You said that wharfingers are compelled to pay largely for overtime for the Customs. Could you give us any figures as to what you and other people have paid during the year?—I have not brought the figures with me; I could get them out directly. It does come to a considerable sum, and it is paid in a very peculiar way. You pay so much for the officer that you have in attendance, and then you pay so much for other superior officers. That increases to a very large rate if you employ them two or three hours. You pay so much for the man who comes, and you pay so much for somebody else to look after him, and you pay so much for somebody else who looks after the other man. These other two gentlemen do not turn

up at all, and then you pay them for cab hire and all sorts of things, and it comes to a good deal. I could not tell you the details, but I could tell you what we pay per year.

2550. We should like to know what you, as a wharfinger, have paid?—If you will allow me I will send it to you. Do you want it for the last five years, or when?

2551. For the last five years, if you could. Perhaps one year would be exceptional; five years would give us a fair average?—I will have it made out.

(The Witness subsequently supplied tables as to the overtime paid to officers of Her Majesty's Customs by the proprietors of Hay's Wharf during the five years ending Nov. 30, 1900. See Appendix, 7th Day, No. 3.)

2552. Could you give us it in proportion to the volume of trade? It would not give us very much information if it was not in some proportion to the business done?—Do you wish us to send you our entries of all goods, do you mean, for five years?

2553. I did not mean that precisely. We wanted to know, rather, how much was paid for overtime to the Customs in proportion to the amount of business done at some particular wharf—or if you can spread it over a large number of wharves and give us the aggregate of both—to show what relation it bears to the value of the goods, so that we may at any rate know what we are talking about—whether it is 1 per cent., 2 per cent., or more?—Quite so; I will endeavour to do so.

2554. You recognise what we want?—Yes.

2555. But you say that it is a large amount?—It is a considerable amount; and it operates in another way. All the men are paid by the hour, and if you do not pay these Customs House officers overtime they would earn very poor money in the day. It operates in that way. It is a very undesirable thing, I think.

2556. Do you think it affects at all the time taken in discharging a ship?—I am not quite sure about that. I think that the hours for the people on board ship are longer. It is the people in the bonded warehouse who weigh goods, and the people who have to look the place up.

2557. What you call the inside staff. That, perhaps, would not affect the question of the time taken to discharge cargo?—You see the difficulty of your question. You have the locker who has to put the Customs House lock on the bonded warehouse. He has to stop two or three hours a day. You pay him so much an hour for stopping, but that bears no relation to whether you have 50,000 packages of tea or 200 packages of tea in the place; it is all the same.

2558. Then the amount of overtime you talked about does not refer to the amount of goods coming out of the lighters?—It does to a certain extent, because where they are bonded goods the place has to be kept open. It is extremely difficult to explain, but you pay so much for the first hour and a great deal more for the second hour, and a great deal more for the third hour, because other superior officers come in for their share.

2559. (Rear-Admiral Hext.) You advocate the abolition of the Watermen's Company?—Yes.

2560. And throwing open the river?—Yes.

2561. Lighters would have to be under some body for licensing, I presume?—Are you talking of licensing of the lighter or of the licensing of the men?

2562. You are quite right; I see your point. I was confusing the two?—But I do not see that there is any necessity for licenses.

2563. Lighters, of course, are surveyed at present in the ordinary way, I presume?—When a lighter is first launched she is measured, and the Watermen's Company decide as to the number of men. It comes within a certain tonnage, but beyond that there is no licensing of the craft at all; any craft could do the work. All we want is, that as we have to run the risk we should be allowed to employ anybody we like; now we cannot.

See 10509.

Recalled 10408.

(Adjourned to Tuesday next, December 4th, at 12 o'clock.)

# ROYAL COMMISSION ON THE PORT OF LONDON.

## EIGHTH DAY.

*Tuesday, 4th December 1900.*

PRESENT :

The Right Hon. LORD REVELSTOKE (in the Chair.)

Sir ROBERT GIFFEN, K.C.B., LL.D.

Sir JOHN WOLFE WOLFE-BARRY, K.C.B., LL.D., F.R.S.

Rear-Admiral Sir JOHN HEXT, K.C.I.E.

JOHN EDWARD ELLIS, Esq., M.P.

CECIL OWEN, Esq., *Secretary.*

Captain HENRY VAUGHAN HART-DAVIS, called, and examined.

2564. (*Lord Revelstoke.*) You are a partner in the firm of Hoare, Wilson and Co., wharfingers?—That is so.

2565. And you have been a partner in that firm for the past 16 years?—That is so.

2566. Will you proceed with your evidence?—Our wharves are situated on the south side of the river, a short distance below London Bridge. They are bonded for all goods with the exception of tobacco. The produce landed and worked there consists mainly of coffee, cocoa, spices, Singapore produce, tallow, tin, copper, and Colonial produce generally. From 30,000 to 40,000 tons are landed annually. The wharves are fitted with hydraulic machinery. The floor area of Willson's Wharf is, waterside, 57,000 superficial feet, landside, 102,000 superficial feet, and of Symon's Wharf, waterside, 18,000 superficial feet, landside, 152,000 superficial feet. The respective frontages to the river are 120ft. and 118ft. Owing to the comparatively small frontage a ship-alongside business is not cultivated, although there is sufficient water, that is to say, 16 to 18ft.; the produce, therefore, is brought up mainly by lighters. I am of opinion that the toll which the London and India Docks Joint Committee proposed by their recent Bill in Parliament to levy, would operate very prejudicially on the trade of the Port of London. London rates and charges have already been made the subject of complaint, and it would not be possible, under present conditions, to reduce them, whilst this toll, if enforced, would increase them very considerably. Thus with coffee, under the operation of this toll, my wharf charges would be increased 8½ per cent., with sugar about 25 per cent., and with tin or copper over 50 per cent. Perhaps I may state here that I have taken these figures out on the consolidated rates. I have taken them at 1s. 6d. per ton, and I am perfectly aware that the dock companies state that that is the maximum charge that they propose to make. They are taking powers for that as a maximum amount, but I submit that we have to protect ourselves against that maximum.

2567. We do not wish to go into the dock companies' case?—I was only trying to explain my figures. Many millions of money have been sunk by private enterprise alongside the waterside, on the faith of free water and Parliamentary consistency, and this expenditure would

be absolutely imperilled. May I state my views with reference to a tax on goods in that aspect? *Capt. H. V. Hart-Davis.*

2568. I think there is no objection to that?—My idea is this: that the water in the docks has been dedicated for ever to the public, according to Lord Cardwell's statement. *4 Dec. 1900.*

2569. (*Mr. Ellis.*) That was a speech in the House of Commons?—Yes. I think that is public property, is it not?

2570. Certainly, but it was not a statement *ex officio*. It was merely a statement made in the House of Commons?—Yes, it was merely a statement made in the House of Commons, as a member. It appears to me that it would be equally equitable to charge goods in wagons and in carts as on the water; and if a new authority were constituted to take charge of the dock waters, and their business possibly, and that new body conceived that it was necessary in the interests of trade to put a toll upon barges, I submit that that could not be equitably met by a charge on goods. If the public who have received this freedom of water choose to give up that freedom, which of course they can do through Parliament, I submit that charge ought not to be put upon one industry. It ought to be made a tax upon the whole of the rateable value of London, raised, if necessary, by precept.

2571. (*Lord Revelstoke.*) Do you suggest that the water of the dock should be separated from the warehouses?—Later on I do.

2572. But that is what you are talking of just now?—Yes. The Port of London, in my opinion, is suffering from many adverse conditions. The docks are situated too far from the centre of commerce. The appliances for loading and unloading on to quay and into lighters are not altogether up to date. The river requires deeper dredging. The warehouse accommodation for goods, though ample, is too much scattered. Further facilities for road and railway transport are necessary. The delays now experienced in London are unreasonable. Thus, to compare Southampton with London (and of my total landings in 1899 one-fifth came from Southampton and four-fifths from the docks). I will give you a few examples, taken at random from my ship entry book:—

*Capt. H. V.  
Hart-Davis.*

4 Dec. 1900.

Name of Ship.	Port.	Date of Entry.	Date of Completion.	Number of Packages.	Days.
"Don" - - - -	Southampton - -	12th October - 1900	22nd October - 1900	2,300	10
"Orinoco" - - - -	" - - - -	30th August - "	7th September - "	2,300	8
"Para" - - - -	" - - - -	18th July - - "	27th July - - "	1,500	9
"Trent" - - - -	" - - - -	16th August - - "	24th Aug. - - "	750	8

"Anrenor" - - - -	" "A" - -	14th August - - "	23rd October - - "	800	9

I only wish to point out what my experience has been against the docks in London as compared with Southampton. I get very much better despatch from Southampton than I do from London, and I have tried to compare like with like.

2573. (*Sir John Wolfe-Barry.*) Speaking with regard to the Table, what does "Date of completion" mean?—Arrival at my wharf. Of course, from Southampton goods have to be brought up by rail to Nine Elms in locked vans, and then they have to be lightered down to my wharf.

2574. (*Sir Robert Giffen.*) How long does that take?—That varies a good deal. The only way I can check it is by the first date of entry and the final completion. The result to me is that despite that disadvantage, I get the goods with greater despatch, and also it would appear to me from the point of view of the importer that Southampton is two days short of London in the length of the voyage of the ship. Then, continuing my evidence, the present position of the lightermen is anomalous and out of date. Formerly they were required to navigate their barges in a narrower and shallower river; now the barges are mainly brought up the river under tugs. Their monopoly should be abolished, and the freedom of the river assured, subject to registration by a central authority. There are other trade customs that in my opinion operate adversely to London, as compared with other ports, namely, our antiquated methods of weighing and taring goods. I am quite aware that these customs are not the subject of legislative enactment, but in my opinion they do operate very prejudicially to London. Bags, say of coffee, in London are weighed singly, and the turn of the scale is, therefore, entirely against the importer; on the Continent and in Liverpool such bags are weighed in drafts of 5 or 10 as the case may be. Similarly, in taring, the bags are weighed separately, and a fraction over a pound is taken as a pound. Thus a bag weighing 3lbs. is tared as 3lbs., but one weighing, say, 3lbs. 3oz. is tared as 4lbs., involving a loss to the importer of 13oz. of coffee on every such bag. The trade custom of "draft allowance," I am informed, is prejudicial to London. May I state here that I have submitted this point to a very well known produce broker in London, a man of the very largest experience. It is not for me to suggest, but I do hope that some members of the London Produce Brokers' Association will give evidence before this Commission, and with your permission I would read a letter from a gentleman—I do not know that I am entitled to give his name, but I would hand the letter to you, my Lord—on that point of weighing, which is rather important.

2575. (*Lord Revelstoke.*) Do you wish to put the letter in?—Yes.

2576. Then I think we must have the whole letter?—Must I give the name?

2577. Yes, we must have the whole letter or nothing?—I do not know that I have his authority. I hope that he will be here to give his evidence.

2578. Then, perhaps, we shall have the pleasure of hearing him later?—In case he is not called, I think I will take upon myself to put the letter in.

2579. Very well?—Dear Captain Hart-Davis: 'I quite agree this as regards weights. The loss here to importers is also the ounces on gross; thus: 1cwt. 3qrs. 12lbs. 12ozs. is called 1cwt. 3qrs. 12lbs., so they often lose one-half to three-quarters of a pound a package in gross and in tare. I think all weights gross and tare should be taken to half-pounds.' There I entirely agree with him. "Under 8ozs. to lower weight, over to higher weight, and returned to the half pound. These little variations often mean one-half per cent." Then he goes on later in the letter with reference to a statement that I make later in my evidence. Shall I read that as well?

2580. If you please?—"I see no real and final remedy till the whole landing, housing, working, etc., is in the hands of a public authority, one ready to take the ways of our foreign rivals and all nations into account, who will send men to learn what goes on elsewhere, and place London on equal terms. Yours very truly, S. Figgis." Mr. Figgis is a gentleman of the very largest and widest experience in the City of London, and his firm is one of the very highest standing among produce brokers. I am fully in accord with my colleagues, interested in the wharfing business, in their opinion that the control of the waterways and quays at the London docks should be taken in hand by a trust as suggested; such a trust would be of the greatest value to London. All profits made, after meeting interest charges and obligations, should be put into the river in the shape of improved accommodation and better appliances, and the river should be deepened. These improvements a trust, able to raise money at a low rate of interest, and having no shareholders to consider, could indubitably effect, but I cannot refrain from recording my own individual opinion that a much wider and bolder scheme involving a trust to embrace all waterside interests could, by effecting enormous economies, offer such inducements to merchants and shippers in the shape of the most up-to-date appliances and methods, and low charges and rates, as would lead them to prefer London to any other port, and not only arrest the present decadence of London as a port, but inaugurate a new era of prosperity. I had rather anticipated a request that was made by the Chairman at the last meeting of your Commission to Mr. Marten Smith, with reference to the capital embarked in the wharfing business, and I had endeavoured to get out some statistics with reference to that. I have made an estimate of the value and income of the docks and wharfs, which I will hand in.

(*The Witness handed in a table showing the estimated value and income of the London docks and wharves. See Appendix, 8th Day, No. 1.*)

I have endeavoured in these figures to arrive at what I consider to be, as nearly as possible, the valuation of the dock assets and their present values, as checked by a leading broker in London, to see what the money involved in a scheme such as I would suggest amounts to.

2581. (*Sir John Wolfe-Barry.*) These figures about the dock company are taken from their printed returns, I suppose?—Yes, and the Stock Exchange.

See 2469-77 and 2649-50.

2582. The amount of capital is taken from their printed returns?—Yes.

2583. (*Sir Robert Giffen.*) Have you considered whether they agree with the information which has been given by the dock companies to this Commission?—I have not gone into that.

2584. The dock companies have stated their capital to this Commission, and I observe that their figures do not agree with yours?—Perhaps that could be checked over by the secretary. I got them from the best information obtainable at the time.

2585. (*Lord Revelstoke.*) I think you only put forward these figures with a view of suggesting what in your mind is a proper figure for any future capitalisation of the Trust?—I wanted to show that my view of a wider and bolder trust was within the bounds of possibility.

2586. (*Sir Robert Giffen.*) For instance, you give the total capital of the dock companies, including the Surrey Commercial Dock and Millwall Dock, as £17,720,530 approximate value?—The approximate value on the 20th November.

2587. The Joint Committee claim that their value is from £18,000,000 to £19,000,000?—That, I think, is the nominal value.

2588. The actual value?—On the market?

2589. To a large extent the real value which they would claim. I am not disputing the question of the market value?—I was merely taking the market value from one of the leading brokers on the market—the Stock Exchange. I do not wish to press the point at all if I am not in order.

2590. (*Lord Revelstoke.*) We are only dealing with questions of fact?—I only wanted to suggest that the thing was possible.

2591. (*Mr. Ellis.*) You are a wharfinger, and I see you give some figures with reference to wharves. I think those figures would be valuable?—With reference to the capital involved in the wharves, we have had official and confidential returns from 99 wharves, showing £7,830,758. From the balance of the wharves with whom we corresponded—221—we got no returns. Some of them were naturally reluctant to send in returns of the capital involved, and they did not thoroughly understand the position, so I have been obliged there, in estimating, to take the gross rateable values of those wharves, and put them at an arbitrary figure of purchase—say twenty-five years. That, of course, is purely arbitrary, and must be so, but that would make a gross rateable value, leaving out working capital, of £5,310,475, or a total minimum working capital in the wharves of £13,141,233. Assuming these values to be approximately correct, the total value of docks and wharves would be £30,861,763, and the annual interest required on a 3 per cent. basis would be £925,853. Then, with reference to the income earned, I had to take an arbitrary sum as the amount that the wharf would probably earn, and I take it as an assumption that no private undertaking could be carried on at a less interest per annum than 5 per cent. If a man could not earn 5 per cent. on money he put in a wharf, he would probably go out of the business, because he could earn more than that, probably, outside. Taking 5 per cent. as the minimum interest earned by the wharves, the combined earnings would equal £667,061; then, adding to that the average assumed income of the docks as above £688,824, it gives a total of £1,345,885. No doubt, the docks and wharves may not necessarily be acquired at their absolute ground values. If they were acquired, they would have to be acquired more or less compulsorily, and therefore a certain sum would have to be added on that account. But in these figures I wish to show that, as far as I have been able to gauge them, they show a workable margin.

2592. (*Lord Revelstoke.*) Is there any instance in which the yearly accounts of any wharf are published?—There may be one or two in the case of limited liability companies, but not to my knowledge.

2593. Therefore, you are not prepared to put in any statement as to the profits made by any wharfingers?—No; I could not. You must act on an assumption there. May I just suggest what my idea of the trust should be, if such a trust were formed?

2594. Yes?—I suggest a Port of London Trust—(a) To control the waterways, quays, docks, and public warehouses of the Port of London. (b) Representatives on the Council from the Corporation of London,

the Thames Conservancy, from the docks, from shipowners, from wharfingers, from merchants, from brokers. (c) To purchase the whole of the docks and public wharf interest in the port, under a guarantee from the Corporation of London, together with, as security, the freehold of the various buildings and undertakings. (d) The loan to be raised at par, on a 3 per cent. basis, and after paying interest, cost of management, etc., all profits made to be employed in improving the navigable channel and dock and warehouse accommodation, and in reducing, where desirable, the rates on shipping and on produce. (e) The warehouse accommodation to be grouped and centralised for the various trades, unsuitable docks and warehouses to be demolished, and the sites realised for the benefit of the trust, etc., etc. (f) Power to levy rates on shipping and on goods. I have considered the matter rather deeply, and I have come to the conclusion that, if London is to have a cheap port, if she is to compete with foreign countries under her grave disabilities at present, that scheme would be the only solution. Anything short of that, such as a trust for the waterways and quays, would be grasping at the shadow rather than the substance. May I elaborate one little point with reference to the disabilities of the Docks? I have said that they are not up to date with regard to appliances. My contention is that in the River Thames, owing to its sinuosity and great length, the big ships must lie at a very considerable distance from the centre of commerce, and therefore we must accept the position that the bulk of London trade will have to be carried by lighters. Now what provision has been made in the docks for a lighter trade? The construction of the docks has been to my thinking excellent so long as they are self-contained, and so long as all the produce that comes into them is landed and warehoused at the dock; but if the goods have to go away from the dock to other warehouses I maintain that the accommodation is very insufficient. For instance, I will take a ship that goes, say, into the Albert Dock; she has a berth there and all the cargo, if it is a mixed cargo, is put upon the quay. My lighters are down there waiting for an opportunity, as soon as the ship clears out, to get alongside and take the goods away. I secure a good berth; the moment that berth is secured, perhaps, and probably, a dock authority comes up and says: "You must clear out of this," because another ship is coming into the same berth. The other ship comes into the same berth, and my lighters have to clear out. Then a fresh consignment of goods out of the new ship is begun to be landed; there is a great deal of confusion, and a great deal of money lost, and a great deal of time lost, and eventually the goods have to be trucked a very considerable distance along the quay, at the cost of the dock company, to my lighters. On some occasions I have had to wait two or three days before I could get my goods that were lying on the quay. It has always appeared to me that what you require for a trade such as London trade is, is a side canal about 40ft. wide and, say, 8 to 9ft. deep on the other side of the shed or quay.

2595. (*Lord Revelstoke.*) I think I am right in saying that it has already been pointed out to us that a considerable amount of warehousing is done in the sheds of the Albert Docks?—Undoubtedly, but I propose under my scheme that there should be a central shed; that the ships should come into the basin here; that on the other side of that shed there should be a shallow side canal with a separate entrance; and that there should be an overhead gantry or line of rails running down the shed with travelling engines—electrical engines preferably—I have them in one manufacturing business in which I am concerned—with a jib which would project over the hatchway, and take the goods out of the ship. They would then be brought into the shed. Goods going to lie at the docks or for transhipment from the docks or to lie at a quay rate, should be deposited in the sheds, and the remainder be passed over direct with one lift, or one handling, into the barges. I think by some such system as that you would get an enormous advantage in the way of expedition, and you would reduce the difficulty of locking the barges in and out of the main basin to a very considerable extent.

2596. You are, I suppose, in active competition with the dock companies?—Yes, undoubtedly.

2597. And with the other wharfingers?—Yes, undoubtedly.

2598. Are you in agreement with the dock companies as to the rates charged?—Yes, we had to do so to save the situation, because of the absurd competition that was going on at one time.

*Capt. H. V. Hart-Davis.*  
4 Dec. 1900.

*Capt. H. V. Hart-Davis.* 2599. When you say "we" you mean your individual firm, I suppose?—And other wharfingers with whom I am associated.

4 Dec. 1900. 2600. Not all the other wharfingers?—Not all, but the bulk.

2601. But I suppose, with regard to the wharfingers who are not in agreement, their rates practically govern the charges which are made?—Well, I hardly think it would be fair to say that, because I think the bulk of the leading wharfingers are in agreement with the docks, and trade is a very curious thing. Certain docks have a reputation with regard to the treatment of certain articles, and I think they could very probably hold the goods at a higher rate than the outside wharfinger who is not in agreement could if he had not the same reputation.

2602. But the dock companies' rates form the basis on which the wharfingers' charges are made?—Undoubtedly.

2603. And, in your opinion, those rates are equitable?—They are as low as we can make them under present conditions. Our object has been in this agreement not to put up rates unduly. We have tried to meet the trade in every conceivable manner. It would be ridiculous to put on prohibitory charges, because that would kill the trade altogether. So the result of our agreement has frequently been the lowering of rates.

2604. Then with reference to the suggestion you made for a Trust, I presume it is intended that the water should be separated from the quays?—Not in the case of my big Trust. I propose that the whole thing should be under one authority.

2605. Otherwise, I mean, the quays would be under the control of the dock companies; you do not intend that?—I propose that the whole thing should be taken over body and soul. To my mind there is some difficulty in taking the quays and the waterways alone. In the London and St. Katharine Docks the warehouses abut right on to the water. I have no doubt it might be got over, but it would be a difficulty.

2606. Do you not think it would be difficult to have the management of the warehouses and shipping business separately arranged?—I should not imagine so; I do not think so; I do not see why there should be a difficulty, but, according to my scheme, it would all be managed under one authority.

2607. Then you mentioned: "all waterside interests." Have you taken into consideration how many interests there are? For instance, there are the tributaries of the river which form practically part of the Port of London?—Well, I meant all existing waterside interests.

2608. They are existing, are they not?—Do you mean water tributaries?

2609. I mean the navigable tributaries; they are all part of the Port of London, are they not?—I have not taken those into consideration.

2610. You have never considered whether there would be difficulty in getting all these interests to agree?—I have no doubt it would be a big question and a difficult one. I may say, with regard to my suggestion, that I daresay a large number of the wharfingers might disagree with my evidence *in toto* with regard to a big scheme, but at the same time I may say there are several others who have thought the matter over, and who believe that it is the solution, and the only one.

2611. (*Sir Robert Giffen.*) Have you considered how far your scheme would affect manufacturers and those who have waterside premises to which a wharf is attached?—I presume that they would be outside the scope of the Trust, but that the Trust could arrange with them as to their business.

2612. Still that is your solution of the problem as far as that is concerned?—That is my solution.

2613. And that would leave a considerable part of the river not really included in the Trust, because it would belong to private parties?—Yes.

2614. Then coming to your figures, I suppose we may infer from them that in your opinion the business of the wharfinger is much more profitable in relation to the capital invested than the business of the dock companies, because you assume as the profit of the wharfingers at the present time £657,000 upon a capital of £13,000,000, and on the other side for the dock companies you have £608,000 upon a capital of the approximate value of £18,000,000 sterling, but where I believe something like £23,000,000 has actually been invested?—When I estimate the total value of the wharves at £13,141,000 I am under the mark,

and largely under the mark, because I have merely taken 25 years' purchase of the present rateable value. I have got no floating capital.

2615. Still I am correct in taking it that you show that relation between the profit of the dock companies and the profit of the wharfingers?—There is no capital allowed for as invested in the business to begin with—there is no floating capital—and, in addition to that, I think you may take it as a rule that a private wharf working a smaller business and giving it the whole of their individual attention would probably be able to secure, by looking after *minutiae*, better profit than another wharf owned by a public company.

2616. Or a Trust?—A Trust would be rather retarded by the fact of its being a public company, of course.

2617. It would not be able to make such a good profit as the wharfingers now make?—Not such a close profit, probably; but by grouping the wharves and saving the cost of management—because each wharf has to keep up a very costly staff to do all kinds of work which it would not be called upon to do during the bulk of the year perhaps—by grouping all that I submit that you would make a very large saving.

2618. Would it be fair to say that the wharfingers make this profit of £657,000 out of the warehousing business rather than out of the dock business?—Undoubtedly, because the bulk of the work done by wharfingers is the warehousing business. There are very few that have docks.

2619. And you have not considered the question of how much of the profit of the dock companies is made out of the warehousing business and how much out of the dock business?—I have not separated them here.

2620. Have you come to any conclusion on the subject?—I have naturally watched it with some interest, but I cannot say that I have gone very closely into the figures.

2621. Then coming to some other points of your scheme, you refer to the practice now of the barges or lighters being towed up the river by tugs. Is there any change in the last 20 years as to the use of steam barges on the river?—We do not use them at all. Our lighterage work is done by a very large lighterage company who own a very large number of tugs with a fleet of first-class barges, but there are no steam barges amongst them.

2622. Is there any difficulty about the use of steam barges that makes them unsuitable for the business?—Well, I have not gone closely into the question, but I should fancy that they might not be suitable for very valuable cargoes. I do not know how the question of insurance would be affected.

2623. The question has never arisen about the use of steam barges instead of the use of tugs with lighters?—No; but may I be allowed to state with reference to goods coming up in lighters, I have gone into this last year, 1900, and I find that not one single barge has come up to my wharf from the lower docks—I will not say from the river or possibly from St. Katharine's, but certainly not from the lower docks, except under tug, and not one single barge has gone back empty except under tug.

2624. So that you have the use of steam in that form, but not with the lighterage itself?—Yes; but the lighterman, I submit, does not earn his money, because the work is done for him by the tug.

2625. (*Rear-Admiral Hext.*) In your proposal to form a Trust taking in the dock companies and the wharves, would you also enclose the foreshore of the river?—I should undoubtedly, if possible.

2626. That would affect the estimate that you have already given us?—It would in that case, but it would add a very valuable asset.

2627. As regards lighters, do you not consider that the loading in the docks has great advantages over loading or unloading in the stream?—It has great advantages as regards safety; it has not advantages as regards despatch. I have taken goods out of ships lying in the stream lower down without any loss and with great despatch; but, of course, in the quiet waters of the docks there is an advantage. In the same way that a cart going along any street in London has advantages from its being well paved and well looked after, for which it pays nothing.

2628. (*Mr. Ellis.*) You gave us an illustration as to the delays at London in comparison with the system at Southampton. I may take it that those are fair samples?

—I have tried to make them so. I have tried to compare like with like.

2629. What proportion do those bear to the total number of ships that you have in the year for instance?—The total number of ships in the year would be between 800 and 900.

2630. In any one year?—In any one year. We have had entries for about 900 ships. I took some later date ones—I did not want to multiply the number.

2631. Has the variation to the disadvantage of London been increasing of late years?—No, I have not noticed that. Of course, where ships are loaded from a jetty you get better despatch. I have not noticed any falling-off; I think it has always been so in my experience.

2632. It is about stationary?—It is about stationary.

2633. The delay is not increasing to the disadvantage of London?—I do not think so.

2634. Then you allude to weighing and trade customs. Is any interference with those trade customs a part of your policy?—I should like to see those trade customs varied undoubtedly, because I think it is a loss to the public as they exist.

2635. I am rather wanting to get at what is in your mind as to how you would interfere. In what way would you propose to interfere with those trade customs?—Only by bringing it permanently forward that it is a loss, and I think the weight of a recommendation from the Commission would be very very great.

2636. That is what I was going to ask you. Do you suggest to us that the Royal Commission should embody in its report some recommendation as to legislation with regard to that?—I do, most undoubtedly. Our weights in London are constantly unfavourably compared with Antwerp, or Ghent, or Havre, and for this reason, that the bags there are weighed in drafts. If you have to give all these little amounts to the buyer —

2637. You will understand that I do not want you to argue it. I only wanted to know what was in your mind. You desire a change, and I want to get at what change you want. You really put it to us, as a Royal Commission, that it would be advantageous that there should be legislation?—Yes.

2638. It is a very important point, you will admit?—I quite admit that.

2639. Do you think the chances of getting a Bill through Parliament for the improvement of the Port and Docks of London would be increased by legislation with regard to trade customs. Have you considered that, as an experienced man?—There would be a move against it, undoubtedly, from some buyers who obtain advantages under the present system; but it seems to me to be so reasonable and so right that we should reform any antiquated methods that are causing us loss that I think a right-thinking community would agree with it absolutely.

2640. You think there would be a sufficient volume of instructed opinion among those who are interested to support any Government (it would be a Government, of course) in such a proposal?—I think so.

2641. I would ask you to rather deliberately weigh your words, because it is very important from the Parliamentary point of view?—I quite see the point.

2642. You think that those interested in the Port of London would support a proposal to compulsorily change those trade customs?—I think so.

2643. Then, turning to your figures of docks and wharves, of course the figures relating to the docks stand on rather a different plane, anybody can work those out; but turning to the wharves, I rather infer from you that this figure of £13,141,000 would have to be increased?—It would.

2644. You do not think that that is a fair figure, then?—No; I do not.

2645. Have you any figure in your mind that would be a fair figure, because it is no use our getting on our notes a figure from a witness who thinks it is not a sufficient figure?—It is so very difficult indeed to arrive at anything that is really sound. I can only give my opinion on that point.

2646. But your opinion is that it would have to be considerably increased?—I think so, because evidently there is no working capital; no wharf can be worked without a certain amount of floating capital.

2647. You are a man of great experience. Can I get any figure from you at all? Can you give us a figure that we can work at, or would you rather say that you are not prepared to commit yourself?—I am not prepared to commit myself, but I should not be at

all surprised if that amount would have to be increased to the extent of between £1,000,000 and £2,000,000.

2648. Then we are coming rather nearer. May we take it at about £15,000,000?—That would be my suggestion.

2649. As I understand, these figures are put forward by you in response to the suggestion of Sir Robert Giffen, who then occupied the chair, at Questions 2471-2477?—I had prepared these figures before that date. I only mentioned that incidentally, as Sir Robert Giffen asked Mr. Marten Smith. I think it would be desirable that the chairman of the Wharfingers' Association should have the figures worked out independently for himself, and they can be compared with mine. I have arrived at those from the best information at our disposal.

2650. You give us these after having done your best to get accurate information?—That is so.

2651. Then one further question. What you have termed your big scheme would be a matter, I apprehend, of some controversy. You speak as an individual, to put it plainly. You do not come before us in a representative capacity?—No; in no representative sense whatever.

2652. Purely as an individual?—Purely as an individual.

2653. But speaking from your own knowledge and experience?—Certainly.

2654. (Sir John Wolfe-Barry.) About the goods coming from Southampton, I see you say there is "a small saving of time." Is there a sufficient saving of time to warrant extra expense in bringing them from Southampton, or is the expense greater?—The expense is about the same under the arrangement that I have been able to make.

2655. From the ship's side into your warehouse?—Yes.

2656. About the same?—About the same.

2657. The cost of bringing goods, therefore, from, say, the Albert Dock into your warehouse, is about the same as bringing goods of the same description from Southampton also into your warehouse?—Yes.

2658. Expenses included?—Expenses included.

2659. With regard to the custom of weighing, is that a mere trade custom or is it a custom which is made under the regulation of her Majesty's Customs?—It is a pure-trade custom. Of course, her Majesty's Customs have something to say to it. At present they would not allow me to weigh goods to the half-pound.

2660. Or with regard to single sacks?—Nor with single-sacks. They would demand that the goods should be weighed singly in accordance with the trade custom.

2661. Then it is a combination now of trade custom and regulation?—Exactly.

2662. Then with regard to any change, if there is a change, of trade customs, do you think Her Majesty's Government would require also legislation in order to alter the plan, or would they follow the trade custom?—They would follow the trade custom, I take it, entirely.

2663. Then you think, I suppose, it is mainly a question of trade custom, and not a Government question?—Exactly, and it would result in an increase to the Customs in the duty paid on dutiable articles, because they would get duty on the amounts that are thrown away at present.

2664. I want rather to understand exactly what your proposal is about buying the wharves. Is your proposal that every wharf on the banks of the Thames should be bought by the Trust for a certain distance below London Bridge or only isolated wharves?—Every public wharf.

2665. What is the difference between a public wharf and the ordinary land facing the river? Do you mean a public wharf licensed by the Board of Customs, or in any way with a Government status, or do you mean ordinary wharves?—I should say all those having a Government status, of course, at first, but any public wharf that caters for the public—any public wharf that takes goods on certain rates, and does not arrange merely its own produce. There are private wharves owned by private individuals for their own private purposes. They would not do anybody else's work. They would not be competitors with the port.

2666. You will understand that my questions are not a matter of cross-examination. I am only trying to understand what your proposal is. Take the case of a wharf like the General Steam Navigation Company's wharf. Under your proposal, would that be purchased?—I should propose to purchase it.

Capt. H. V.  
Hart-Davis

4 Dec. 1900

*Capt. H. V.  
Hart-Davis.*

4 Dec. 1900.

2667. Then take the cases of the Dundee and Aberdeen Wharves, where their steamers lie and take in cargo. Would those be purchased?—Yes.

2668. Every wharf of a public nature would be purchased?—Yes, that is my scheme.

2669. What would happen with a vast quantity of very tumble-down property that one sees along the river? Would all that be purchased?—If it is tumble-down property you would probably acquire it at a very low figure, and the site could be turned to value.

2670. I only want to understand your proposition. Would you buy that?—Yes, undoubtedly, if it is a working wharf.

2671. Suppose it is not a working wharf. Is it the proposal that the Trust should buy all property facing the river?—No, not where they are private wharves, or in some cases there are breweries and oil mills. I should not propose to acquire those.

2672. Then take the case of property that is not occupied now by a wharf, but which could be very easily turned into a wharf; would you purchase that?—I should give the Trust power to acquire such property if they thought it desirable.

2673. Then is the object at last to be that the Trust should own all the waterside property for a given length below London Bridge, as far as it is possible to devote it to public purposes?—As far as it is useful to devote it to public purposes.

2674. But what might not be useful now might very probably be most useful five or six years hence?—If the Trust were constituted as I suggest, and it was able to effect these large economies, I do not think you would find any large competition from the few private warehouses being built outside it. I do not think they could live against it.

2675. That is what I wanted to have in my mind. Would it not be possible that the Trust should own a portion of the property, and that the rest of the property should come into competition with the Trust?—I should think you could practically make it impossible for them to compete with you in a Trust of that nature. A Trust could put on prohibitory rates upon goods going to these newly-erected warehouses.

2676. Do you mean that, supposing a man had a wharf, supposing he had built his own wharf on his own land, any public Trust could put a prohibitive rate in any way against his using his own land as a wharfing?—No, I hardly mean that.

2677. Therefore, it seems to me, subject to what your views are, that unless you buy all the property, the Trust will always be exposed to competition?—Well, it makes a larger order of it than I had expected.

2678. I only wanted to know how far you were going?—That is possible. It might be desirable, at any rate, that the Trust should have power to acquire all the waterside property.

2679. Could you give us the least idea as to the length along which this power should be exercised below London Bridge?—I should say practically six miles down below London Bridge.

2680. Six miles below London Bridge?—I should think so, probably.

2681. Then would the idea be that some public body to be constituted by Parliament should have powers of compulsory purchase over the whole of the property for six miles below London Bridge on both sides of the river?—They would have power in the interests of the trade of London.

2682. Would they have compulsory powers of purchase?—Yes.

2683. And if they exercised those powers, I suppose they would have to exercise them under the ordinary conditions of the Lands Clauses Consolidation Acts?—Yes.

2684. And, according to ordinary custom, they would have to exercise those powers as against an unwilling owner, and would have to give him the value of not only all that he could prove, but something for compulsory sale?—Something for compulsory sale.

2685. That is usually in London taken at about 10 per cent.?—As with railways.

2686. The Trust then would have to buy all the land at the valuation of the land, and of all interests, such as occupiers and traders under the Lands Clauses Acts, under the usual conditions of compulsory purchase?—Yes.

2687. Those figures, I suppose, if it were turned into money, would represent a very much larger sum than anything we have been talking about this morning?—It would represent a pretty considerable addition.

2688. Have you ever thought at all what the money involved would be in order to buy six miles of riverside property on both sides of the river?—No, I have not.

2689. It would be a very large sum?—Yes, but it is hardly conceivable that the Trust would exercise its compulsory powers excepting in localities where it was advisable to do so. It would not abruptly take and buy up the whole thing.

2690. I presume the Trust would have to elect within some given number of years whether they would buy the property or not?—Undoubtedly; they would have some experience by that time.

2691. If they did not buy the property, they would be exposed to competition?—Undoubtedly; they would have to weigh that.

2692. Now, I am going to ask one other question about what you say with reference to accommodation for goods which are unloading at a dock and going into barges and going to a warehouse. At present they are put on the quays to a great extent, are they not, and are there stored?—They are.

2693. And partly they go to the docks and partly they are taken into lighters?—Yes.

2694. Is anything paid for the use of the wharf for that purpose?—For the use of the dock quays?

2695. Yes?—No; they are landed on the dock companies' quays for the convenience of the dock companies. I should prefer their being put straight into my lighter.

2696. Would it not take a very much longer time to load into lighters if the goods were not put upon the quays?—Not if my system were adopted, of having a side channel.

2697. But I mean under the present conditions. Does not overside unloading take longer?—It depends what berth you get; it depends where your goods happen to be stored in the ship's hold. If you have got a good berth, and your goods happen to be at the top, you get very speedy despatch.

2698. Does it not depend on the facilities for sorting. If you can sort on the quays before putting into the lighters, do you not save a good deal of time?—Undoubtedly.

2699. Subject, of course, to what you say about the difficulty of taking the goods away again?—Yes.

2700. But for convenience of trade, a large quantity is put on the quays, and sorted, and then put into lighters?—Yes.

2701. And for that facility nothing is paid?—Nothing is paid.

2702. Would it be your proposal that your canal and all these other facilities for the convenience of the trade of the warehousemen should also be provided free of cost?—I think it would be equitable, because I think the saving to the authority would be so very great in time and in labour. The great difficulty of a wharfing's business is the question of labour. That is a question that has to be watched very closely. You may easily turn a profit into a loss by being careless about your labour.

2703. Therefore, your position is that the wharfing is entitled, not only to free water, but to a free wharf as far as it is wanted, and to canals and other conveniences for the prosecution of his trade, without any payment?—I would like to modify that to this extent. I say that if the Trust or the newly-constituted body found it necessary to levy any charge or toll on barges, that ought to be met by the public.

2704. Not by the wharfing?—By the public. The wharfing's surrender a freedom that has been dedicated to them, and the public take it against the wish of the wharfing. Why should they make the wharfing bear the whole of the cost of it? That is my contention.

2705. Do you draw any distinction at all between free water and free quays and free canals?—I would draw a distinction as to free canals. If that was created, it might be a fair charge on lighters, provided it is spread over the whole community.

2706. But if it was charged on the lighters, it would not be spread over the whole community, would it?—It would be leviable by a tax.

2707. By rates?—By rates.

2708. Of which the lightermen would pay their proportion as ratepayers?—As ratepayers; just the same as a carman going along a road pays his proportion of maintaining the road.

2709. That is exactly what I wanted to find out. You suggest that some payment should be made for these facilities, but that it should be a payment spread over the whole community?—For the benefit of the Port of London.

2710. (*Lord Revelstoke.*) Then do you suggest that the London ratepayers should be responsible for the final payment of interest on the securities of the Trust?—I suggested that the Corporation of the City of London should undertake the guarantee.

2711. You called it a Corporation Trust, I think?—Yes.

2712. Of course the first moneys would come in from the charges they levied; but in the event of those charges being insufficient, do you propose that the London ratepayers should be responsible for the payment of interest?—As behind the Corporation, undoubtedly.

2713. You know it would run into very large figures. The operation would be so large that you would want excellent security?—No doubt.

2714. And you suggest that the London ratepayers should form that security?—Together with the freeholds of the various properties; that of course would only be collateral; but I do not expect that the Trust would find any difficulty.

2715. But whether the Trust found any difficulty or not, you would make the London ratepayer responsible for the payment of that interest?—I think he would get his *quid pro quo*.

2716. But he would make himself responsible, whether he got his *quid pro quo* or not?—Yes.

2717. (*Sir Robert Giffen.*) Have you in your mind that this Trust should acquire and occupy up-town warehouses such as the dock companies have now?—The great idea in my mind has been the grouping of warehouses for certain trades. Trades are very little kattle in that way; they will only go to one place. If the up-town warehouses that the docks now possess are the very best places

in the trade, I should retain them. If not I should sell them as they are on very costly sites, and try to see whether a site nearer to the river which would be less costly to bring the goods up to, could not be acquired, which the trade would accept.

2718. Then the Trust would have power to acquire warehouses not on the riverside?—If desirable. They would have the power, I take it, if they thought it desirable to buy out the whole interest of the docks.

2719. Then it would also be possible for a warehouse not at the riverside to be in communication with Southampton or Bristol or Liverpool or Hull, and to do a warehouse business there just as you do now yourself with goods coming from Southampton?—They would have to come by road, and their having to come by road would cripple them.

2720. But you have told us you get your goods as cheaply from Southampton as you do from the docks?—But I do not have to cart them.

2721. They go to the wharves of the railway somewhere up the river, and are lightered down to your place?—At Nine Elms, yes.

2722. Suppose there was a railway with a terminus convenient to many parts of London, would not they be in competition with you then?—I should not be afraid of it, because I think our situation near London Bridge is a more popular one.

2723. But it might be possible in the development of business that you could have warehouses in other parts of London. You say for instance that the dock warehouses are not situated in the best possible places now?—I think so, because it is so very costly to get goods up to them.

2724. So that there would be a possibility of competition with the Trust in the form of wharves in communication by railway with these outlying ports?—No doubt. It is impossible to take a monopoly that would not have some danger of competition.

2725. I have only one other question. You have not told us what your proposed legislation would be in order to alter these trade customs. What is the enactment which you would like the Legislature to give you?—Might I give you that later on. I should like to think it over.

(*Mr. Ellis.*) I did not press him upon that because I understood that he was not prepared to frame a clause in an Act of Parliament or a Bill.

Mr. HENRY TAIT MOORE called and examined.

2726. (*Lord Revelstoke.*) You are the managing director of Brook's Wharf?—Yes.

2727. And one of the proprietors of Bull Wharf?—Yes.

2728. Is Brook's Wharf a limited liability wharf?—Yes.

2729. Is it under the Companies Acts?—Yes, under the Companies Acts.

2730. Does it publish accounts?—No, it does not; we have only private shareholders.

2731. You have only shareholders, I suppose, without any issue of debentures or preference stock?—Without any issue of either preference stock or debentures.

2732. Is it held privately?—It is held privately.

2733. And Bull Wharf is entirely a private undertaking?—Yes, a private firm.

2734. Will you proceed with your evidence?—Brook's Wharf is bonded for all goods except tobacco. Bull Wharf is bonded for all goods except tobacco and tea. At the former there is a large business in the warehousing of tea, and the general produce consists mainly of imports from China and Japan. The warehouses are mostly of modern construction, and relying on the freedom of water, additions have been made in the last 15 years at a cost of £40,000. Bull Wharf is of modern construction, and is largely used for the storage of valuable goods, such as shells, indiarubber and gutta-percha, gums and drugs. In each wharf light showrooms of considerable area are provided with lifts, as sample packages of the principal goods have to be shown at periodical sales, attracting besides English, Continental and American buyers. I may say in passing that a very large proportion of the goods that we have do not go for consumption in London. For instance, the shells, I may say, go entirely to the provinces or to the Continent or to America, and the same

largely with indiarubber, and with a great many of the gums and drugs. With regard to tea, I have had a statement got out, and I find that about half of our tea is delivered in London and the other half is delivered for use in the country and abroad. Despatch in the receipt and working of goods, especially for the periodical sales, is of the utmost importance, but it is a constant complaint of the merchants and brokers that the delay in bringing goods up to the wharf is prejudicial to their interests. In the case of China and Japan produce, the ships discharging in London have the competition of German steamers from the Far East, which discharge the cargoes at Hamburg, sending on the portion for London by steamers discharging in the river, or in the St. Katharine Dock. In the case of these we have no complaints of delay. It is fair to say that the direct steamers discharging in the Albert and Tilbury Docks bring very large cargoes, but the system of delivering these partly overside and partly from the quay after the steamer has discharged and moved from her berth, is antiquated and not equal to the requirements of the present times. That it is this method of discharging which causes delay is proved by a table which I will hand in.

(*The Witness handed in a table showing periods of discharging in the Victoria, Tilbury and Albert Docks. See Appendix, 8th Day, No. 2.*)

From this table it will be seen that goods delivered by ships discharging at the jetties in Victoria Dock, or at the "knuckle" in Tilbury, there is no delay, while the time taken in obtaining delivery of general cargo from ships discharging at quay berths is very great. The instances taken are of the average, and may be accepted as fair.

2735. (*Sir John Wolfe-Barry.*) Would you tell me what the "Knuckle" is?—The knuckle is a place at the Tilbury Dock. One end stands out like this, and the ship lies along here, and the barge lies at the end or on the other side, so that we can get continuous delivery

*Capt. H. V. Hart-Davis.*

*Mr. H. T. Moore.*  
—

Mr H. T.  
Moore.

Dec. 1900.

See 2574.

all the time the ship is discharging. The complaints usually made against London are two: (1) Delay in delivering of cargo from ships to warehouse; (2) London charges as compared with those elsewhere. Then there is that further case which Captain Hart-Davis brought before you about the system of weighing in London. As to that, I have a letter from a foreign correspondent of ours with regard to some goods that he sent to us, which I shall be happy to read.

2736. (*Lord Revelstoke.*) I think it is unnecessary to read it. Will you give us the gist of it?—He sent 200 bales of cloves to be weighed in London, and he sent us a cheque for the charges. He made no complaint about those, but he complained very much about the loss in weight. We pointed out to him that our system in London was to weigh and tare them separately. He wrote again, and said that the system in Amsterdam was to tare the cloves 10 bales in the draft. The consequence was that he made a tremendous saving on the weight. Our tare in London was 9lb. His tare for the 10 bales was 78lb. We promised to investigate it, and we did, and then we wrote and told him that we could not help ourselves—that our system of weighing and taring in London was according to custom. In reply to that he wrote:—"We are waiting the result of your investigation before we ship further 1,000 bales to you now ready for shipment, but, of course, if the loss-weight is so heavy we had better re-buy in your market, and leave our cloves here." Owing to our being unable, because of the custom of the trade, to weigh the cloves differently to the system that we had adopted before, we never had that 1,000 bales order. I venture to suggest that the question of delay in delivering can only be dealt with satisfactorily by making such improvements at the docks as will enable the ship's cargo to be delivered as the unloading proceeds. This can, I believe, be done by some outlay in certain of the existing docks. The matter of charges is more difficult, as the docks where the ships discharge are in most cases so far from the necessary destination of the goods for inspection and sale that practically all goods, whether for warehousing at the dock company's warehouses or wharves, have to be lightered. In comparing charges in London with those made elsewhere it is most important to note that this service is included in the landing charge made at the docks and wharves. The charge for this service is an increasing one, and this further increase can only be prevented by an improvement in despatch, enabling a lighterman to get a full freight promptly. May I say in passing that I think in comparing charges between London and Liverpool we sometimes look unduly unfavourably to London, because in Liverpool from the charges I have seen there they display separate items on their account. For instance, they lighter or carry the goods as a separate item for that service, whereas in London the usual rates include the landing, lightering, or the cartage of goods. Therefore the landing rate in London looks larger than it would in other ports. Wharfingers generally occupy costly premises, and their rating is consequently considerable, the increase in this item in the last ten years in the City being 21 per cent. At present they are assessed on the same principle as private occupiers of warehouses, although, from their having to pile goods so that they are always readily accessible, it is impossible for a wharfinger to make anything like so much use of his space. In spite of the incidence of rates and taxes, the increased cost of lightering, etc., on the representation of traders the charges made on goods have been, in many cases, reduced in the last ten years, to the diminution of the profits of warehousing. I have a list here of at least twenty articles on which charges have been reduced in the last ten years. Although we are in agreement with the docks about the rates we charge on certain articles, still the committee to which I belong, with the docks, have had to meet the applications of merchants and reduce the rates in, I should think, no less than twenty cases of the goods in which I am interested alone. There is sometimes an impression, I am afraid, that the combination of docks and warehouses in agreement in London has been to raise the rates. I do not think it is so. I do not think that in the last ten years there has been a single rate in London raised; but we do try to steady things and make them fair, and we have considerably reduced many charges where the traders have pointed out to us that the charges are hitting the trade rather hardly as compared with the competition of other ports. I do not know whether I might be allowed to say with regard to rates and taxes that that question hits us quite as hard as it does the dock company.

2737. Will you tell us what articles you refer to on which the charges have been reduced?—Tapioca and sago have been reduced. Sugar we gave 14 more days' free rent on, and glucose the same. Then canes, gunnies, feathers, Lingah shells—a cheap kind of shell which come from the Persian Gulf. Then come galls, gum, pepper, sardines, honey, and several other articles which are small.

2738. Which is the most important item as regards revenue?—I should think the reduction on tapioca and sugar probably. I have left out the important item of tea, which has been reduced 10 per cent. Tea, of course, is a very large item.

2739. (*Sir Robert Giffen.*) What was the charge before, and what is it now?—The charges have been reduced generally by giving a different discount. In the case of tea they have been reduced by taking 10 per cent. off the rates. We made a 10 per cent. reduction on our gross rates in the case of tea. I have not got the rates with me, but I should be happy to furnish them to the Commission.

2740. (*Lord Revelstoke.*) How long has that reduction been ruling?—Since July. I think the whole complaint among wharfingers with regard to another thing is that in the assessment of our property we are not treated quite fairly compared with some of the private owners. A private owner very often takes a place at the waterside and uses it as a factory, and also to store his goods. It being a factory he gets a third off the assessment, and we as wharfingers get only one-sixth off. The cost of land and buildings in London makes it imperative that the handling of goods should be expedited if the disadvantage of London to other ports is not to increase. I would respectfully submit that it is necessary that the port should be placed under the management of a Trust, representatives of all interests, who should acquire the waterway, quays and sheds of the docks for the discharge of ships, making the necessary charges for docking, &c., of ships, and resume the discharge of all vessels entering the docks. The present dock companies should retain the existing warehouses. I may say that I think that when the docks altered the system after the great strike, when they gave up to shipowners the right of discharging the ships, they deliberately cut off a large part of their income, and, speaking as a wharfinger, I never could see why they did it. They gave up the discharge of the ships to shipowners. Presumably the shipowners make a profit, and the docks had hitherto done it and made that profit. The Trust would undertake the improvement of the existing docks and the addition of further docks as the trade of the port required it, and should the dues from ships not be sufficient the Trust should be empowered to levy an equal tonnage charge on all cargo whatever its destination. At present the shipowners receive 1s. 6d. per ton or thereabouts for the docks for goods warehoused there or at their warehouses. It is to be hoped this addition would not be necessary, as the profit from discharging ships should, under proper management, make a considerable addition to the revenue from docking ships. The duty of the Trust would be to encourage and foster trade to the port. The waterway of the river should be improved and deepened as required, but the cost of this should be borne by the rates in the same way that the cost of a county road is borne by the ratepayers. All means of locomotion should be entirely free. I do not know that I agree with those who have preceded me about the necessity of the river being under the same authority as the docks. I really think the time has come when the great highway of London should be maintained at the public expense. London benefits by the bringing of larger ships to London. London benefits by every facility that is given, and it does seem unfair that the goods which come to London, which are presumably for the benefit of the London trade, should bear the cost of maintaining the river. I think the river should be put on the same ground as a county road—a great highway. The mooring of vessels in the river should be under the control of the Trust, and the Trust should have power to levy dues for mooring. In fact, ships discharging in the stream should be subject to all the charges made on ships in docks, except the dock dues. I gave particulars in the table I handed in, of certain ships discharging at places where we have no complaint of delay, Victoria Docks, the jetties, and Tilbury Dock; and I also gave a comparison of some in the Albert Dock. It has been pointed out to me that I ought to have given

See 2734.

a comparison of the same article. I gave tea at two berths at the Victoria Dock and Tilbury; and I gave general goods at the Albert Dock, so I have had another table made out—which I will hand in—to see if there is any difference.

*(The Witness handed in a table of some tea ships with other cargo discharged at the Royal Albert Docks, with particulars of date of report and arrival of teas by barge at Brooks Wharf. See Appendix, 8th Day, No. 3.)*

I do not find that there is practically very much. The time taken for tea in the first table is  $4\frac{1}{2}$  days, whereas the average at the Albert Dock is nine days.

2741. Is that the principal difference?—That is the same article. In the first table I have put tea in one case, and in the other case general goods.

2742. But you have mentioned the principal discrepancy?—Yes; the time is generally double in the case of discharging at the Albert Docks as compared with the jetties at the Victoria Dock or the "Knuckle" at Tilbury. I have another table which I will hand in. It shows the time taken in discharging some tea ships with other cargo at Tilbury Docks.

*(The Witness handed in a table of some tea ships with other cargo discharged at the Tilbury Docks, with particulars of date of report and arrival of teas by barge at Brooks Wharf. See Appendix, 8th Day, No. 4.)*

2743. We shall be glad if you will put in a statement of the articles to which you refer as having been reduced?—I shall be happy to do so.

2744. (Sir John Wolfe-Barry.) Is there no way of altering the custom of a port except by legislation?—Are you referring to weighing?

2745. Yes?—It occurred to me that it would be one of the most useful things if the Chamber of Commerce took it up, but they have never done so.

2746. I was just going to suggest the Chamber of Commerce?—As a matter of fact we find, dealing with both buyers and sellers, that the buyers in London are much stronger, as a body, than the sellers. The importers do not seem to take the interest in the matter that the buyers do. In the case of tea, some time ago by the half pound, and the Customs for the last twelve months have followed that.

2747. Would not the Chamber of Commerce be the proper body to take it up, if they could be made to take it up?—Yes; I hope the result of its coming out that there are other difficulties standing against London besides the charges may induce them to take it up.

2748. Is not the Chamber of Commerce a body of persons whose legitimate object is to deal with such considerations as the customs of a port?—I should imagine so.

2749. Rather than compulsory legislation on a port which makes its own customs?—I think it would be rather difficult to make compulsory legislation in a matter affecting two parties like buyer and seller. Each would be supposed by the Legislature to be able to look after himself.

2750. With regard to the reduction of rates of which you have told us; have those reductions taken place in consequence of the study of what is going on in foreign ports?—Yes, mainly; and they have been going on over the last ten years.

2751. Do you, or do any wharfingers collectively, employ any staff for the purpose of studying what is done in foreign ports, or do you wait until the matter becomes somewhat intolerable before the reductions take place?—We generally find that those who are affected by our charges do not hesitate to bring them forward as soon as they affect London.

2752. They wait till the shoe pinches?—They do not wait very long, either.

2753. Now, about the discharging of the goods in the river, where the average on your statement is two days, were those goods from small vessels?—Yes; very small vessels, coming from Hamburg. Now we are getting a great deal of competition. A great deal of China cargo comes over in these German subsidised steamers, which discharge part of their cargo at Hamburg, and the balance comes on to London. Formerly we used to get the whole of it to London, and the balance required for Hamburg went there from here.

2754. That condition of things has altered very much in consequence not only of the improvement of foreign

ports, but the foreign subsidised lines?—Yes, but I think the first great help that competition had was in the dock strike, and the consequent rise in the price of lighterage. The lighterage was very much put up after that strike, and the tendency is for it to rise again; and there is still a lightermen's strike going on.

2755. It has never gone down again to the old figure?—No, and we shall be satisfied if it is maintained at the figure we are now paying.

2756. It would not be right for us to assume that the goods discharged in the river from very large steamers would be discharged in the time that you give here for the China goods that come from the continent in small steamers, would it?—No, I should not like to say. I am not practical on that point, but I see in the evidence that has been given that Mr. Becket Hill, and, I think, See 1968-74 Sir Thomas Sutherland, said that it was quite possible and 2259. for them to discharge their steamers alongside a wharf in the stream—specially built, of course, for the purpose.

2757. If the wharves were made deep enough?—Yes, and low down the river.

2758. (Mr. Ellis.) I will ask you just a question or two more about these trade customs. You put before us a letter from a correspondent of yours showing that certain cargo did not come here in consequence of the custom of weighing?—Yes.

2759. Who profits by the existence of the present system?—That is difficult for me to say. I suppose the buyer does, as he gets more for his money than the seller would perhaps think he was entitled to.

2760. I want to get, if I can, where the interest lies in the maintenance of a custom which you describe as inimical to the Port?—It is my correspondent who says that he does not send me a thousand bales in consequence of that.

2761. That is why the cargo does not come to London?—Yes.

2762. Who is the man who profits by the existence of the present system?—I do not think anybody does profit. London seems to me to be so big that one never gets these things brought home. The complaint that is usually made to a wharfinger is: "Your charges are too high, and they are driving away trade." You cannot get a man to sit down and go into the matter, so that you can show him how the thing really stands. We hear sometimes from a seller about this weighing question, but it is very seldom that we hear it. I do not get a complaint of this sort generally.

2763. Then it is nobody's interest really to maintain the present state of things. Is that what you rather put forward?—I do not think it can be.

2764. Then why is it not reformed?—Because I think the buyers are too strong for its being reformed at present. They seem almost to be. I only judge that it is to their interest to maintain the present state of things from the long fight there was over the tea. There was no tea sold in London for six weeks, I think, last year.

2765. Then am I to take it that you are not quite so sanguine as Captain Hart-Davis. You do not think that there would be a sufficient volume of instructed opinion to bring about a reform?—I think there would be if it were once made known. I do not think the public have ever caught hold of the fact that these trade customs want revision in London. I think the buyer goes on, and the seller says, "I cannot help it," and when he has the trade he goes to a port where these trade customs have not got the same strength as they have in London. I remember ten years ago the matter came before us on a question of coffee or cocoa. The complaint made against London was that we charged more for coffee in London than was charged in Havre. We sent to Havre, and we found that in Havre they weighed the bags of coffee in drafts of five, and they tared them in drafts of five. It is an easier thing to weigh coffee five bags at a time than singly. We told the people who complained to us about this, and said, "Can we weigh them in the same way, and then perhaps we can make a reduction?" They said, "No. You must adhere to the London system of weighing." It is outside my business as wharfinger to say how a man shall weigh his goods, but coming before your Commission, I thought it only right to point out that there are these trade customs to my knowledge, which have interfered with me in this particular instance of the 1,000 bales.

2766. Then you would trust rather to an enlighten-

Mr. H. T.  
Moore.  
4 Dec. 1900

Mr. H. T.  
Moore.

4 Dec. 1900.

ment of opinion in the Chamber of Commerce than to a proposal for legislation?—I should attach a great deal more importance to it if the Commission could satisfy itself that that was one of the causes of the loss of trade in London, and could put it in their Report that one of the causes of the loss of trade in London was owing to these trade customs. Then I think the fact of this Commission having given its Report in that way would carry its weight with the Chamber of Commerce, and they would probably take it up, but my statement would not have that weight. It would be passed over.

2767. Do you think the disadvantages of the Port of London are increasing as compared with other ports?—I do not think I have found it so, except with regard to certain steamers which discharge at the Albert Dock on the quays. There, from the size of the ships frequently one steamer, as soon as it is discharged, has its berth taken by another steamer. With regard to those ships that discharge in that particular part of the Tilbury Dock, I think there has been an improvement in the last five years.

2768. Then you said, "The duty of the Trust would be to encourage and foster trade to the Port." Would you amplify those words a little? What do you mean by them?—The complaint of shipowners at present is that the river is not deep enough. The first duty of the Trust would be to put pressure on the authorities who are responsible for the river to make it all that it should be. The Trust should own the quays. I would separate the docks and the waterways from the existing warehouse business, and I would give the Trust the ownership of the water and the quays. They should work simply as economically as possible, not for the purposes of a profit. We should expect more from them than we should from a dock company.

2769. That is rather what I wanted to come to. We will pursue that question. Looking at it from a financial point of view, the Trust would, I apprehend, have a debt?—Yes.

2770. On which it would have to pay interest?—Yes.

2771. It would have certain expenses?—Yes.

2772. Where would it get its revenue?—First of all in the same way as the dock companies get their revenue—from the waterway, from ships, and from dock dues; and, secondly, I suggest from the discharge of the cargoes, by giving up which, I think, the dock companies gave up part of their income. They should resume it. And, further, if it is necessary—which I hope it will not be—they should make an equal charge of so much a ton upon all goods, but I would have no tax upon locomotion make the incidence of the rates equal. An equal in its incidence. If I had a 50-ton barge with only 20 tons of freight in it, according to the dock companies' proposal, you would tax the barges according to the tonnage of the barge, and I should have to pay as if I had 50 tons in the barge. You cannot by taxing locomotion make the incidence of the rates equal. An equal tax on goods, whatever they were, I think, would be fair. Of course, at present, if it is left to the dock companies to put on such a charge as that they, as warehouse keepers, might include that charge in their warehousing charge.

2773. I am rather trying to get at the policy that is in your mind. Ought the Trust to bear in mind primarily encouraging or fostering trade, or the duty of making a balance sheet?—They should first of all foster and encourage the trade.

2775. But supposing that was insufficient, what is themselves able to levy, having regard to that primary duty, fell far below what they had to meet on the other side, interest and expenditure, where would the deficiency come from?—They should tax all goods equally.

2776. But supposing that was insufficient, what is their third line of defence?—If you put a tax on goods coming to London, if you get the dock dues and the discharge of the ships—which is the second line of defence—and also get a tax upon the goods, I cannot imagine, unless the Port of London is going to decrease its business by half, or more than that, that there would be any other line of defence necessary.

(Lord Revelstoke.) I do not think that was quite Mr. Ellis' question. Mr. Ellis asked you in the event of these items being insufficient, where would you raise the balance of income?

2776. (Mr. Ellis.) Do you really put it before us that they would require no other line of defence, as I have called it?—I think not, if they had a right to tax goods.

2777. Have you worked it out?—No, but I know that there is a tonnage of nine or ten million tons a year coming to London.

2778. You are clearly not in favour of any suggestion such as we have heard of—a rate from the community?—I do not think it should be necessary in the case of docks, which exist, after all, for the ships.

2779. I am speaking of the Trust. You will quite understand that I am not indicating anything in my mind. I am only wanting to get at what is in yours?—At the end, if the dock dues on ships and the charge on the goods did not prove sufficient, then I think the rates should bear it. I think it should be a charge upon the rates in the same way that the improvement of the waterway and the river should be a charge on the rates, but I do not think it would ever come to that.

2780. But you do think that the Trust should have power—in the background, or in the far background, if you like—but somewhere it should have the power to derive a revenue from rating?—Yes, I think it should, but it would be in the far background.

2781. (Rear-Admiral Hext.) With regard to lighters, you think they should not be charged?—I think they should not be charged at all. I do not see how the incidence of any tax upon them could be made fair.

2782. But suppose the Trust you contemplate made alterations in their docks, with greater facilities for lighters, which would enable lighters to take one or two more cargoes probably than they do at present?—I think it would be better to put a charge upon goods equally.

2783. If these facilities were given for the lighters loading, they would naturally load more quickly, and return more quickly for another load?—Yes.

2784. Then practically the owners of the lighters would be paid for their extra cargoes, and yet pay nothing at all for the facilities?—Not as barges, but the cargo that they take might bear it.

2785. If the owners of the lighters took so many more cargoes they would naturally be paid more for carrying those cargoes?—Yes.

2786. And, therefore, after having received those increased facilities, you still propose that they should not pay anything towards it?—Not as barges, but the goods that they take away might be charged an increased tonnage rate.

2787. And the owners of the barges might be making a double profit on their capital?—No, the result would be this, I think. If the barges were able to get larger freights and to get them more quickly than now, we should be in a better position to reduce charges, or to stop them from increasing, which would be a great thing for the Port of London.

2788. That you say is probable, but still at the same time the owners of lighters would probably, as the thing stands at present, earn considerably more money without being taxed at all?—If they were earning more money, there are a great many of them, and competition would soon bring down their rates. If any lighterman had increased facilities, and did more work than he does without lowering his price, it would be open to me to do my own lightering. Competition would always keep a lighterman's charge down to a fair level, but I should like to point out that if you tax barges a 50-ton barge very often goes up with only 20 tons in her, and she would have to pay  $2\frac{1}{2}$  times as much as if she had 50 tons in her.

2789. The question is whether the barges should not pay something irrespective of the cargo they carry. I am trying to separate the two. The barges will receive increased facilities, which will cost a great deal of money and expedite their trade. I do not think it is necessary to calculate the amount of the goods they carry. There might be a tax on that lighter of 50 tons or 100 tons?—If you did that every lighter would wait until it got its full load, and the great disadvantage of delay would be very much increased. Every lighter would wait for its full load if they had to bear a tax.

2790. That does not apply to a waterman's boat which is licensed to carry twelve. He has to pay for his licence if he starts with only six?—As a matter of fact, the railways tax passengers. We pay a passenger tax, but there is no such thing as a goods tax.

2791. You referred just now to the facilities for loading at wharves, and you quoted Sir Thomas Sutherland's evidence. In your experience does not the rise and fall of the tide interfere to a certain extent with a ship alongside,

of a barge alongside, loading or unloading. Would it not be better to unload at a fixed level?—No doubt there are advantages in the docks in the matter of loading.

2792. Does not the rise and fall of the tide to a certain extent put you in a worse position for loading and unloading, than if you had the water on the same level?—We do not find it so with unloading goods in the stream.

2793. When loading goods in the stream you are on the same level, the ship rises and falls with the tide, and the wharf does not rise and fall with the tide?—I would not like to give an opinion on that. I simply quoted Sir Thomas Sutherland as having said it would be possible to do it. I have not practical experience enough to say, and I should not like to say, as I have no experience about it.

2794. (*Sir Robert Giffen.*) When you speak of an equal tax on all goods, do you mean an equal tax according to weight, or *ad valorem*?—According to weight entirely.

2795. So that tea should pay the same rate as galls?—Yes, exactly. The reason for that is this: We find practically in our China goods that the competition of these foreign ports is in the finer class of business—this stuff that comes from China. In bristles and hair, and valuable cargoes of that sort, we have more competition to stand than in the case of a commoner article, which comes to London, and has to come to London to be consumed.

2796. Then the greater charge might mean nothing upon tea, and a great deal upon other goods?—Yes.

2798. But I think that some shipowners have given us were unwise in giving up to shipowners the privileges of discharging their own ships, because it was a business out of which the dock companies made money?—Yes.

2798. But I think that some shipowners have given us a statement that they paid less to the dock companies than the discharging of ships costs them since?—Yes, that may be so, but I look at it rather from the point of view of what is good for the Port, and I am inclined to think that a Trust, looking at the thing all round, would probably be able to make better arrangements for the discharge of ships than the shipowners can. What

Mr. GORDON COOMBE called and examined.

2806. (*Lord Revelstoke.*) You are senior partner in the firm of Gordon Coombe and Company?—Yes.

2807. You have had 23 years' experience of the working of the Port of London?—Yes.

2808. And you are Vice-Chairman of the Wharfingers, Warehouse Keepers and Granary Keepers' Association, of the Port of London?—Yes. My experience is entirely limited to trade in connection with grain—what is generally called the granary keepers' trade. I have had no experience as a general wharfinger. The granaries on the river, in addition to being no mean proportion of the whole waterside, are taking an ever-increasingly important part as central depôts for the distribution of food stuffs imported to London, by vessels going principally into the Victoria and Albert Docks. These granaries are practically all situated within a mile and a half of London Bridge, and it is absolutely essential that the very large proportion of the flour and grain stored in, and passed through them, should be handled as near the centre of the Metropolis as possible, for the following reasons:—First, with regard to flour: this is nearly all taken from the granaries by vans, and the cost of collection and delivery is proportionately more as the distance from London Bridge increases (after a radius of about a mile and a half), and, in cases where delivery is to the City or West End, police regulations make it compulsory that the vans must deliver before 9 or 9.30 a.m., and in other districts where no such regulations exist, many bakers will not take in flour after 9 a.m. It would be impossible to comply with these requirements if the flour is stored in the lower docks. On most days more vans are loaded at granaries with flour between the hours of 6 and 8 a.m. than between the hours of 8 a.m. and 6 p.m. Next as to grain, various cereals and articles manufactured from cereals: large quantities of these goods are handled at riverside granaries, and the chief reasons for this are:—(1) The desire of the merchants to have their goods near the market for convenience of despatch in obtaining samples and inspection by buyers; (2) Merchants dealing in a variety of articles are enabled, by putting all their goods at a granary, to supply buyers with small quantities of various goods, which, if lying at different docks, would entail great expense and delay in collecting together to form one consignment; (3) Many of these goods are sold to small traders in the suburbs,

happens very often is this. A shipowner is in a hurry to get his ship out, and the men strike for more money. The shipowner gives way to them. That has been the cause of a great many delays in London in the last ten years; there have been constant little strikes. If the men were all employed by the Dock Trust there would be one great strike, or there would be peace.

2799. So that the dock companies have lost by the change, and the shipowners have not gained?—I think it is very likely that that is the case.

2800. And this is the reason why a Dock Trust could work to better advantage than an individual shipowner?—I think so. There is a reason for that. In the case of a shipowner employing his own men, if he has no ship coming in, his men are not at work. They would naturally when at work require higher pay.

2801. (*Mr. Ellis.*) They cannot be transferred?—No, they cannot be transferred. A dock company, or a dock trust, I take it, would be better able to give regular employment.

2802. (*Sir John Wolfe-Barry.*) Was not one of the great reasons for adopting the alteration with regard to the discharge of ships, to avoid the danger of a universal strike of labour in the Port of London?—Yes, and perhaps it has avoided a universal strike, but it has left in its place these constant delays and troubles—partial strikes, which are almost worse, I think, than a general cessation, because a general cessation in London soon brings a thing to an end, while these partial strikes seem to go on without end. The present lightermen's strike goes on, but everybody is doing a certain amount of work.

2803. Whether the policy was right or wrong, that was one of the main reasons for the alteration?—Yes.

2804. And you personally think it was a mistake?—Yes. I think it is a mistake for any of us to be dealt with in detail by workmen or anyone else.

2805. You think it was a mistake from both points of view—from the point of view of the dock companies sacrificing income, and from the point of view of the interest generally of the Port of London?—Yes, I think so.

who keep their own horses and vans for collection, and these traders insist on buying at granaries because of the short journey, as they cannot afford the loss of time and expense incurred by having to go to the lower docks; (4) A proportion of these goods also go to the southern rails, and the cost of cartage from the granaries is only about one-half the cost from the lower docks, and even then cartage contractors object to this long journey work, and only care to take it in conjunction with the shorter journeys. Then, going to the question of granary charges. The charges on goods that go to granaries are almost the lowest of any in the port. I should just like to emphasise that, because it has been always an understood thing in our trade that we have a very low scale of charges for all goods that we handle—far lower than the charge by the general wharfingers, as we term them. The cost of lighterage, which is generally felt to be far too heavy, in some instances absorbs 50 per cent. of the total charge. It would, therefore, be absolutely impossible for the granary trade to bear any extra expense in collecting from the ships, and should any impost, however small, be put on the barges using the docks, it would at once become an additional cost to the consumer. In the Bill recently presented to Parliament, the London and India Docks Joint Committee proposed the following charges—

2809. I think we will not go into that now?—May I touch on the barge question at all?

2810. I think it will be unnecessary?—I have been reading the evidence that has been given here pretty carefully, and I have a note here of one or two things that have been said, more particularly by the Surrey Commercial and the Millwall Dock Companies. I have not much to say about the evidence of the Joint Committee, but witnesses for the other dock companies that I have mentioned seem to have been using a phrase, probably by mistake, which would convey a wrong impression to your minds.

2811. Does it touch your particular business?—Yes.

2812. I think you are at liberty to tell us anything which touches your business directly, without going into the general question?—In the evidence given by both the Millwall Dock Company and the Surrey Commercial Dock Company, I take two particular examples out of many. I will refer to Questions 1066 and 1102

Mr. H. T. Moore.

4 Dec. 1900.

Mr. G. Coombe.

Mr. G.  
Coombe.

4 Dec. 1900.

in the Millwall Dock Company's evidence. This is in the answer to Question 1066: "For instance, this matter of dealing with the barges is one of great importance to us, because we are dealing with goods and we are dealing with trade, and we are spending money for which we do not get one penny in return. Whether it ought to be in the shape of charges on craft or otherwise I am not prepared to say." That would apply equally to several answers given by the Surrey Commercial Dock Company, but they do get a charge on all this overside grain. I am not speaking of timber, of course; but on all the loose grain they get a charge which is admitted by them to be a very handsome charge. The officials of the Surrey Commercial Dock have admitted to me that they make money over it. In connection with that, perhaps I might hand in a statement of the charges made by them for grain.

(The Witness handed in a statement of dock charges on grain in the Millwall and Surrey Commercial Docks. See Appendix, 8th Day, No. 5.)

You will see they say, "The following rates will apply to the undermentioned grain and seed in bulk discharged or landed in the Surrey Commercial Docks." They get this discharging rate for working grain out of a ship, whether it is landed in the dock or delivered to my craft, or anybody else's craft. It ranges from 1s. 9d. a ton on heavy grain to 2s. a ton on light, with an intermediate charge. I got those papers from the dock companies myself.

2813. (Sir John Wolfe-Barry.) Is it the same at the Millwall Dock?—To all intents and purposes, the charges for grain are the same at the Millwall Dock.

2814. (Sir Robert Giffen.) Are they the same at the Victoria and Albert Docks?—Yes, but as a matter of fact, the Victoria and Albert Docks, I believe, discharge very little cargo themselves. But those two docks, the Millwall and the Surrey Commercial, discharge, I think, the whole of the loose grain which comes into their docks, which is a very large proportion of their trade.

2815. (Sir John Wolfe-Barry.) Do they supply the labour?—Yes; and they supply the machinery. That brings me to Question 1115, where the Millwall Dock witness spoke about their dolphins. Rear-Admiral Hext asked that question: "With regard to the dolphins, you stated that they were placed there for the convenience of discharging grain from ships into lighters?" (A.) Yes. (Q.) And therefore, to a great extent they are placed there for the convenience of lighters, as well as for the convenience of ships? (A.) Yes; that is so; grain and general cargo." I would rather like to suggest there that I hardly think it is a fair construction that he has put upon that dolphin question. They have a very large business in discharging grain ships, and I should suggest that those dolphins were simply put there to enable the company to do a paying business in a probably more paying way by putting better machinery, exactly in the same way as I should put better machinery in my business if I thought I could see my way to do it profitably. I do not know that the Millwall Dock Company's figures with regard to the amount of grain and the craft could be taken as correct. That is Question 1134. The witness says: "It entails great expense, and takes away a very large amount of goods that otherwise would come to the dock, and we get nothing for it."

2816. (Lord Revelstoke.) That you are disinclined to agree with?—He said they get nothing for it. I think I have tackled that; but where he says that we take goods that would otherwise go into the dock, I cannot agree with that. My argument against that would be that we only take goods for lightering, not to our own warehouses, but to any other given point, for the convenience of the merchant; or else we take them away in a barge for storage in our granary. We only take goods that the merchant, for some reason of his own, is compelled to give to us, from the Millwall Dock. The Millwall Dock Company would not get them on equal terms. As a matter of fact, the terms are already slightly unequal for short periods.

2817. The point being that you get the business, but you do not take it away from Mr. Trotter?—Certainly not.

2818. You do get the business?—We are bound to get a certain amount of that business, but we do not take away business that would in any way go into his warehouse by our barges going there. While we are on this question, I should like very much to ask this. Possibly some member of the Commission can explain it to me. I cannot understand the answer given by the Commercial Dock Company at Question 1794—

2819. We cannot go through the whole of this evidence?—It is only with regard to the way the Surrey Commercial Dock Company divide their accounts into three heads.

2c20. They will have perhaps an opportunity of explaining that later. We cannot very well go into it now. Perhaps you will go on with your evidence?—The next point is with regard to taking delivery from ship. A great defect in the present working of flour and grain in the port is the fact that many goods are delivered to the receivers direct by the employees of the shipowners. This is a practice that should immediately be abolished, as the tendency is for all weighing to be "too close" (this is more noticeable in the case of loose grain), and with bag goods obstacles are put in the way of time being given to the receiver for the detection of damages and checking the weights of slacked and ullaged bags. These matters are daily becoming more serious and greatly adding to the difficulties of the business; it is felt most strongly by both merchants and granary keepers that an independent authority should take goods from the ship and deliver to the receivers. I should like to say a little about that. Going back to when I first came to the waterside, it had begun to be slightly altered then, but the original arrangement for discharging grain was for a body called the City Meters to do the weighing, and for many years after I had connection with this business ships used to come in and discharge their goods, and the City Meters weighed. This weighing was always, we considered, well and impartially done. Then the Millwall and the Surrey Commercial Dock Companies took to having the ships coming into their docks for discharging, and they took to doing the weighing. How that was I do not know. We did not consider that was satisfactory. Now the shipowners in the case of the lower docks have taken to discharge the goods to us, and we consider that this is very unsatisfactory. The ship's employees are undoubtedly endeavouring to do the very best they can for the ship, which we must assume is perfectly natural, but at the same time we consider that they are one-sided in their dealing, and it makes the business very difficult. We consider that in taking goods from ships we should have an impartial authority to stand as between the ship and receiver for all goods—loose grain, bag goods, or others—and if there were any question of a Trust we consider that that should be one of their duties. Then with regard to the working of the port generally, there is a feeling among many persons who have the interests of the port at heart that the opinion of persons competent to judge should be taken as to the practicability of building a set of locks across the river at Gravesend, by this means to keep ships and craft of all kinds always afloat above that point. It is also suggested that this would materially cheapen the cost of lighterage and do away with many of the dangers at present attending navigation, by removing the necessity for the greater part of night work. I have a little to add with regard to the question of the Trust. I should like to say that the river, the docks, and working out of ships, should come under the control of a public body; and that the river itself should be kept out of rates the same as any highway in the Metropolis that is for public use.

2821. Do you suggest that the Corporation should have control?—I should not like to make suggestions of that sort. Captain Hart-Davis has been here before me, and I think he has studied these subjects more deeply than I have.

2822. Would you advocate a public body being appointed?—Yes, more particularly for those three things, the river, the docks, and the working out of all the cargoes. The river itself, if it is possible to make a separate account of it, so to speak, should be kept out of the public rates, the same as any highway in London. The docks should be kept up and worked by a tonnage charge imposed on all goods, whatever their destination. Then with regard to separating the docks from the warehouses, which seems to be a very difficult question indeed, what occurs to my mind is this: I am inclined to think that these should be all taken over, if possible, and owing to the difficulty of leaving these two large interests on a fair basis, a very slight alteration of the present position might practically ruin one or the other. What I fear as a granary keeper is that we should be left in such a position that we could not keep our granaries going owing to being put in an impossible position with regard to rates. We already have to work at the same rates as the docks, and pay out a large proportion of our charge for lighterage. Assuming that the warehouses now belonging to the

docks are to be left on their hands to trade with, it will require the utmost care to arrive at a just and equitable basis on which they and the existing riverside wharves may both continue to do business and live. We have no objection to a charge on all goods if collected by a public authority, and if care is taken that the charge is collected impartially, whether goods go to lighter for transshipment, or lighter for wharves, or are given to the dock company to store, but we cannot—I am speaking for the granaries—see any justice in the arrangement mentioned in Question 1966 or Question 2029—that is where the dock companies suggest a charge on goods except those going to their premises—and we cannot submit to anything that will alter the free access of wharfingers' craft to obtain goods on the same terms as lighters would collect from the lower docks for storage in warehouses of the upper docks of the company.

2823. (*Lord Revelstoke.*) Are the Millwall Docks the only docks which are in competition with you as far as trade goes?—We are in competition with all the docks.

2824. But it is more especially Millwall, is it not?—We should say that the Millwall and the Commercial Docks are our main competitors.

2825. Although the Millwall Docks do a certain amount of general trade as well?—Yes. As a matter of fact I do not pretend to go in for a great deal of loose grain in my business, for the simple reason that we cannot very well compete with the Millwall and the Commercial Dock Companies' charges for loose grain. Their charges for the first 21 days are utterly impossible for us. We cannot touch them.

2826. Then you would not separate the docks from the warehouses in any scheme that you suggest?—If I could see an equitable basis of carrying the thing through without it I would rather see it without, but it seems to me a very difficult thing to separate them.

2827. You do not suggest separating the docks and the warehouses?—I should not mind it if I could be perfectly sure that it would leave us all on an equitable working basis.

2828. But do you think it would be practicable to do so?—It is a very difficult point, I consider.

2829. (*Sir Robert Giffen.*) You spoke of the charges on grain being low compared with other charges in the Port of London, and you said that they must be low. What would you say to an equal tax upon all goods according to weight?—I do not think that it would do any harm.

2830. You think that an equal tax might be found that would not be too high on grain and yet would bring in sufficient money for the purpose of the Trust?—I do not think it would do any harm if it was the same for every article that comes into the grain market. If everything had to pay exactly the same charge I do not think it would do any harm.

2831. And yet it might be a charge that would bring in sufficient money for the purposes of the trust?—Yes.

2832. You say that the warehouse must be, if possible, near the centre—near London Bridge?—Yes.

2833. And you gave us illustrations with reference to the importance of bringing goods up from the lower docks. But would it not be possible for some purposes to have warehouses even higher up the river? What I mean is this: You speak of it as if the competition was between the neighbourhood of London Bridge and the lower docks alone; but is there not a possibility of trade developing a good bit above London Bridge?—It might do so. I have one wharf just above London Bridge now.

2834. And there are wharves a good bit above London Bridge?—Yes, there are, but the Embankment has taken up a great deal of room that might have been used for wharves there.

2835. You speak of goods going by the southern railways being carted from your wharves to the railway stations; but is it not the case that some of the southern lines have wharves upon the river itself?—We lighter to the riverside depôts of some of the southern railways.

2836. So that the goods if necessary could be brought from the lower docks direct to the railway depôts themselves?—Those would have to be in comparatively large quantities.

2837. Still, for that purpose the lower dock would almost be quite as conveniently situated as your own wharf; it would simply be one lighterage from your own wharf to the railway depôt instead of two—first to the

wharf and then to the railway depôt?—I do not think so. They leave my wharf in a van in comparatively small quantities, and you cannot lighter in such small quantities as you can cart.

2838. Then where is the lighterage between when the goods go to the railway depôt?—I am not talking of lighterage in connection with railways at all.

2839. I think you mentioned that in reply to my question just now?—I am afraid I misunderstood you. I am afraid I did not quite follow your question for the moment.

2840. You speak of the necessity of having wharves in the neighbourhood of London Bridge, which, of course, is obviously convenient to some extent; but I was inquiring whether for some purposes you could not have lighterage from the lower docks to the railway depôts, which you say you serve by your vans direct to rail now?—I lighter direct to rail now for some things, but it is in large lines. It has to be a whole barge load at a time. I do that at the present time, but I am speaking now of the convenience of getting small quantities away from my place to the railway.

2841. (*Rear-Admiral Hext.*) With reference to your proposal of a dam across the river at Gravesend, you said it would remove "the necessity for a greater part of the night work." What do you allude to as "night work"?—The lighterage night work and general night navigation.

2842. The navigation of the river?—Yes.

2843. (*Mr. Ellis.*) You spoke of "taking delivery from the ship." Is that system that you indicate, of delivery direct to the receiver, growing?—In the American trade the system has grown very fast (in spite of opposition by the merchants) of shipowners taking the discharge into their own hands.

2844. And delivering direct?—Delivering direct without any third person.

2845. The elimination of the middleman?—I should hardly put it in that way.

2846. Will you use your own words: "deliver direct," will that do?—The ships employing their own labour to deliver the goods.

2847. "Direct to the receiver" is your phrase, I think?—Yes; "direct to the receiver."

2848. Then I suppose if it is growing, the shipowners find it answer and the receivers find it answer?—The receivers have always grumbled, and they have tried to stop it.

2849. What is their grievance?—Their grievance is to a great extent the grievance that I stated.

2850. Then do you appear as a receiver?—I appear as a receiver on behalf of merchants; I actually take goods into my own craft.

2851. You are covered by the word "receiver"?—Yes.

2852. Then you, speaking now as a receiver, would prefer that it should go through the merchants, would you?—I want to see an independent authority handle all these goods between the ship and myself.

2853. But you say something is changing in the trade, and I want to get at that. Are you now receiving direct the stuff that you received before through somebody else?—Yes.

2854. And you would prefer to receive it through that somebody else?—Yes.

2855. I am not sure to begin with whether this comes within the terms of our reference. This is a custom, is it not?—It has become a custom.

2856. It is one of the things to which the last witness referred under the general head of "trade customs." Customs change and this is a changing method of conducting the trade, is it not?—Yes.

2857. If it is changing, is not somebody interested in the change, or why is it changed?—The shipowners have changed this.

2858. Then the shipowner is doing something for his own interest which you think is an injury to the trade?—That is undoubtedly the case, as I can explain to you very clearly. This innovation came in some years ago under what they called the London clause. When freight is paid an extra charge is imposed of 1s. 6d. a ton on our goods; in fact, they have issued a notice that they are going to make it 1s. 9d. now—another 3d. expense. They collect this charge. They took this 1s. 6d. and they gave us 72 hours. They said "We will put all the goods out to sort; you can take 72 hours before ap-

Mr. G.  
Coombe.

4 Dec. 1900

(Mr. G.  
Obcombe.  
4 Dec. 1900.)

plying, and then apply, and take your goods." The trade objected very much indeed; as a matter of fact there was a law suit, more or less friendly, fought over it. The Secretary of the Wharfingers Association, I believe, has evidence to give you about that. The flour trade, who fought it, lost the day. I believe, to put it in very ordinary language, the judgment was "you have accepted a bill of lading with those terms in it, and you can have no help."

2859. Then something is going from A to C now which used to go through B, is not that it?—That is so.

2860. Does the elimination of B conduce to more rapid despatch?—No.

2861. You are sure of that?—Quite.

2862. Generally we find if something has to pass from A to C, and B is there, the three persons will take more time than the two will?—My reason for giving you that answer would be this: when this London clause came in or at about that time, it was then that the ships took to discharging their own cargo alongside a hired quay. That is where the delay comes, because they put the cargo of one ship after another on these quays, and we not only have to wait 72 hours, but in some cases we have to wait for 14 days before we can get our goods.

2863. Then you clearly put it before us that for reasons good to themselves the shipowners have changed the method, and are sending their goods direct, which you, as the receiver of those goods, consider an injury to the Port, and you would rather that they came through the merchants?—Yes—through B—through the third man.

2864. But would you rather go back to the old system of the merchant?—We never took them from the merchant.

2865. You would rather go back to the old system?—Yes; we would rather go back upon the old system.

2866. You do not like the new system?—No, we do not, nor do the merchants.

2867. But the new system answers the purpose of somebody, and that is the shipowners?—Yes; the merchants will be giving evidence, and I think they will tell you exactly the same.

2868. But you are parties to it. How is it that the shipowner has such power as to be able to alter the method of conducting the trade to your disadvantage; you are a party to the bargain?—Because they combine.

2869. And you cannot?—I can only take the documents that are given me by my customers.

2870. Now you say: "This practice should be immediately abolished." How do you propose to abolish this practice?—I believe the practice is practically abolished in Liverpool, or there is a practice in Liverpool going on that we should be prepared to adopt in our trade, and that would abolish it.

2871. You would like to see it abolished?—Yes.

2872. But I want to get at the method of abolishing it. Did you hear my questions to the last witness about legislation, and so on?—Yes.

2873. I am on the same line of thought. You submit to us that this new method is so serious a disadvantage that steps ought to be taken to abolish it by legislation?—Yes, I do, and I think you would find that the corn trade, with which I have to do, would fully bear me out in that.

2874. You do not think, rather following a suggestion of my colleague, Sir Robert Giffen, that the Chamber of Commerce might take this up effectually?—No, I think that would be too slow a process.

2875. You would like it done immediately, you say?—Well, not to go at it like a bull at a gate, but if there was a Trust which was worked at all on the same lines as Liverpool, this practice would be done away with at once.

2876. Do you think if a few lines were put into a Bill doing away with it at once, anybody would raise their voices against it?—The shipowners might have something to say about it.

2877. And the other interests?—They would probably like it.

2878. Not the dock people?—I do not think they would object.

2879. Then you would rather suggest that it would be a matter that would not provoke much opposition?—I do not think it would.

2880. (Sir John Wolfe-Barry.) I rather gather that what you suggest is some method of reverting to what

was done when the City weighed the corn; is that what you suggest?—Yes. I mentioned the City Meters in this way, that they did come between the buyer and seller, and gave what all parties believed to be an equitable distribution of the goods.

2881. That is not what we understand by a "middleman" so much—a man taking a profit—but a man doing service as a kind of arbitrator between the two interests?—You will understand that somebody has to do this distributing, and we want to have an independent person to do it. "Middleman" was rather a term that I objected to. I did not quite know how to handle that word.

2882. (Mr. Ellis.) I think I was the author of that phrase, and it was a wrong phrase to use. Your own phrase was "independent authority." That is what you mean?—Yes.

2883. (Sir John Wolfe-Barry.) In old days that would have been done by the labour of the dock companies, would it not—before the alteration was made giving the labour to the shipowners?—Yes, the dock companies would do the weighing then.

2884. That would be the idea that you have in your mind as an improvement?—We go further than that. We rather maintain that the dock companies, who are competitors of ours, should not be weighing goods to us on the one hand and into their own warehouses on the other. I make no charge against them, of course. I do not mean to do that; but I do not think it is a nice system to have, and we do not like it. It is felt that it is rather an improper system. There is one man weighing for the masters, and weighing for someone else.

2885. Is it done in Liverpool by what is called the Master Porter?—The weighing is done, I think, there by the port authority. The merchants will be coming here from the corn trade, and they will have plenty of evidence to give you in detail about it.

2886. Just for the purpose of reference, would you give us the amount of business you do in grain?—Personally?

2887. Personally, and also by the association you represent?—I could give you the collective figures that we have got from the granaries on behalf of the association, but I should not like to give any individual business alone, nor should I like to give my own.

2888. I mean the association you are representing?—The Secretary has no doubt figures which would help you in that. I have never taken them out.

2889. We should like, when we are considering the evidence, to know the amount of the trade which you represent when you give evidence before us. Perhaps you can put that in?—I will make a note of it and try to get it.

2890. (Mr. Ellis.) You have not got the figures now at hand?—No; I do not think we have them here.

2891. (Sir John Wolfe-Barry.) I do not notice any complaint of delay in delivery of goods in your statement?—Well, I was rather cut short, if I may use the term over that. I was going to mention the delay in the clause which it was suggested I had better not go on with. I can go on with the question of delay without giving the other part of the clause, if you will allow me to do so.

2892. If you please?—The delay would come in in the cost of lighterage. I had it in my mind to say that we consider that the delay in getting the goods, so far as our trade is concerned, is on the increase. I had a very serious discussion with my lighterman not very long ago. He was talking about putting up the price under my lighterage contract. He was very emphatic—in fact, I think I had it from him in writing—that the proposal to put up my charge was not in any way due to the detention of craft on our part, but was entirely due to the longer time it took to get the goods collected into the barges at the docks.

2893. I will not ask you questions as to the construction of locks across the river, because it touches a very important engineering question on which I suppose you would not feel yourself competent to give evidence?—I was hoping that you would not ask me any questions upon that. I simply threw that out because I was particularly requested to mention it by people at the waterside, but I am not competent to give evidence upon it.

2894. I suppose we may take it for granted that you would not like to do anything to damage the river?—Most certainly not.

Mr. JAMES ARTHUR HUMPHREY called and examined.

2895. (Lord Revelstoke.) Will you give us your evidence?—I, jointly with my brothers, am a freeholder of New Hibernia and West Kent Wharves, which were erected by my father, the late Alderman Humphery. I am also a partner in the firm trading as the proprietors of Hay's Wharf, who are lessees of Hay's Wharf and Dock, Beal's Wharf, and Cotton's Wharf, Hay's Dock being the only private dock in the Port of London. This dock can take ships drawing 17ft. of water at spring tides and 15ft. of water at neap tides. The dock and warehouses of Hay's Wharf were built by my father, and have since been added to by my firm, at an outlay of over a quarter of a million sterling.

2896. Is this the same Hay's Wharf as that about which we had the pleasure last week of hearing the evidence of Mr. Colin Smith?—Yes; he is my partner. This outlay was made on the faith of the water in the different docks being free, and I would point out to the Commission that the dock companies, in laying their capital out practically at the same time, did so well knowing that the water in their docks was free.

2897. In their docks?—In their docks. I have brought some photographs of the property. (The Witness handed in photographs of Hay's Wharf and Dock.) I thought the Commission might like to see the magnitude of the warehouses that have been built. I have been actively engaged as a wharfinger since the year 1855, and my father and great-uncle before me, extending back for 200 years. With respect to the improvements required in the Port of London, there is no doubt that, taking into consideration the ever-increasing size of the ships now being built, better accommodation is absolutely necessary. I believe suggestions have been made as to the possibility of making quays along the riverside, with creeks running up at intervals, so that goods could be landed and sorted and delivered to the different consignees' craft from the sheds which it would be necessary to erect. This would apply equally to goods for exportation coming by water. I am not an expert on this subject, but as it is done at Antwerp most successfully, it naturally strikes anyone that it might be done in the Thames, certainly for a large proportion of the ships using the Port of London, by which means the expense and time of docking and undocking would be avoided. Railway accommodation could also be arranged by having a line running along the back of the proposed sheds and creeks. I am of opinion that if something of this kind could be feasible, and that these quays, and also the docks themselves, were placed under the control of one authority, leaving the present companies their warehouses, greater facilities would be obtained, and the cost reduced. I would also like to call attention to the abuse the licensed lightermen are at the present time making of the monopoly they enjoy. Here is a body of men able to earn from three to four pounds a week on the present conditions, attempting to impose terms which would increase the cost of this work at least 25 per cent.; in fact, we do not know what would be the result if their demands were complied with. The wages they now receive come out 50 per cent. of the amount charged for lighterage, and we, who have to employ these men, ask that their monopoly may be abolished, and the control and management of all matters connected with the river be placed in the hands of the Thames Conservancy Board, who already have a partial control, and any offences committed by the men dealt with in the police-courts, and not by the Watermen's Company. One thing, however, has been most clearly demonstrated in the course of the present strike of lightermen, namely, that had it not been for the efforts made by the master lightermen to clear the dock quays, the discharge of ships would have been impossible, and the whole trade of the Port of London would have been at a deadlock, thus showing the enormous importance of the lighterage of goods, as without that system the dock companies would be unable to carry on their business. If a charge is made on goods coming in or out of the docks, it would most seriously affect the cost of food. The market for butter, bacon, lard, cheese, etc., is in Tooley Street, and all these articles are inspected and stored there. Expensive refrigerating machinery has been erected on the spot for this particular trade, and naturally, if more has to be paid on the goods, it must increase the cost to the consumer. The cheapest mode of conveying the produce to this market is by water, and it is

the most expeditious form of transit. This has been demonstrated times out of number. In conclusion, I have been at the waterside for nearly half a century, and can say without fear of contradiction that the position the docks of London now find themselves in has been brought about by the insane competition which existed between themselves for many years; in fact, the West India Docks brought themselves to absolute ruin. The competition of the wharfingers took a very small part in their troubles. The wharves were established years before the docks, and have been managed by practical men, whereas the dock companies have been in the hands of boards of directors, who could not possibly have the same practical knowledge of, or personal interest in, the business. I may say that personally I have a very large experience in both the loading and discharging of vessels. In fact, I have done it myself. I have had practical knowledge of it, and at the present time we discharge ships—they certainly are not so large as those in the docks, but the system of doing it is to all intents and purposes the same. We have miscellaneous cargoes which have to be sorted and delivered to the different consignees' barges. Some go to wharves; some go to warehouses; and others go to all sorts of different places; and we distribute the goods in exactly the same way as the dock companies do. There is not the slightest doubt in my mind that the cheapest and the best and the only way is for a ship to come alongside the quay and discharge her goods; and you want places like the "A" jetty at Tilbury Docks, so that the goods may be at once sorted and passed into barges or railway trucks. We do it ourselves. You will see on that photograph jetties running out into the river. The ships lie alongside, the barges are in between, and as we land the goods on to the quay, a man has a list of the different marks. They are all put upon trucks, and they are run round to the barges, and delivered with great despatch, and it does not require such an immense space outside the shed. I am certain that if you have practical men from the dock companies, who have to do this work, they will bear out every word that I have said about it. I have heard some of the evidence here, and I agree entirely with some of it. As to the Albert Docks, where there is a large ship discharging, there is no berth for the barge to load at until the ship is discharged; she may poke her head in, but she cannot get to do very much until the ship is discharged. Then another ship comes alongside, and there you have to wait again for your goods.

2898. You make a suggestion that the docks should be placed under the control of one authority?—Certainly.

2899. Have you got any more detailed scheme in your mind as to the constitution of that authority?—Well, it is really a very difficult thing. It would require very expert opinion as to how it was to be done. In my opinion there is no doubt that if the water of the docks could be under one authority, leaving the dock company their warehouses, and they to become warehouse keepers, and, of course, paying them a proper sum for the money they have expended in making the docks, that would relieve you of a great deal of trouble. It has been said that now the dock companies must consult their shareholders, and therefore they cannot take ships into the docks and work them for nothing. Of course, that is out of the question.

2900. Therefore you suggest the separation of the shipping business and the warehousing business?—I suggest the separation of them if it were possible. I do not say it is possible.

2901. Do you think it is practicable?—I think it is—I think it might be practicable.

2902. Do you think it is expedient?—Certainly, I am sure it is expedient.

2903. And practicable?—I think it might be practicable. That is a matter for consultation with the dock companies. If a Committee could meet with the dock companies and go into the question with them, I have no doubt the dock companies would fall in with the suggested scheme. It would be as much to their interest as to the interest of the general public. The dock companies, so far as I have had to deal with them, are most anxious to show every facility for the discharge of goods, and the system of carrying on the work of the port.

Mr. J. A.  
Humphery.

4 Dec. 1900.

Mr. J. A.  
Humphery.

4 Dec. 1900.

2904. Warehouses now have the advantage of accommodation, do they not?—At the docks?

2905. They have the advantage of wharf accommodation, I mean?—Yes, a great many up-town warehouses, and the warehouses at the smaller docks, like St. Katharine Docks and the London Docks, which would have to be fed from the lower docks.

2906. I am referring to wharf accommodation?—They must have the water accommodation the same as the present. For instance, I presume a ship discharging at Tilbury would bring her goods up to St. Katharine's, and the dock company would have to come up alongside to get their goods out just as they have now. The water would be as free to them as to other people who want it. There is another point that I have not heard anybody deal with yet. It is a point that has apparently been missed here altogether, and that is about transhipment. If you are going to tax barges, that would throttle the transhipment trade of the Port of London effectually. That is a point which does not appear to have been touched upon at all. We do a large transhipment trade to Continental steamers. There is Nestlé's milk; we do thousands and thousands of cases of milk coming from the Continent in our barges, and take them to export ships in the dock. They would not send their milk to be transhipped—they would most likely send it to Antwerp or somewhere else. They would not pay a rate for that. And the same with export stuff going to Continental steamers coming out of the dock. I quite see that you must not have the barges drifting about all over the place, but if the dock companies would allow some of the larger masters to have a small tug in the dock—paying for the privilege if you like—that would in a great measure obviate a great deal of the congestion and trouble that now goes on. It is true that they have tugs of their own in there, for which we pay if we want their services. But it frequently happens that the dock tugs are engaged on their own business, and then, of course, they will not do our work. We have tried to get this facility, but even the gentleman who does the dock company's work himself, Mr. Gray, has not got that privilege. I think if the dock officials were asked, they would bear out what I say. If it were possible to allow some of the bigger masters to have a tug in the dock, to move the craft about, it would avoid a good deal of the barges getting into the way of the ships coming in and out of the docks. I think you will have evidence on this point. I am only what they call a woodmonger, but the lightermen proper will have something to say about that when they come here.

See 3894.

2907. (Sir John Wolfe-Barry.) From your knowledge of the craft on the river, do you think any difficulty would be experienced if the monopoly of the Watermen's Company was broken up?—None whatever, for this simple reason: since this strike has been going on—and this is the seventh week—I have moved I should think—I could not say for a certainty, but I should think, 20,000 tons of stuff.

2908. In lighters?—In lighters.

2909. By employing freemen?—By employing yachtmen, and my son is a lighterman. I apprenticed him to the trade. I have no doubt you will have that brought up before you presently by some of the lightermen, who will speak the other way. They will make out there is a lot of danger attached to it, and all the rest of it.

2910. I only want your opinion?—I have only one son, and it is not likely that I should have apprenticed him to a lighterman, if I thought he was going to run the risk of being drowned or having his legs broken. I have no doubt all this will be brought before you, because they have said it to me over and over again. Absolutely, with clerks out of the office and "handy men" off the wharf, I have been navigating these barges about the River Thames ever since this strike began. If I had the power to say to 50 or 60 men: "If you will come into my service I will give you permanent employ at £3 a week to go into my barges and sit behind the tugs and smoke your pipe," I could have any number of men. But the difficulty I am in is this: the moment these lightermen say they will come back, I am obliged to say to my men whom I have brought from the out-ports: "I am very sorry, but I cannot employ you any longer."

2911. As a practical man, you say that the traffic of the river would be just as well conducted if the monopoly of the Watermen's Company were done away with?—Every bit. I go further and say that it is a most monstrous thing. I may work in the City of London between 200 and 300 cart-horses—valuable horses—nobody has any control over any of my men—I employ whom I like—and if they do damage, I have to pay for it. Then

on the other hand take the barge work on the river. Suppose a ship coming down the river in charge of a pilot runs over my barge; the stuff on my barge may be worth £20,000. But what happens? I am introduced to a gentleman on the bridge, and he is supposed to have got only £100, and all I can get out of him is that £100. Whereas, suppose that in throwing off my barge for one of the different wharves that I work for, I knock a hole in a ship and sink it, they will come and take everything I have got—they will make a bankrupt of me if I cannot pay the whole damage. And also I am obliged to employ a compulsory man. That is where the hardship comes in. I would not mind if I could employ whom I liked.

2912. You would not mind the liability if you could employ whom you liked?—Just so, and I will undertake to say that every master lighterman who comes here will tell you the same thing.

2913. Then you think the work would be better conducted if the watermen's monopoly were broken up?—I do distinctly. There are a certain number of real good lightermen—no better men in London, or in England—but it is only a limited number. When you have done with that number of men you are obliged to go to what we call wasters—any chap who may happen to be at the waterside—you are obliged to take him, because you cannot navigate your barges, unless you have a man in charge of each barge.

2914. You mean a man who is free of the Company?—Free of the Company. There is another point which I have not mentioned, and that is this. A ship is liable only for the amount of £8 a ton, and £15 a ton in case of loss of life. I am liable for everything.

2915. That is rather another question, is it not?—It is another question, but still it shows the unfairness to the poor wretched lighterman, who has to navigate his barge on the Thames.

2916. It is rather another point?—It is another point.

2917. Then I was going to ask you another question. You said that the West India Dock Company brought themselves to almost absolute ruin by insane competition. Is it not the fact that the commercial pressure which fell on the West India Dock Company was in consequence of building Tilbury Dock before the time had come for it?—I knew Mr. Dolree very well indeed; he was Chairman of the West India Dock Company; he used to live near me at Weybridge. Before the Tilbury Dock was built, when it was in contemplation, I said to him, "Why on earth do you not amalgamate or come to some terms with the other docks before you rush into this huge expense?" He said, "How can I? Look at their capital." Of course, I told him what would happen, and it has happened.

2918. But was not the idea of the Tilbury Dock to provide for deep draught ships without their going so far up the river?—Not at all. At that time it was simply one dock fighting against the other. They said they would go one better. That is the real truth. I am sure the directors of the London and St. Katharine Dock Company would bear me out when I say that there was no question about facilities for ships, there were plenty of facilities in those days for the ships using the port, but the West India Dock Company wanted to beat the London Dock Company. I remember quite well, as a young man, I used to go and get ships for my own little docks. I would go to get ships at Gravesend, and they would say, "I will give you a fiver if you come to us." Then the London Docks would go one better and say, "I will give you £10." Then the West India Dock company would say, "I will make it £15."

2919. (Lord Revelstoke.) This statement about the Tilbury Docks, of course, is a statement of your own. You only make it from your own point of view?—I have a very strong opinion.

2920. But it is rather an arbitrary statement, I think?—I think if you were to ask the directors—

2921. I am asking you?—My opinion is, and I have very good reason for saying so, that this was simply the case of the companies cutting one against another.

2922. That is, of course, a statement which is very interesting to hear, and for which we are obliged to you, but it is only your opinion?—It is only my opinion, but I think the directors of the other docks would bear out my observation.

2923. (Sir John Wolfe-Barry.) At any rate, the expense of the Tilbury Dock has been a good thing for

London?—I consider the Tilbury Dock is the best managed dock in London, and the most convenient, and as a matter of fact, I have never charged a shilling extra for coming up from Tilbury. Other lightermen have made a charge.

2924. That is rather contrary to the evidence that we have had?—I know. When the Tilbury Dock first opened some people were charging 4s. a ton. We never charged more than the usual rates from the other docks. We got better despatch and everything—the dock was better managed. Tilbury is an excellent dock.

2925. (*Mr. Ellis.*) Do you think that the difficulties and disadvantages of the Port and docks of London are increasing?—I think they will increase with the size of ships that come in now.

2926. Do you think the difficulties and disadvantages are increasing?—Yes, I do.

2927. And that the position is getting more serious?—Yes, with the size of ships that come in.

2928. And therefore something should be done without delay?—Certainly. I think certainly the large shipowners would say so.

2929. I am not asking you about the large shipowners. I am asking you with your great experience to give us your views. You have come before us as a witness to speak that which you know. I may take it from you that you think something should be done without delay?—I do, in order to increase the facilities of the Port of London. A great deal has been said by these shipowners, I know (and I have been told myself) about the despatch. Well, there is no doubt about it. I fearlessly say that if you get any practical men from any of the docks, they will tell you that the only way to give despatch to ships is to turn their whole cargo out on the quay. It is no use fiddling about. You may get a run of stuff put over the ship's side, but you ought to be able to land the whole cargo on the quay, and then ship it to the barges, or railway, or what not.

2930. I think we need not go into details. You say generally that something should immediately be done to improve the facilities of the Port of London?—Certainly.

2931. (*Rear-Admiral Hext.*) You are in favour of

doing away entirely with the privileges of the Watermen's Company?—I am, certainly; most distinctly.

2932. (*Sir Robert Giffen.*) You have ships drawing 17ft. of water coming into your private dock?—Yes. I have had two China clippers, in years gone by, at the same time in that dock—vessels of 600 and 500 tons.

2933. Do any of them come into the dock?—Right into the dock in the old clipper days.

2934. Is that water free?—Yes, perfectly free, and we charge no dock dues either.

2935. A barge has a right to come in just as they do into the other docks?—Certainly, and ballast barges and barges bringing goods for the ships, if they load in there, we charge them nothing.

2936. But that is not a matter of legal obligation; you can charge what you like?—It is a private place. If we chose we could charge them anything, or prevent them coming in.

2937. Then with regard to the formation of a Trust and the separation of the warehouse business from the dock business proper, have you considered the case of the warehouses actually overhanging the dock water—how they could be separated?—Well, there is a difficulty which would have to be discussed with the dock companies and gone into with their experts to see if anything could possibly be done. I only say that I think if the water could be dealt with by another authority, and the warehouses left with the dock company, if that is possible, it would be a very great thing not only for the public generally, but also for the dock companies themselves. I think the water is an incubus to them.

2938. Are there any other difficulties of that kind that would impede the separation of the businesses?—Well, the dock companies would be the better judges to say what the difficulties would be.

2939. If they tell us that the two things cannot be separated, or that it would be a work of extreme difficulty, are we to accept what they say?—Well, I was very much surprised to hear some remarks that were made by Sir Thomas Sutherland—I read his evidence. He talked about putting his valuable ships in the river. I do not think he could ever remember the time when we had the ice in the river. I have seen a ship's hawser as big as your leg break with the weight of ice on them.

Mr. EDWARD WEBER called and examined.

2940. (*Lord Revelstoke.*) Mr. Weber, you do not represent the Wharfingers' Association. You are going to give evidence on your own account?—Yes; I am an independent witness.

2941. Would you kindly give us your evidence?—I have been since 1877 a member of the firm of Anderson, Weber, and Smith, wharfingers, now occupying Metropolitan and New Cranes Wharves, Wapping Wall, and Cold Air Stores, Montague Close, London Bridge. The firm's premises are mostly bonded, and some 40,000 to 50,000 tons of goods are landed annually, consisting of coffee, cocoa, general East and West Indian and colonial produce, and frozen meat, etc. I agree with the evidence given by the chairman of the Wharfingers' Association. I consider the total warehouse accommodation of London ample for present requirements. I consider that one great defect in the administration of the port is the delay often experienced in getting goods from vessels discharging in the docks, I think in great measure owing to want of sufficient facilities for landing from ships and sorting and delivering to barges simultaneously. I also consider that the monopoly of the Freemen of the river as to navigating barges is detrimental to the interest of the port. I am of opinion that it would be to the advantage of all who use the Port of London if one central authority were established, having authority over the whole river, its maintenance, improvement, and navigation, and also of the dock companies' present waters, locks, and quays, but not the warehouses. That this central authority should be charged to provide the necessary appliances for expediting all discharging and loading operations, and have general control of them, and that the costs of these, the dredging, etc., of the river, and all the other duties, should be provided mainly by:—(1) A tonnage rate on all vessels entering the river to discharge or load cargo; (2) a further rate on all vessels entering the docks to discharge or load their cargo themselves; (3) or rates for rapidly discharging the cargoes across

the quay and delivering it to consignees, paid, of course, by the ship as at present—that is the idea; (4) other charges hitherto received by the Thames Conservancy and Watermen's Hall, and (5) if the above are insufficient, a small tonnage rate on all goods imported.

2942. (*Sir John Wolfe-Barry.*) You complain of want of facilities; but when it is interpreted, does that mean more quay space and more access for lighters to the quays?—More quay space.

2943. And better access for the lighters to the quays?—Yes.

2944. (*Mr. Ellis.*) Under your five heads, you contemplate the imposition of certain rates and charges. Those would all fall upon the goods eventually, would they not?—Eventually everything falls on the goods.

2945. That is what I mean. You do not contemplate anything beyond these? You think these would be amply sufficient for your central authority?—I think they would be sufficient; but doubtless, if a large amount were required to be borrowed by the central authority, there would have to be some guarantee behind it, in order to borrow at a good rate of interest.

2946. Can you indicate what that would be?—I should think the rating would cover it.

2947. You would fall back on the rating?—On the rating; but you cannot imagine that the trade of London is going to fall to such an extent that these would not be sufficient.

2948. But the consumer eventually must pay?—He must eventually pay, whatever is done. The great point I have in my mind is always free access, free water, and free delivery, as at present.

2949. Do you think the imposition of these charges, falling as they would where you have indicated, would place London at any disadvantage with other ports?—I do not think so.

Mr. J. A. Humphery.  
4 Dec. 1900.

Mr. E. Weber.

Mr. E.  
Weber

4 Dec. 1900.

2950. You have contemplated that, of course?—The idea is to give facilities which would bring the trade here.

2951. You think the money would be so spent that the extra facilities would amply recoup those charges?—I do.

2952. (*Rear-Admiral Hext.*) You advocate one central authority over the whole river, including the dock

company's present waters, locks and quays. By "quays" do you refer to the wharves on the Thames not belonging to the dock companies?—I had not contemplated that at the time, but I suppose that would have to be so if it were made.

2953. You said, "The dock company's present waters, locks and quays." I want to know whether "quays" apply to all the quays on the river, or only to the dock companies' quays?—The dock companies' quays.

Mr. M. B. F.  
Major.

Mr. MARK BUONVENTURA FEATHERSTONEHAUGH MAJOR called and examined.

2954. (*Lord Revelstoke.*) Will you be good enough to proceed with your evidence?—I am a partner in the firm of Major and Field, which was founded by my father, Mr. Charles Messenger Major, in conjunction with others, in December, 1853, under the style of Kearns, Tuxford and Major. We carry on business at Red Lion and Three Cranes Wharf. We are wharfingers and bonded and general warehousekeepers, and do our own and a small general lighterage business and a large frozen meat lighterage trade. Our premises are situated on the north side of the river, and adjoin the east side of Southwark Bridge. In 1864 we started the husking of coffee in London, as it appeared that there was a growing desire on the part of planters to ship their coffee in the parchment, and facilities for the treatment of such coffee were already being offered on the Continent. The business has now become a considerable one in the port. I am of opinion that a master lighterman's liability for damage to cargo carried by himself, and for damage caused to other vessels and cargo, should be limited in the same manner as a shipowner's liability. At present the liability is only limited by the extent of the damage, and the risk as regards damage caused to other vessels and their cargo, is of necessity an absolutely undefined one in extent. Master lightermen, by adopting the London Lighterage Clause, can free themselves from liability for loss or damage to cargo they may carry, but, although merchants' policies can be taken out to cover the goods until finally landed, and without recourse to lightermen, their consent to the adopting of this clause cannot always be obtained. In such cases a master lighterman has either to run an undue risk, or to take out a policy to cover it, the premium on which is very heavy, thus adding indirectly to the cost of lighterage, by necessitating two policies where one would suffice. I submit this as an instance of the way in which the requirements of London merchants tend to increase charges unnecessarily. My point is that the tendency of the conditions under which a master lighterman has to conduct his business is towards increasing his risks, and therefore increasing the charges he has to make unduly. I put in tables showing the average time occupied in obtaining delivery of the same class of cargo for our wharf, from vessels discharging in the various docks, and also, in the case of coffee, at Southampton.

*(The Witness handed in a table showing the average time occupied in obtaining deliveries of cargoes of coffee and tea for the wharf of Messrs. Major and Field from vessels discharging in the various docks, and, in the case of coffee, at Southampton. See Appendix, 8th Day, No. 6.)*

I may mention that this only refers to obtaining the bulk of the cargo. There are a certain number of packages that we cannot always obtain immediately from the ship. I have not taken that into account, but I do not think it makes a material difference in the point of view I am considering, because very often, for our own purposes, we should not take delivery of the last portion immediately. We should keep it down in the dock until we had received another parcel of goods. I draw the following conclusions. As regards coffee, that London does not compare unfavourably with Southampton in this class of cargo, which is, I think, the only class permitting of fair comparison. One line, the Royal Mail Company, send their mail boats to Southampton and their cargo boats to London, and I find that we are not at any disadvantage in taking delivery of our cargo in the Albert Docks. I have omitted small parcels. I have taken large parcels, and I find that the result is not unsatisfactory at all from our point of view. I do not know whether the difference that I make as against others who have given evidence to-day, is partly due to the fact that we have not taken into account what I should call the "completion" of the cargo. But the fact remains that I think the result in London is very

satisfactory as regards coffee from the Royal Mail steamers.

2955. Where does the Atlantic transport trade come from?—It is transhipped at New York for London.

2956. As far as you are concerned, it comes from New York?—Yes; and there again we find the same, although the Atlantic Transport line brings a very miscellaneous cargo. It does not mean because we get the coffee in this average number of days that the cargo is all discharged; but as regards coffee we find that there is no disadvantage in its coming that way. Then my second conclusion is that, other things being equal, it would seem to be in merchants' interests that cargo vessels of a moderate, rather than of a very large size, should be employed, unless shipowners can increase the rate of discharge proportionately to the increased size of the cargoes. We notice that with the boats which discharge in the London Dock bringing coffee from Natal, and the boats discharging in the river and the St. Katharine Dock. We have only one discharging in the river which brought us a consignment comparing with two in St. Katharine Dock, and that one seems to point to the fact that cargoes from small vessels can be satisfactorily delivered overside into barges. They only took two days from the time they reported the ship to the time the coffee was at our wharf, which we thought not at all unsatisfactory. As regards tea, the return seems to confirm the widely-held view that the jetty system of the Victoria Docks is better than the quay system. I am not prepared to say, however, that this can be accepted as absolutely conclusive, as, although the jetty system is no doubt the better of the two, if vessels are only berthed on one side of the jetty, leaving the other side free for barges, I do not think that in actual working this would be done as a general rule, and the advantage in that case would be very materially reduced, so that in providing for fresh dock accommodation, considerations such as cost and convenience for other reasons, could probably be allowed their full weight without great detriment to the result. The comparison there is the "City" boats, which are about the only line of boats which discharge tea in the Victoria Docks as against the P. & O. steamers, and John Swire and Co.'s. Those steamers have very varied cargoes, which would take relatively longer to discharge. The boats in the Tilbury Docks also bring chiefly tea. I am further of opinion that by the more frequent use of a "dummy" between the vessels and the quay, delivery of the cargo could often be accelerated under the quay system, but I anticipate that modern luffing cranes would be necessary in order to plumb over the intervening space on to the vessel's deck, landing the cargo in the sheds, deliveries at the same time being made from the sheds to barges on either side of the "dummy" between the vessel and the quay. I consider that shipowners should endeavour to acquaint themselves with the plan of stowage of the vessel, so that craft need not be sent for goods, as now, on the arrival of the vessel, but only when the shipowners notified that they were ready for delivery. I am aware that that is very often not feasible, but to a considerable extent I should fancy that shipowners might do more to enable themselves to advise merchants and lightermen where the goods are stowed, and when they are ready for delivery alongside. That would be a great convenience for merchants and lightermen, and at the same time it would tend to avoid congestion of the docks by the barge traffic. Increased facilities for locking barges in and out of dock are required, and proper control should be exercised over them when entering and leaving the locks, as the almost entire absence of such control at present at the locks of the Albert Docks results in great confusion and serious delay. It is a matter for consideration whether it would not be practicable to make the lock levels by pumping water from the river into the locks. If this could be done, it seems probable that much less dredging would be required in the docks, and that barges

could be locked in and out at all states of the tide, which would be a great facility to the commerce of the port, and would tend to counteract the ever-increasing cost of lighterage. I do not know whether, from an engineering point of view, that would be feasible, but if so it would be a very great advantage to us. I am strongly of opinion that the questions of the water approaches to the port, and of dock accommodation and facilities, are questions of the greatest importance and urgency to the entire population of London, and to some extent also to the Empire. I believe and I think it is generally admitted that the physical conditions of the port in these respects are in serious danger of falling behind the requirements of modern times, even if they have not already done so, and this being so, immediate steps should be taken that will enable the port arrangements to be kept abreast of those requirements. I am opposed to any alteration of the system under which free delivery of goods and free access of barges to vessels, whether berthed in a dock or in the river, can be claimed under certain conditions, as I believe such alteration could not fail to be unjust and inequitable to the large interests which have grown up on the faith of repeated Acts of Parliament confirming this system. If I may, I should like to say here a few words with regard to the tonnage carried by barges, as having a bearing on the suggestions that have been made that dues should be levied on barges. This comes in better at this point.

2957. Are you now coming to your return of the tonnage of barges?—Yes, the measurement tonnage of barges, the burden tonnage of barges, and the actual weight of goods that barges brought up per ton.

2958. I think that encroaches on the case of the dock companies, and I do not think we can allow that to be put in for that reason?—Not at all.

2959. Not at present?—It is an important return, of course, as showing what our barges actually carried.

2960. Yes. We can deal with it later, perhaps?—If, however, it should be found impossible to obtain further revenue in any other way, any charge should, I consider, be made on all goods irrespective of destination or mode of delivery. If feasible, it might be found desirable to exempt transhipment goods from such a charge, but there would be difficulties in arranging this. At the same time, I am very strongly opposed to any additional charge whatever being placed on goods if it can possibly be avoided, as any charge could not fail to handicap London trade to some extent. Up to the present time much trade has probably come to London owing to financial considerations, in spite, possibly, of higher charges, but as foreign money markets gradually develop in importance, this cause will, it is reasonable to assume, gradually cease to operate with the same force as in the past, making the question of relative charges one of still more vital importance in the future. I do not consider that dock management and the provision of dock accommodation for the Port of London is a suitable matter to be left to a trading company for the following among other reasons:—(a) That the interests of London as a whole may often demand the outlay of large sums for purposes that may not be remunerative for many years, or that in themselves may never be so, and it would be unreasonable to expect such a company to provide for them, contrary to the interests of its shareholders. (b) That in the interests of London as a whole it may be advisable to levy charges on a basis which would not provide adequate remuneration for shareholders in a trading concern. (c) That if it should ever be necessary to abolish the right of "free delivery" and sanction the levy of an equal charge on all goods, irrespective of destination, by the dock companies, there would be great danger that in the stress of competition for the warehousing of goods they would directly or indirectly remit such charge on goods warehoused with them. In such case the port would have lost the benefits appertaining to the system of "free delivery," and would not derive a correspondingly full benefit in exchange. At the same time, competing interests would be seriously prejudiced. Bearing on that, I should like to point out that the Messageries Maritimes de France on their line have a clause which provides that the expenses of discharging from the steamer and manipulating are to be borne by the goods at a certain rate. The consignee, when he presents his bill of lading at the shipowners' office for a release, is asked whether he wishes for a dock release or an overside release. If he asks for a dock release he is charged at the rate of 2s. a ton, discharging expenses. If he asks for an overside release he is charged 3s. 6d. a ton. I, of course, do not know exactly what the relations between the dock company and the shipowner are, but I think it is reasonable to suppose that

the shipowner will not receive less than 3s. 6d. a ton from somebody. He puts that down as being the cost of discharging, and either the dock company have to do the work of discharging and delivering the cargo to barges from their own docks, or otherwise take the delivery from the quay, or they make an allowance to the shipowner to cover that. It seems to be revenue which is given up, when really it might just as well have been retained.

2961. It is not a matter of your own knowledge, is it?—It is a matter of my own knowledge that the consignee is charged 2s. if he leaves the goods in the dock, and he is charged 3s. 6d. if he takes them overside. The business of warehousing on the other hand can be suitably conducted by such a concern, and I therefore advocate that, if possible, the dock waterways, quays, etc., should be taken over by a public Trust, and that the existing Companies should retain the warehouses in their own hands. If the Trust were to take over the warehouses it would almost certainly be necessary to compensate competing interests, or for the Trust to take them over as well, neither of which plans would, in my opinion, be to the best interests of the Port. Revenue should be obtained by dock dues on shipping, charges for quay space, etc., much as at present, but, in my opinion, a Port Trust should not undertake to supply the labour for the discharging of ships, as I believe this could be more efficiently supervised and controlled by shipowners themselves than by a concern of such magnitude as a Trust would be. In my opinion, everything possible should be done to encourage delivery to barges, which is quicker and cheaper than delivery to vans, and has the effect of keeping the traffic to London's natural highway—the river, instead of adding to the congestion of the street traffic. Should the charges received from shipping, etc., not prove adequate to provide for the interest on capital, it is a question for serious consideration, whether, as the prosperity of London as a City is bound up with the prosperity of the Port, the deficiency would not be more advantageously made up by levying a rate on all property than by placing charges on goods or unduly heavy charges on shipping. In such a case a rateable value might perhaps be placed on all craft not liable to dock dues, for the purpose of charging the rate on them also. The cost of maintaining the river approaches to the Port, and of keeping them always abreast of requirements, ought, undoubtedly, to fall on the rates, seeing that they constitute the highway to the City from all parts of the world. It would appear to be desirable that the control of the river and of the docks should be in the hands of a single authority, the members of which should be elected by the various bodies interested in the traffic, and I should say by the representatives of the ratepayers also if contributions are made from the rates. I think if the Port had been under some such control in the past we probably should not have had Tilbury Docks at present. We should have had docks nearer those which are already existing, probably additional dock accommodation at the Albert and Victoria Docks, which would have been of great advantage from the consignees' point of view. There may have been some advantage in having the dock at Tilbury, for certain traffic has been attracted that wanted to discharge a small portion of traffic, and then go elsewhere. But I doubt whether the Port, as a whole, has benefited by Tilbury Dock. It would have been better if we could have had a dock nearer other docks. Speaking for our own firm as lightermen, as well as wharfingers, the effect has been that we do not find that we could advantageously do our own lightering from Tilbury Dock. We have handed it over to an ordinary master lighterman to do it for us, because the amount of traffic that we could obtain was not sufficient for us to get a fresh staff to do that work. Also the towing charges operate very adversely to doing the work from Tilbury. The charge is about 50 per cent. more than the charge for towing from the Albert Dock, and it is about 100 per cent. more than from the Victoria Dock.

2962. (Sir John Wolfe-Barry.) I think I gather from you that you would have liked to see Tilbury Dock nearer London?—Exactly so.

2963. But assuming that it is necessary for ships to have deep water to enter docks you could not have had the advantage of the Tilbury Dock without deepening the river?—That undoubtedly should have been done. I think if it is possible to do that it should have been done.

2964. Therefore, if there had been a central authority in former times to deal with the question, you think Tilbury Docks need not have been built at Tilbury, but

Mr. M. B. F.  
Major.  
4 Dec. 1900

Mr. M. B. F. higher up the river, the river being supposed, under the arrangement, to be deepened for big ships?—Exactly.

Major.

4 Dec. 1900.

2965. Your proposal with regard to the dock companies and the Trust, if one is formed, I gather, would be that the warehouses belonging to the dock company would be left to be managed as a warehouse company by the docks company?—Yes.

2966. And I gather also that you would not be afraid of such a competition as that?—I do not think so. They would have to retain their warehouses at a fair valuation, I suppose, and I should fancy that that valuation would be such that they could not undercut me unduly—I do not think so. I hope not.

2967. At any rate, that would be such a fair competition that you do not think people ought to be afraid of. It would be a large warehousing company?—Undoubtedly it would; but it is now a large warehousing company.

2968. But now the warehouses are affiliated to a dock company?—I quite see that it may be handicapped by its docks, but I fancy that that is a competition that we should be able to stand.

2969. Supposing the two were separated, although it would be a very large warehousing interest you think that it would not be too large for fair competition with the other warehouses?—The fact of its size would be rather, I am inclined to think, a detriment to the warehousing company itself than to ourselves as wharfingers.

2970. That idea is based upon the primary condition, is it not, that the docks, and the quays round the docks, were under a public Trust?—Yes.

2971. So that the various warehouse proprietors in London, and the new warehouse company formed from the dock company, would be both on equal terms so far as the use of the docks and the quays is concerned?—Yes.

2972. Therefore, you would suggest that a very adequate amount of quay space should, at any rate, be left to the Trust?—The Trust, I think, would have to take over the whole of the quay space.

2973. It is not merely a question of the water, but of all the necessary quays for the discharge of ships rapidly, so as to avoid demurrage?—Yes.

2974. From which quays the goods would be distributed either to the private warehouses or to the warehouses belonging to the original dock company, on equal terms?—Exactly. The shipowners, of course, would want the same facilities as they have at present. Therefore the quay space could not be curtailed.

2975. On the contrary, I suppose that if rapid discharge is a necessity for the ships, the larger the quay space the better for the shipowner?—No doubt.

2976. And I gather from what you say, that unless some proposal of that sort is made, you see no alternative but to buy up all the competing interests?—That is so. I do not think it would be reasonable to put the warehouses into a public Trust, to compete with private interests. If the warehouses were taken over by the public Trust, then I think there would be claims for compensation from private warehouse keepers.

2977. You mean that if the warehouses and the docks and the quays were under a public Trust the competition would be too severe for private interests?—Undoubtedly, I think.

2978. That would be competition engendered by the Trust?—Yes.

2979. And in that event you see no safeguard short of buying up those private interests, as has been suggested this morning?—I do not.

2980. Then you said something about rating of the barges. Such a thing has never been heard of in this country as rating movable things, has it?—I should think not; but I should think it would be feasible under the authority which at present grants us our licences for the barges. Some such system could be made, by which we should pay the equivalent amount

of rate on the barge, I should fancy. We have to get a certificate for every barge we have on the river now.

2981. Perhaps it would be more in accordance with the ordinary practice in this country to call it a licence, or something of that sort, because rateable value is invariably something which cannot be removed from the ground?—The term might be altered undoubtedly, but the effect, in my idea, was that the property should pay the same as, for instance, my warehouse property has to pay. I pay so much in the £ for my warehouse property, and therefore I should pay so much in the £ for my barge property.

2982. But it is a very different thing rating a barge which may be here to-day and gone to-morrow, and rating your warehouse, which cannot get away?—Undoubtedly; but if I lose one barge to-day, I shall probably replace it by another to-morrow.

2983. That may be so, but it does not follow?—No.

2984. (Mr. Ellis.) What you want is the money. You do not care whether it is a licence or a rate; but you want the money?—Money will no doubt have to be obtained, and if it has to be obtained from the rates it occurred to me that it might be reasonable that the floating property should be charged as well.

2985. In your statement you said that you were strongly opposed to any additional charge whatever being placed on goods. You have heard the evidence of some of the previous witnesses, no doubt?—I have.

2986. Do you differ from them in thinking an additional charge might be detrimental to the Port of London?—I feel that an additional charge on those goods which are not consumed in London itself must operate against the Port to the extent of the charge.

2987. And, I suppose, from what you have said, that you would desire this public Trust, supposing it were set up, to bear in mind that the trade of London must not be injured by any imposition of undue charges, and go to the rates rather than do that?—Undoubtedly.

2988. To that extent you would put the rates almost in priority. You would put them, at all events, prior to undue charges?—Prior to undue charges, of course. Those interests which already bear a charge and are not shown to be affected by that charge could fairly continue to bear that charge; but when it comes to be a question of imposing a new charge, an additional charge, the effect of that is uncertain. Therefore, the authority should be very cautious in imposing additional charges.

2989. Do you think that a public authority of that kind, if it had the open mouth of the rateable purse ever at hand, might become extravagant? Do you think it might show want of economy in its operations?—If it was a thoroughly practical body, with the trading community largely represented on the body, I do not think there would be any danger of that, because a trader would, after all, feel that, if he was wasting the money, he was imposing an additional burden upon himself. For instance, the warehousing interest would feel that very keenly. If an addition had to be made to the rates, they would know it at once.

2990. At all events, you think that the burden of the rates would be sufficient security?—I should fancy so.

2991. You have given some thought to this, perhaps, have you, as a ratepayer?—Yes.

2992. As a member of a firm which pays large rates?—Yes.

2993. And you would be perfectly willing to take the risk yourselves—I put it to you—of creating a public Trust which might conceivably increase the burden of rates considerably?—Undoubtedly, if it was an elective body which would feel the imposition of the rates directly. The constitution of that body would no doubt want very carefully considering, and it would want to be guarded against very carefully, so that one interest should not have priority over another.

2994. But coming before us as a member of a firm of large ratepayers, you yourself are willing to run the risk?—Yes.

(Adjourned to Tuesday, the 11th inst., at 12 o'clock.)

# ROYAL COMMISSION ON THE PORT OF LONDON.

## NINTH DAY.

*Tuesday, 11th December, 1900.*

### PRESENT :

The Right Hon. LORD REVELSTOKE (in the Chair).

Sir ROBERT GIFFEN, K.C.B., LL.D.

Sir JOHN WOLFE WOLFE-BARRY, K.C.B., LL.D., F.R.S.

Rear-Admiral Sir JOHN HEXT, K.C.I.E.

JOHN EDWARD ELLIS, Esq., M.P.

CECIL OWEN, Esq., *Secretary.*

Sir ALEXANDER RICHARDSON BINNIE called and examined.

2995. (*Lord Revelstoke.*) You are the chief engineer of the London County Council?—Yes.

2996. And you have been in that position since March, 1890?—Yes.

2997. You are a Member of the Council of the Institution of Civil Engineers and a Fellow of the Geological and other societies?—Yes.

2998. You appeared and gave evidence before the Lower Thames Navigation Commission in 1894?—Yes, I did.

2999. Will you kindly give us your evidence?—I will first deal with the question of main drainage. The County Council and its predecessors, the Metropolitan Board of Works, have devoted much attention and expended considerable sums in improving the purity of the river by preventing the entrance of solid matter, due either to house drainage or the washing of the streets. Since 1855 up to the present time they have expended a capital sum of over £8,000,000 on the main drainage of London. Since 1889 they have expended in capital over £1,000,000 at Barking and Crossness (including the provision for ships) for the purpose of clarifying the sewage by chemical precipitation, the annual cost of working which system is over £100,000. The results have more than fulfilled the best anticipations of those who designed the works. The process may be described as adding to the crude sewage from four to five grains of lime and one grain of proto-sulphate of iron per gallon, and allowing the sewage so treated to deposit its grosser suspended matter in large covered tanks. The supernatant effluent is passed into the river, so far as suspended solids are concerned, in a comparatively clear state. The crude sewage as it flows to the outfalls contains about 30 to 35 grains per gallon. About 80 per cent. of this solid matter is removed by the above process. The matter deposited after the above treatment with chemicals, and which is technically termed "sludge," is a black offensive semi-fluid containing about 90 per cent. of moisture. This matter principally consists of flocculent particles containing but little solid mineral matter. The sludge is at the outfalls (Barking and Crossness) pumped into ships, sent 40 or 50 miles down the river, and discharged in the Barrow Deep, 15 or 20 miles below the Nore Lightship on the ebb tide. The discharges of sludge are watched and regulated by signal from our ships to the officers of the Trinity Board at the Maplin Lightship, who keep a record of the passage of each ship into the Barrow Deep, and report the same to the Thames Conservancy. To perform this duty a fleet of six vessels of the most modern type is constantly engaged night and day at all times of the year. Each vessel is about 1,800 tons gross and 1,000 tons net capacity, 234 feet long, by 38 feet wide, and 14 feet

6 inches deep. When light the vessels draw 7 feet 6 inches, and when loaded 10 feet to 10 feet 6 inches of water. The average cost of conveying the sludge to sea in the Barrow Deep, a distance of 45 to 50 miles from Barking to Crossness, is £14 3s. 5½d. per trip, including the return journey empty. As each ship carries on an average 1,000 tons, this works out at about 3½ pence per ton per trip, or, taking the journey as 45 miles, at 0·075 pence per ton per mile. If you will allow me I will hand in the annual statement of the cost of working the sludge ships, which you will find on pages 6 and 7 of the annual return. (*The Annual Return was handed in.*) The channel of the Barrow Deep is not used as a general navigable channel, but has been buoyed and partly lighted with gas buoys by the Trinity Board at the expense of the London County Council; and is now used by other bodies for the deposit of refuse material without any payment on account of the buoyage of the channel. I hand in a chart of the channel showing the position of the line marked red, within which we are not allowed to deposit sludge. (*The Chart was handed in.*) With regard to Question 3318, asked me by Sir George Nares, when appearing before the Board of Trade inquiry, 1894-96, I should like to be permitted to make the following remark:—That I do not consider the light flocculent matter of the London sewage is of any permanent injury to the Barrow Deep as a possible future channel at the mouth of the Thames. But it has been given in evidence that the solid matter derived from dredging the river is now being deposited there. I rather incline to the opinion that possible injury to the channel of the Barrow Deep might be obviated, and the dredged material more economically disposed of by forming the same or similar training banks to that mentioned in paragraph 47 of the Board of Trade inquiry report. The whole of this work is carried out by me under the direction of the Main Drainage Committee. With the object of still further preventing the entrance of drainage and other solid matter into the river and the lessening of the discharge of storm overflows, the Council, on 5th December, 1899, determined to carry out, under my advice, a further extension of the main drainage works on both sides of the river. The contract for the first portion of these works has been let, and the works will soon be commenced. The estimated cost of the total scheme amounts to nearly £3,000,000, of which the first instalment of 1½ millions has been sanctioned by the Council. If you will permit me, I will hand in my report upon that. (*The Report was handed in.*) Perhaps it is not pertinent to this inquiry altogether, but I have a table which may prove of interest. I have taken out, as you will see, the increases of population within the County of London since 1851, and if you will permit me, I will read that. From the census of 1851 to the census of 1896, the increase was at the average rate of 45,904 persons per annum. From the census of 1881 to the

Sir A. R.  
Binnie.

11 Dec. 1900

Sir A. R.  
Binnie.  
—  
11 Dec. 1900.  
—

census of 1891 the increase was at the rate of 39,792 persons per annum. Then if we take the Census of 1891 and the Census of 1896 the increase was at the rate of 40,180 persons per annum. Since 1896 the only data I have are the Registrar General's Returns up to the middle of 1900, and from 1896 to the middle of 1900 the population increased apparently at the rate of 44,561 persons per annum. That of course as you are aware is the County of London, but there is a very large population beyond the Valley of the Lea in the County Borough of West Ham. I am not able to give those figures so accurately as the others, but I find from the Census Returns that the County Borough of West Ham increased from 123,953 persons in 1881 to 204,903 persons in 1891; and if we take the whole of the parish of West Ham I find it increased from 200,958 in 1881 to 365,134 in 1891.

(The witness handed in a Table showing the increases of population within the County of London since 1851. See Appendix, 9th day, No. 1.)

3000. (Mr. Ellis.) Have you had any complaint as to the action of your Council with respect to the deposit of sludge?—None whatever.

3001. Not during the whole of your time?—No, not during the whole of my time. An allegation was once made that our sludge ships had on one solitary occasion discharged within the red marked boundary on that plan, but it was ultimately proved to be a mistake, and that it was someone else's vessel.

3002. On this map which you have put in you make the observation "Sludge has not to be discharged west of this red line. See letter from the Secretary of the Trinity House, 6th July, 1887." Are the Trinity House your governing authority as to where the sludge is to be deposited?—It was by agreement with the Trinity House and the late Metropolitan Board of Works that we were permitted to discharge in the Barrow Deep, and it is under their strict regulations that we do so now.

3003. The County Council were not in existence in 1887?—No, they only came into existence in 1889.

3004. Do the Trinity House hold the same relation to the County Council that they did with respect to the Metropolitan Board of Works? That is to say, can they lay down regulations as to where sludge is to be deposited or not?—All I can say is that if they wished to change to anywhere else we should go there. And they regulate our buoys and attend to the lighting of those buoys that are marked as light buoys, at our expense.

3005. They are your superiors?—Yes.

3006. Not the Thames Conservancy?—No. It is outside the Thames Conservancy limits.

3007. Then you go to some expense which is borne of course by the ratepayers of London with respect to this buoying?—Yes. The whole expense of buoying the channel and keeping three of the buoys lighted is borne by the County Council of London.

3008. It strikes one as rather a curious division; the superior authority does not pay for the consequences of the orders that it issues. If the Trinity House ordered you to put the sludge anywhere else, would you have to put new buoys at your own expense?—I imagine that the Trinity Board would quote what has been done in the past as a precedent, and ask us to pay for them.

3009. Then it is by friendly arrangement?—It is by friendly arrangement at present. There is no statutory obligation that I am aware of on the subject whatever.

3010. No questions have arisen as to whether moneys derived from the ratepayers of London can be expended out in the German Ocean?—That question has never been raised.

3011. (Sir John Wolfe-Barry.) Then is the agreement a terminable agreement?—I imagine so. We work in a friendly way with the Trinity Board, and if they suggested some other channel or some other place we should bow to that at once, I think.

3012. I see the red line is not merely drawn across Barrow Deep, but it extends to the other side of West Swin, and it also extends on to the Kentish Flats?—It does.

3013. Is it your opinion that you might deposit sludge anywhere eastward of the red line, or must you deposit it entirely in the Barrow Deep?—Entirely in the Barrow Deep.

3014. Therefore the extension of the line northward and southward has nothing to do with the case. You

could not deposit this material, for example, on the Flats?—Certainly not. The line is drawn in the way you see it on the chart for this reason: it is defined in the letter quoted as:—"A certain line drawn from the Maplin Lightship to the North Knob Buoy." The line is prolonged from the lightship on the north on to the Flats to make it perfectly clear where the line is.

3015. Therefore the line is of distinctly limited length?—Certainly. We are not allowed to discharge outside the Barrow Deep without, of course, it were altered by the Trinity Board themselves.

3016. What is the total quantity of sludge per annum which is sent down by your steamers?—In round figures it is about 2,000,000 tons.

3017. Can you give us any idea as to the relative amount of solids and liquid?—It is about 10 per cent. of solids. About 200,000 tons per annum of solid matter would be deposited there.

3018. Ten per cent. of the total deposit?—Yes; and of that solid matter I think three-fourths is organic and one-fourth is mineral.

3019. You said something about the solid material which is deposited by other persons in Barrow Deep being suitable for making embankments?—Some of the harder of that material I should have thought could be more economically used in carrying out that recommendation which I have quoted. If you recollect, paragraph 47 suggested that a tidal training bank should be formed to the eastward of Canvey Island.

3020. I do not know whether you are going to give us any opinion as to that mode of deepening that portion of the river, or are you going to leave it to others?—I am going to leave that lower part to others.

3021. That solid material which you allude to as being deposited in Barrow Deep by these persons comes, I suppose, from excavations of various kinds on or near the river; or is it road detritus, or what is the source from which the solid substances come?—From dredgings in the river. I think it was given by the Thames Conservancy themselves in evidence before this Commission that their dredgings between Gravesend and Canvey Island are now deposited in Barrow Deep.

3022. And I suppose there are quantities of materials brought from public works of various kinds, are there not?—I think there are.

3023. From excavations for docks, for example?—Possibly so. I cannot say exactly where they get the material from, but I have seen ships depositing the material in the Barrow Deep.

3024. I should not perhaps be wrong if I said that some of the material excavated when forming underground railways or other public works is deposited there should I?—Possibly it is so—I could not say.

3025. I suppose I am right in saying that everything which is not deposited on land adjoining the course of the river would be deposited in Barrow Deep?—At present that is so.

3026. Can you give us any idea of the total quantity that is now annually deposited in Barrow Deep in addition to what the County Council deposit there?—I cannot. I have no means of ascertaining at all.

3027. Could you indicate to us any body of persons who can give us any information on that point?—I could not. Of course, the Conservancy can answer for themselves what they are doing. The other bodies would probably be watched as our ships are watched by the officers of the Trinity Board at the Maplin Lightship.

3028. Then do you think the Trinity Board would be able to give us the information?—Possibly so.

3029. Do they keep records of your ships?—Yes, they keep records of our ships.

3030. But you do not know for certain whether they keep records of other ships?—I do not.

3031. Do you know of any surveys of Barrow Deep made from time to time by the Trinity House?—I do not, further than those mentioned in the Board of Trade Inquiry of 1894.

3032. You do not know of any surveys being made from one year to another as to the effects of depositing in Barrow Deep?—I do not. We make a biennial survey of the Barrow Deep to see if we are in any way polluting the sandbanks of the neighbourhood.

3033. You mean the surface of the sandbanks?—Yes, to see for our own satisfaction that we are ourselves not committing a nuisance, and I am glad to say that they

See 1458

are very favourably reported on by the chemists who make the surveys.

3034. Have the County Council any dredging powers in the River Thames?—None whatever, except when we are rebuilding or building a bridge. There are some dredging powers necessarily combined with the bridges.

3035. (*Lord Revelstoke.*) Now will you give us some information as to the areas of land the levels of which are subject to flood?—There are large areas of land, now more or less built upon, within the County of London and contiguous to the river the levels of which, being below Trinity high-water mark, are subject to flooding. I will hand in a plan, on which is coloured in blue the areas of the County Council district which are below high-water mark. (*The Plan was handed in.*) There are parts down at Plumstead, Woolwich, and at North Woolwich, then the whole of the Greenwich area and a good deal of the Isle of Dogs, the whole of the big marsh which formerly extended from Deptford right up to Battersea, and a small portion of the neighbourhood of Fulham. The boundary of the county is coloured in green at either end of the map. Of course, as I need not explain, the drainage of all those parts has to be carried on by pumping. That, of course, is confined entirely to the County of London; but there is a district which we are just called upon to drain—what we call the Island—that lies between the Albert and Victoria Docks and the river. That is also, the greater part of it, below Trinity high-water mark. I should say that the area that you see coloured on the map amounts to about 11 square miles. By an Act passed in 1879, called "The Thames River Prevention of Floods Act," the Council and its predecessors, the Metropolitan Board of Works, were constituted the authority to supervise and preserve the existing embankments, walls, wharves, and temporary works so as to prevent flooding. I will hand in a copy of that Act. (*A copy of the Act was handed in.*) This duty the Council carry out by means of constant inspection. They call upon owners of property to make good any deficiencies that may arise and issue licenses for the alteration or construction of any old or new works that may be required. These alterations weekly engage the attention of the Bridges Committee and the staff which works under it. The works principally consist of the old earthen embankments, wharves and buildings abutting on the river and movable tide boards to allow of access being made to barges, &c. These banks of the river in the county of London extend on the north from Hammersmith to Blackwall at the mouth of the Lea and the further frontage of north Woolwich, and on the south side from Barn Elms, a little above Putney, to a point near Crossness just below Woolwich. The total length of river banks within the county is about 40 miles. Then I deal with other embankments. The late Metropolitan Board of Works constructed, at a cost of over £2,000,000, and the Council maintain, the Victoria Embankment, extending from Westminster to Blackfriars Bridges on the north side of the Thames, and the Albert Embankment, extending from Westminster Bridge to near Vauxhall Bridge on the south side of the river. Then the next question I deal with is that of bridges. All the public bridges above Southwark to and including Hammersmith Bridge are under the control of the Council, and I am at the present time engaged in building a new bridge at Vauxhall at an estimated cost of £484,000; and designs are being prepared for a new bridge at Lambeth. Then dealing with sub-aqueous tunnels, between the years 1891 and 1897 I constructed for the Council a sub-aqueous tunnel under the river at Blackwall, the cost of which was, including approaches, about £1,500,000. This is a large tunnel to accommodate vehicular and pedestrian traffic. At the present time I am engaged in constructing another smaller tunnel for foot passengers under the Thames at Greenwich, the expenditure on which is estimated to amount to £160,000. In the last Session of Parliament an Act was passed authorising the construction by the Council of another large tunnel for vehicular and pedestrian traffic under the river between Rotherhithe and Shadwell. Of this work I am the engineer. The estimated cost is £2,300,000 for tunnel and approaches. Then I come to the steam ferry. The Council and its predecessors constructed and work the free steam ferry which crosses the river at Woolwich, the capital cost of which was £190,000, the cost of maintenance being £20,000 per annum. These various cross-river communications east of London Bridge have been undertaken mainly with the object of facilitating communication between the dense population

which surrounds the docks on the north and south sides of the river. The next point is with regard to protection from fire. The Council also maintains as a branch of its Fire Brigade Department by means of six tugs, eight rafts with engines aboard, four barges and one steam fire float, an efficient service for the protection from fire of the docks, wharves, and other river-side property.

3036. (*Mr. Ellis.*) Under the head of prevention of floods, you quote the Act of 1879. Does that Act contain all the powers that you have with regard to the prevention of floods?—I think so.

3037. And have you found them amply sufficient?—We have found them amply sufficient for carrying on that work up to the present time.

3038. Speaking as an engineer, you do not desire any further powers than you have under that Act?—We do not. I think it is perfectly efficient for the object that we have in view, which is to prevent those low-lying areas which are marked on that map from being flooded at extra high tides.

3039. Has there been any alteration of the channel of the Thames during your time, either by nature or art unfavourable to the prevention of floods?—I think not.

3040. Is it improving, or the contrary, or is it stationary?—During my experience, I should think it is pretty well stationary. We have had one very high tide. The high tides occur with the easterly breezes generally. We had a high tide four or five years ago, which gave us a little trouble at one place at Rotherhithe, but it was easily put right.

3041. But you would say that the natural and artificial state of things is stationary?—Yes.

3042. (*Sir Robert Giffen.*) What was the date of the last serious flood?—I forget now, but it was about five or six years ago. I will have the information sent in answer to your question.

3043. You do not apprehend any serious floods now?—No. The Council and its predecessors, representing, as they do, a population of over 4,500,000 persons, with a rateable value of about £37,500,000, extending over an area of 121 square miles, have expended large sums of money in improving the river and its cross communications; and the Council, and the large community which they represent, have a very material interest in the Port of London and in the river which flows from Hammersmith to Woolwich through the County of London.

3044. (*Mr. Ellis.*) Is that £37,500,000 rateable value quite recent?—Yes, it is quite recent—after the last quinquennial valuation.

3045. (*Lord Revelstoke.*) Now, what have you to say generally as to the river?—I am a native of London, and am well acquainted with the river from my earliest years; and I have, during the past 10 years devoted a great deal of attention to studying many of the complicated questions connected with it. London, probably, took its origin because of the facilities, defensive and otherwise, which its site, almost surrounded by marshes, on the banks of the Thames affords, and its growth and prosperity have, no doubt, been largely due to the natural facilities which the river and its estuary have always given. The great and pre-eminent advantage which the port of London possesses over many others in the Kingdom, Liverpool for example, is the non-existence of any well-marked bar at the mouth of the river. Consequently ships are able to enter and leave the port at all states of the tide. So great are the natural advantages of the river that little has been done, except some desultory dredging, to improve its condition since those almost prehistoric times when it was originally embanked. The tendency of modern commerce is in the direction of employing larger and larger vessels. The consideration therefore arises as to what should be the limit of draught which, in looking to the future, we may at the present day consider it reasonable to provide for. A large proportion of the steamships now built are constructed to permit of their passing through the Suez Canal, which is intended to accommodate ships requiring a depth of 30ft. of water. Consequently I consider that a not exaggerated estimate would be that the Port of London should be able to accommodate ships requiring a depth of 30ft. of water at low tide. The question next arises, how far up the river should such a channel be carried. There can be no doubt that it should be carried up to the entrance of

Sir A. K.  
Binnie.

11 Dec. 1900

Sir A. R.  
Binnie.

11 Dec. 1900.

the Albert Docks, and this is perfectly feasible; and when we look at the difficulties that have been overcome on the Clyde, on the Mersey, and other rivers, by much smaller communities, expense should not be allowed to stand in the way.

3046. (*Sir Robert Giffen.*) When you say that ships are able to enter and leave the Port at all states of the tide, is there not some detention down below Gravesend owing to banks there?—That is so. It was given in evidence before the Board of Trade Inquiry that there are certain shoals below Gravesend which do prevent ships coming up. I am alluding in what I say here to the fact that there is no permanent bar at the mouth of the Thames; it is only a question of making the estuary and the river deep enough.

3047. Is not that an over-estimate of the depth of water in the Suez Canal? You say 30ft.?—That is to be, I believe, the ultimate depth of water in the Suez Canal.

3048. But it is not the present depth?—No. I believe the present depth is 26ft. to 27ft.

3049. (*Sir John Wolfe-Barry.*) 8½ metres?—8½ metres is the present depth. Sir Edwin Dawes, one of the witnesses before the Board of Trade Inquiry, said: "I am a Director of the Suez Canal Company, and we are going to have a depth of 30ft."

3050. (*Mr. Ellis.*) What year was that?—That was before the Board of Trade Inquiry. It was the 20th December, 1894.

3051. (*Rear-Admiral Hext.*) Have you ever thought what the width of this channel of 30ft. should be up to the Albert Dock?—In the estimate which I am about to present you will see I have estimated it up to the Albert Dock at 600ft. wide, bottom width.

3052. Is it your opinion that that should be the width of the channel?—I think that would be an economical width of channel. It could be made wider if required, and, of course, narrower goes without saying.

3053. But that width would not provide for a long vessel anchoring and having to swing?—It would not.

3054. You would have to have lay-byes in that case?—Yes, you would have to have lay-byes if the ships were going to swing in the channel.

3055. (*Mr. Ellis.*) I gather that coming before us as the engineer for the London County Council, you wish to emphasise the importance to the Port and trade of London of a deepening of the channel, having regard to the increased draught of vessels?—I do.

3056. And you would say that if something of that kind be not done, and done speedily, the Port of London is relatively decreasing in its facilities?—I think that is the general impression produced on my mind.

3057. I want to get what is your impression?—That is certainly my impression. Having listened to all that was said at the Board of Trade Inquiry and read all that has been laid before you, that is my impression.

3058. You use an expression which is rather an alarming one, coming from a great engineer. You say that expense should not be allowed to stand in the way. Of course, in using that language, you have regard to the backs of the ratepayers of London?—I have, and when I come to the estimate I do not think the sum will be so alarming as some people think.

3059. (*Sir John Wolfe-Barry.*) When you say that the channel is perfectly feasible, have you studied the question by means of plans and surveys?—I have, and I propose to place them before you when I come to the question of estimates.

3060. Then you have quite satisfied yourself, I take it, that there is no difficulty on the part of the riparian owners' interests?—I do not think so; below the Albert Dock there is none whatever, I think.

3061. I am only dealing with the river below the Albert Dock at present, but it was indicated by some witnesses—I think by the Chairman of the Thames Conservancy—that some of the embankments were in a dangerous condition, and might be endangered by deeper dredging; and also that some of the wharfingers might object. Dealing first of all with the old earthen embankments below the Albert Dock, are you quite satisfied that there is very little in that?—I do not think there is any fear on that score, below the Albert Dock. I shall show you the sections presently, and you will be better able to judge.

3062. We will just take your general opinion first. And also with regard to private wharves?—There are no private wharves of importance.

3063. And those that there are you do not think will

be endangered?—I do not think in any way. Now I will deal with the channel above the Albert Docks. A further question then arises as to how much further up the river a deep water channel could be dredged. With the exception of the occasional arrival of a few large steamers, the only large ocean-going steamers which regularly pass up the river beyond the entrance of the Albert Docks are the vessels of the Donald Currie (Castle) Line, which sail to and from the East India Dock, just below Blackwall. Portions of the river banks in the neighbourhood of North Woolwich and between it and Blackwall are, in places, of a nature to require careful consideration before the maximum depth to which the river can be dredged has been ascertained. To form a channel 30ft. deep at low water would involve dredging; but, as remarked above, the difficulties which have to be considered in this part of the river arise more from the nature of the banks when taken into account with the depth of dredging, although my impression is that, after proper investigation, it will be found perfectly feasible to carry a 30ft. channel up to Blackwall. The great advantage which would be gained by deepening the river down to 30ft. at low water as far as Blackwall would be to allow ocean-going steamers to enter the Victoria Docks, and the East and West India Docks. The Blackwall Tunnel would form no obstruction as its top is situated 53ft. below Trinity high water mark, which, allowing for a 20ft. tide, would give a depth of 30ft. at low water and still retain a cover of 3ft. over the top of the tunnel. Passing up the river we next come to the Greenwich footway tunnel, the top of which is situated 53ft. below high water mark, so that a 30ft. channel could also be carried above this point if required, but it would probably, in the neighbourhood of Greenwich, require dredging to a depth of 10ft., which would still leave a cover of 3ft. over the top of the tunnel. I have little doubt, however, that a channel 30ft. deep at low water could be carried as far as the new entrance to the Surrey Commercial and Millwall Docks above the Royal Victualling Yard at Deptford. The next point to be considered is the amount of obstruction afforded by the proposed Rotherhithe tunnel. This tunnel will pass diagonally across the river from a point a little above the upper entrance of the Surrey Commercial Docks to a point a little below the Shadwell entrance to the London Docks. The top of the tunnel, as sanctioned by Parliament is 49ft. 9in. below Trinity high water mark. Allowing for a 20ft. tide and a cover of 1ft. 9in. over the top of the tunnel, a channel 28ft. deep at low water could be formed. As I believe that the depth of water at the Shadwell entrance of the London Docks is 28ft. below Trinity high water, such a channel, if made, would allow vessels requiring the full depth of 28ft. to pass up to the London Docks at all stages of the tide, but this, I think, would be the extreme limit, if on further investigation it should be found possible, when taking other reasons into account, to construct the same. A short distance above the proposed Rotherhithe tunnel and the entrances to the Surrey Commercial and London Docks, exists the Thames tunnel, now used by the East London Railway. I understand that the top of this tunnel is situated 47ft. below Trinity high water mark, but as it is composed of brick-work, and not of cast-iron, as are the tunnels above spoken of, it would require careful consideration to determine to what depth dredging could be carried on over it.

3064. Dealing with the channel above Albert Docks, I should like to ask you the same question relating to a possible 30ft. channel that I asked you with regard to the channel below the Albert Docks—whether you have studied the question of the cross sections of the river at what I may call critical points where important properties adjoin or matters of that kind, in order to satisfy yourself that what you say as a general statement is true in particular?—I cannot speak with the same confidence about a channel above the Albert Docks that I can speak with regard to the lower channel, because both myself and the engineer to the Thames Conservancy Board (we have taken this matter into consideration) think that some investigation is necessary before determining on the depth of dredging. But I have prepared a series of cross sections showing what might be done if the banks are considered sufficiently stable. These are cross sections of the river at various points showing in the first instance in red the channel 30ft. deep and 300ft. wide with slopes of 7 to 1, and showing in dotted lines what would be the result if the slopes were flattened out to a little above low water mark.

(*The Witness handed in Cross Sections of proposed dredging between the Albert Dock and the Greenland Entrance to the Surrey Commercial Docks, and between Albert Dock and Gravesend.*)

If it were carried to that depth and width it might require a channel with side slopes varying from 1 in 9 to 1 in 20.

3065. (*Lord Revelstoke.*) Are these the cross sections on which your estimates are based?—They are.

3066. (*Sir John Wolfe-Barry.*) Do these cross sections indicate the walls—are these vertical lines on the cross section wharf walls?—They are the banks of the river. Of course they are on a distorted scale. It is all set out on the chart. This is the lower channel, going downwards. Take for instance No. 4 opposite Greenwich Hospital. There the channel with a 7 to 1 slope would be quite clear of the banks altogether. If you flattened the slope off here it would be 1 to 9 and 1 in 10, and the question which would have to be investigated no doubt is as to whether the material which now forms the bed of the river would stand at slopes like that.

3067. For the benefit of the lay members of the Commission you may perhaps explain that these sections are greatly distorted?—They are on a greatly distorted scale of course.

3068. (*Mr. Ellis.*) That is to say, the vertical and perpendicular scales are not the same?—No. The perpendicular scale is magnified for the purpose of seeing more readily what the depth would be.

3069. (*Sir John Wolfe-Barry.*) I suppose you admit that the question of the properties adjoining would have to be studied very carefully?—Very carefully indeed.

3070. They might have to be protected?—They might.

3071. Would the cover that you have indicated as possibly 3ft. over the Blackwall Tunnel and 1ft. 9in. over the Rotherhithe Tunnel, be in your judgment sufficient?—I think so.

3072. Would there be no risk of injury to the tunnel by the grounding of ships and no risk of undue leakage?—I do not think there is any leakage. In the case of the Blackwall Tunnel you will recollect we drove the tunnel with only a cover of 5ft. I do not think the tunnel would suffer. Supposing a ship were to ground upon it, it might be harmful to the bottom of the ship I am afraid.

3073. Giving it all your careful judgment, and speaking as the responsible adviser of the London County Council, you, as an engineer, would not object to that depth?—I should not object to 3ft. certainly.

3074. With regard to the Thames tunnel that is another question?—That is a very difficult question, because I really do not know all the facts, and the tunnel being built of brickwork it might be serious in that case.

3075. You do not know, I suppose, what is the depth now below the bottom of the river of the brickwork of the Thames tunnel?—I do not.

3076. (*Rear-Admiral Hext.*) I suppose the only possible danger to these tunnels would be a ship sinking, or possibly an anchor might injure it?—I think the outside of the tunnel is so smooth that it would not be injured by an anchor. The only damage likely to accrue would be a ship at very low water grounding on the top of the tunnel.

3077. If you had 3ft. over the top of the tunnel no ship could possibly touch it unless she sank?—Exactly.

3078. Would you advocate a depth of water of 30ft. from the Albert Docks right up to the Surrey Commercial Docks?—I should like to see it, but I could not advocate it at present, until, as I told Sir John, there has been very careful investigation of the river to see whether it is possible. I believe it to be possible, but without careful investigation I should not like to say for certain.

3079. You think it would be worth doing if it were possible?—If it were possible, certainly it would be worth doing.

3080. And the extra expense between 26ft. and 30ft. would be repaid?—I think it would.

3081. (*Lord Revelstoke.*) Now you have prepared a rough estimate of the cost of this work?—I have.

3082. We should like you to go through it with us?—The estimate is based on the chart which I have just placed on the table, and a series of cross sections. Those which we were referring to are between the Albert Dock and the Greenland entrance of the Surrey Commercial Dock. The worst are these three upper sections just below the Albert Dock—Nos. 14, 15, and 16. No. 14 is clearly out in the middle of the river. No. 15 is a little to the one side of the channel, but it could easily be moved if it is found requisite to make it more symmetrical with the present width of the river.

3083. (*Sir John Wolfe-Barry.*) Perhaps I may interpose here just to ask you what curves you have taken for the middle line of your channel all the way down?—The curves are very large—half a mile radius.

3084. About half a mile radius?—Yes. The next point is obviously perfectly easy, because we have got steeper levels on the side than we are purposing to put on the channel itself. Then after you pass No. 16 it becomes obviously very easy to make such a channel, and the depths are gradually decreasing until we get down near to Gravesend, where they are comparatively straight, where we get the 600ft. width. You will notice also that I have placed upon the cross section "chalk probable" in different places.

I put in a plan showing a series of borings and wells and other things that have been sunk on the banks of the Thames or very near it. (*The witness handed in plan.*) This plan shows the positions, and these sections show the nature of the material that was found in the various borings. The principal thing to regard is, first of all, is it hard material in the shape of chalk, which would be a matter of expense? Those are mentioned on the sections where they occur. From Woolwich downwards there are one or two places where undoubtedly chalk would have to be dredged. The difficulty really, I think myself, does not exist in the chalk at all, but in the sands and clays of the Woolwich and Reading beds which immediately overlie the chalk. We met with them in the Blackwall Tunnel, for instance. Some of those sands when charged with water partake of the character of a quicksand, and that is where investigation would be required above the Albert Docks to see that we did not plunge into one of these quicksands and bring in the banks of the river. I do not think it is the banks of the river *qua* banks that would be injured, but the foundation might slip away owing to the dredging.

3085. (*Mr. Ellis.*) That is, if I may say so, the basis of your estimate?—That is the basis of my estimate. The basis of my estimate is the Conservancy chart which I have put in, which was the best information I could get. Of course, I had to do this, and it has been sent in at a later time because I was called upon by my committee to give them some idea of what such channels as those spoken of would cost.

3086. (*Lord Revelstoke.*) Then will you proceed with your estimate of the cost?—The first is:—Cost of forming a channel from Gravesend to the Albert Dock, having a depth of 30ft. at low water spring tides, a bottom width of 600ft., and side slopes of 7 to 1.

Net quantity of material to be dredged as derived from cross-sections 1,000 yards apart, say	8,800,000	cubic yards.
--	-----------	--------------

Add for possible inaccuracy (one-fourth)	2,825,000	"
Total excavation	11,625,000	"

Cost of dredging—	s. d.
Dredging	6 1/4 pr. cub. yd.

Average carriage	3 1/2	"	"
------------------	-------	---	---

Repair, maintenance, contingencies, &c.	2	"	"
---	---	---	---

Total cost	1	-	"	"
------------	---	---	---	---

11,625,000 cubic yards at 1s. per cubic yard	£.	£.
	581,250	

Contingencies, 10 per cent.	58,125
-----------------------------	--------

Total of estimate No. 1, Gravesend to Albert Dock	639,375
---	---------

That is the estimate to which I referred just now in speaking of the expense involved by other considerations. Then the second is what I might call the hypothetical channel above the Albert Dock:—Cost of forming a channel from the Albert Dock to the Greenland entrance of the Surrey Commercial Docks, having a depth of 30ft. at low water spring tides, a bottom width of 300ft., and side slopes of 7 to 1.

Net quantity of material to be dredged as derived from cross-sections 1,000 yards apart, say	8,800,000	cubic yards.
--	-----------	--------------

Add for possible inaccuracy (one-fourth)	2,200,000	"
Total excavation	11,000,000	"

I should say that were the slopes flattened out as in my reply to Sir John Wolfe-Barry's question just now I

Sir A. R.  
Binnie.

11 Dec. 1900.

Sir A. R. Binnie. explained, to these various slopes that are dotted here, it would add 50 per cent. to the total of that.

11 Dec. 1900.

Cost of dredging— s. d.  
Dredging - - - 8½ pr. cub. yd.

Average carriage - 4 " "

Repair, maintenance, contingencies, &c. - 2 " "

Total cost - 1 - 1 " "

11,000,000 cubic yards at 1s. 4d. £ 572,917  
Contingencies, 10 per cent. - 57,292

Total of estimate No. 2, Albert Dock to Greenland entrance, Surrey Commercial Docks - 630,209

If you total both the estimates it works out at £1,269,584, and there would be required for working that a plant which would probably cost a quarter of a million. That is a very hypothetical question, but I put it down at a quarter of a million.

3087. Is any of that plant in your possession now?—None whatever. We should have to get the most modern plant if it is to be worked economically.

3088. Therefore that would be a new expense?—That would be a new expense.

3089. Why is your carriage ½d. dearer in No. 2 than in No. 1?—We should have to take it a longer distance down.

3090. (Rear-Admiral Hext.) How many tons a cubic yard would you roughly calculate?—I think it varies from 1½ to 1½. It differs with the different material that you dredge out.

3091. 1½ to 1½ tons to a cubic yard?—Yes.

3092. When you say dredging, that does not include any of the cost of the plant?—It does not include any of the cost of the plant at all. I have got below, "Repair and maintenance," 2d.

3093. But do you not consider that 6½d. a cubic yard is rather a high rate?—I purposely put it high because I did not want in advising my Committee at Spring Gardens to under-estimate for a moment the expense of the work.

3094. It struck me as very high. This channel that you propose in the first estimate is only from Gravesend to the Albert Docks?—Only from Gravesend to the Albert Docks.

3095. You have not taken into consideration below Gravesend to the Nore?—No, because part of the recommendations of the Board of Trade Committee has been already carried out by the Thames Conservancy, and I have not the data to say how much more will be required to form a 30ft. channel.

3096. (Mr. Ellis.) The chart to which you have referred is some years old?—It is. It is corrected up to 1895-96, I think.

3097. You do not think that anything in the River Thames with regard to the channel has occurred since those years to vitiate the chart as a foundation for your calculation, that is not provided for by your allowance of one fourth?—I think not. I do not think any material change has taken place. The only thing that might be of advantage would be a chart on a somewhat larger scale. That is why I have put on to that 25 per cent. increase.

3098. Still you are quite ready to commit yourself to the 11,625,000?—I think so. I do not think there is any doubt about that.

3099. We quite understand that this is an approximate rough estimate?—It is.

3100. But within those limits you are prepared as the engineer of the London County Council—I will not say to stake your reputation, but to accept the responsibility for this estimate of £1,269,000?—Yes. I have always done so at Spring Gardens, and I have no hesitation in doing it here. The only thing with regard to the second estimate is that it must always be covered by what I have already said—that it should not be carried out until full investigation has shown it to be feasible and possible.

3102. And we may take it further as your opinion that the outlay of 1½ millions would be an advantageous outlay for the Port of London?—If possible. If it were possible to make it, I am sure it would be.

3103. The money would be well spent?—The money would be well spent.

3104. (Sir John Wolfe-Barry.) Your estimate does not touch the question of the shoals below Gravesend at all?—No, not at all. I tried to get the information, but I found I could get nothing reliable. Mr. More has told me that they have dredged part of it, if not the whole of it, to a depth of 26ft. However, I have got no plans showing what the channel is or where it is.

3105. Was not the question of what is to be done below Gravesend referred to at great length in the Board of Trade Committee's Report of 1894?—It was.

3106. I think I am right in saying that the general trend of that report was that whatever might be the case about the ability of the river to maintain a deep channel above the Leigh Middle Shoals, the question of a deep channel through the Leigh Middle Shoals was one requiring great attention?—That was the opinion expressed in that report.

3107. You will recollect, I daresay, enough of the enquiry to say that at that point the river widens out very suddenly as compared with the river above the Leigh Middle Shoals, and that there is a natural tendency for the deposit of material on those Leigh Middle Shoals?—Undoubtedly. The sudden opening out below Holehaven is very remarkable. Anyone acquainted with the river sees it as one goes up and down.

3108. The Board of Trade Committee at that time suggested the study of the question whether a training wall to narrow the river—to make it more gradually trumpet-mouthed—would not be at least as good a way of dealing with the question as embanking or dredging there?—They did.

3109. I do not know whether you have been able to make any study of that question?—I have not given any study to it, but if I were called upon to tackle the question that is one of the modes I should certainly adopt. Over those large flats, the Blythe Sands, and others, I should like to see tidal training walls carried out to direct the falling tide into the main channel.

3110. It would be, of course, comparatively useless to dredge a channel of 30ft. depth above Gravesend unless some means of dealing with the channel below Gravesend through the Leigh Middle Shoals were at the same time undertaken?—Of course.

3111. The limit—the natural depth—being 26ft. there?—26ft. at present.

3112. Therefore, whatever that would cost would have to be added naturally to the total estimate submitted by you when dealing with the subject of cost?—Undoubtedly.

3113. I suppose you would put the question of 30ft. depth of water up to the Albert Docks at a much higher value than the question of 30ft. up to the Surrey Commercial Dock—I mean as a matter of public necessity?—Yes, certainly.

3114. If merely the depth of water on the sills of the Surrey Commercial Dock was afforded in the channel, your estimate of £630,000 for the channel between the Albert Docks and the Surrey Commercial Docks would be largely decreased?—Very largely decreased.

3115. Therefore we need not necessarily consider the estimate as a whole, but it ought to be considered in parts?—It ought.

3116. Apart from the question of engineering difficulties?—Of course.

3117. Merely on the score of public utility the estimate ought to be taken in two parts?—In two parts, and I have so divided it, in fact, in the estimate.

3118. You would lay much greater stress on a depth of 30ft. up to the Albert Docks than you would to a depth of 30ft. up to the Surrey Commercial Docks?—Certainly.

3119. May I ask, have you considered the question of the ability of the river to maintain a channel of 30ft. if it is made?—I think there is very little doubt about that.

3120. Do you think there would necessarily or probably be any continuous dredging to maintain that depth if it were once afforded?—As in all tidal rivers you would always have to keep dredgers at work at different points.

3121. That I think you deal with later in your evidence?—Yes, I have dealt with that later on.

3122. I may take it generally that looking to the depth of water which is maintained at present in considerable lengths of the River Thames you would not anticipate that

there would be any difficulty from natural causes in the channel maintaining itself?—I think not. Of course, as at every other port you would have to do a little dredging every year at critical points, but as a whole, I think the channel would keep itself open.

3123. Does not the river, in fact, maintain a much greater depth in parts than 30ft. at present?—Yes, certainly.

3124. You allude to the difficulty of dredging chalk. I suppose with modern dredgers there is no difficulty in dredging chalk except as a matter of expense?—None whatever.

3125. Your cross-sections are plotted from the chart, and not from actual measurements since?—No—from the chart solely.

3126. I do not know whether you have considered this question. A great portion of the river bed is gravel, is it not?—A great portion.

3127. Any gravel dredged from the River Thames commands a ready sale, does it not?—A very ready sale.

3128. I do not mean to suggest for a moment that all the dredging or even a large portion of the dredging that you have estimated for would be gravel, but whatever gravel was found would more than pay its expenses?—It would.

3129. Is it not now sold at a profit by private dredgers?—Yes.

3130. (Lord Revelstoke.) Now, will you proceed with reference to the tidal action?—Apart from the question of depth of water for navigation, the deepening of the river would, by increasing the tidal capacity, tend to improve the scour in the estuary below. And it would be of great public advantage if, in the future, any public body charged with the welfare of the Port of London had its jurisdiction extended beyond the limits which at present bind the Thames Conservancy Board to such a distance seawards as would permit of full control over the tidal estuary below the Nore. I have here a small map showing the existing boundaries. (The map was handed in.) The Thames Conservancy limit is marked there. This is the limit of the dredging under the Act of 1894. A to B is the area over which the Board of Trade Inquiry of 1894 extended. Then the Port of London Tonnage Dues Boundary is shown on the same chart.

3131. (Rear-Admiral Hext.) What tonnage dues area is this?—It is under an Act—I forget the date of the Act—it is part of the London Lighterage and Tonnage area. The question of tidal action has, from the year 1855, engaged the careful attention of the Metropolitan Board of Works and the Council, and they have established automatic tide gauges at the following points—Hammersmith, Chelsea, and Blackfriars bridges, Deptford, North Woolwich, and Crossness, copies of the records of which can be furnished to the Commission should they require them. They are very voluminous; I have not brought them with me; they extend over many books, but if in the course of your inquiry you require those records they are at your service at any time. I carried out in 1890 a series of experiments between Shell Haven and the Nore to ascertain the velocity of the tide in the estuary of the Thames, as it would affect the discharge of sewage either at Shell Haven or on the Maplin Sands. These records will be found on pages 265-268 of the evidence taken on the Lower Thames Navigation Commission, 1894-1896. It would appear that considerable alterations must have taken place in the tidal flow of the Thames at London during the present century. It is a well-known fact that water was formerly pumped from the Thames at London Bridge and at Hungerford for the domestic supply of the Metropolis. Were the Thames as clean and clear as a mountain stream this would no longer be possible, because we know from our records that for months together the river above London Bridge contains so much sea water as to render it perceptibly brackish, and in dry weather this brackishness extends as far up as Kew. Among the contributing causes may be mentioned the removal of Old London and Blackfriars Bridges, the construction of the Thames Embankment, and the increased abstraction of water for domestic purposes above Teddington weir. I consider that any new body that may be constituted should have under its control all the tidal water above London Bridge, as there are many objectionable shoals in the river which could be moved with advantage to the general traffic. I have myself been aground when passing down the river in the Council's launch, "Beatrice," which draws 6½ft. to 7ft. of water, at points between

the Charing Cross Railway and Waterloo Bridges, and also immediately below London Bridge. The general dredging of the channel is a comparatively easy matter, but in the neighbourhood of the older bridges, such as London and Waterloo, care would have to be exercised. Teddington weir may be said to be the upward limit of the tidal action, beyond which it may be said to have no effect, except on a few occasions when the weir at high water has been drowned out and the locks forced open.

3132. (Lord Revelstoke.) Then it is your opinion that the river should be divided under two authorities, one tidal and the other non-tidal?—I think so.

3133. (Rear-Admiral Hext.) I presume in all these questions of dredging, if you had to superintend the work, you would supply yourself with the newest possible plant?—Undoubtedly.

3134. (Mr. Ellis.) Can you give us, as a matter of historical interest, the last time water was pumped at London Bridge for domestic purposes?—I can get that for you. I forget when it was.

3135. It is within the lifetime of persons now living?—I think so.

3136. With reference to what you said about tidal action, is there any lock this side of Teddington weir?—There is a half-tide lock at Richmond.

3137. When was that constructed?—About 1893 or 1894.

3138. By a private Bill?—By a private Bill for the purpose.

3139. In your opinion has that had any effect upon the tidal flow and scour up there?—I cannot very well say. My impression is that it has, but I should not like to give it in evidence that it has done so.

3140. You are probably aware that there is a controversy on the subject?—Of course there is a very strong controversy. I am in a state of suspended judgment. I believe it has, but I have no proof that it has.

3141. You do believe it has?—I do believe it has.

3142. That is the impression on your mind?—That is the impression on my mind.

3143. If that has had that effect, the construction of other locks this side would have a greater effect, I presume?—A very disastrous effect, I am sure.

3144. So far as it has had any effect it has been to the bad?—It has been to the bad as far as the river is concerned.

3145. I am speaking *qua* river?—I can quite understand the residents in the neighbourhood saying that it is an improvement. I regard it as a very important matter with regard to the whole Port of London that you should retain as much tidal capacity as possible, and if you take it off little by little at the upper end you decrease the up and down flow through London which is so necessary for keeping the river pure. I deal with that a little later on.

3146. So far as it has had any effect the construction of that half-tide lock has been detrimental to the river in the sense that we have been speaking of?—That is my opinion.

3147. (Sir John Wolfe-Barry.) And conversely, I suppose, you would say that the removal of obstructions in the Thames has very much improved the tidal flow?—Undoubtedly.

3148. So that as the water flows now at London Bridge the low water line is considerably deeper than it used to be, and the tidal wave comes in with greater rapidity than it did in former years?—Undoubtedly.

3149. Before the removal of Old London Bridge and the other obstructions to which you have alluded?—Yes. The Old London Bridge, judging by the sections that we have of it, must have formed a kind of sunk weir across the river; there was a large hole below the bridge, into which the water was continually falling.

3150. Nothing should be contemplated which would in any way obstruct the flow of the tidal wave in the Thames?—No; and everything should be done to increase it.

3151. (Mr. Ellis.) You want to preserve the natural scour?—The natural scour of the river itself.

3152. (Sir John Wolfe-Barry.) And history shows that it has very greatly improved within the memory of man?—It has.

3153. I only want to ask you one other question.

Sir A. R.  
Binnie.

11 Dec. 1900.

Sr A. R.  
Binnie.

11 Dec. 1900.

You indicated a wish that the new jurisdiction if it is constituted, should have its limits further below the Nore, seaward of the Nore?—Seaward of the Nore.

3154. Have you formed any view as to what distance below the Nore such a limit should go?—I think a better limit could not be suggested than the one at present for the Port of London dockage. It is a line from the Naze to the North Foreland. It is a very good line. It includes all the principal shoals at the mouth of the Thames.

3155. (Lord Revelstoke.) Will you proceed with your evidence?—I have not gone into the question of future dock accommodation, because it has been put so fully before the Commission from previous witnesses, but I will just say this. Looking to the future dock accommodation, should it be considered necessary, it is obvious that there are many possible sites on both banks of the river above Gravesend; and the nearer to London that any future docks are situated the better. Then, as to the flow of upland water. During the past ten years, as is well known, the Council have been investigating the subject of the water supply of London, and consequently I have had to inquire in great detail as to the flow of upland water into the tidal estuary. Teddington Weir is the point where hitherto the gauging of upland flow has been recorded, and an attempt has been made by the Council, assisted by the records of the flow of upland water at Teddington furnished by the Thames Conservancy, to ascertain what amount of water passes month by month into the tidal portion of the river. These deductions are based on the rainfall recorded at 24 stations established by the late Mr. G. J. Symons, F.R.S., to the maintenance of which the Council contributes. I present for the information of the Commission a Table showing the average results for each month for the past 17 years, 1883 to 1899 inclusive.

(The Witness handed in a Table showing for 17 years, 1883-1899 inclusive, the average natural flow of the Thames at Teddington Weir (including the quantity abstracted by the Water Companies), showing also the average rainfall and percentages of evaporation, flow from the ground, hours of sunshine, degrees of humidity, and temperature for the month. See Appendix, 9th day, No. 2.)

The annual average flow, it will be noticed, is 1,271½ million gallons a day, varying from 2,327·8 million gallons in February to 472·9 million gallons in August, and averaging for the three months, July, August and September, 499 million gallons, say 500 million gallons per diem. It will be noticed that these variations in flow are intimately connected with the evaporation which takes place, for we may say that, on the average, during the months of July, August and September, of all the rain that falls 88 per cent. is lost by evaporation, and only 12 per cent. flows from the ground. This is the natural flow of the river at Teddington Weir, and includes not only the actual flow, but the water previously abstracted higher up the river by the water companies at Molesey, Hampton and Sunbury. As during the months of June, July and August, 1899, the various water companies pumped from the Thames an average of 146·9, say 147 million gallons, we may say that out of an average natural flow of 500 million gallons as above had it been present during those months they would have abstracted 29·4 per cent., or nearly one-third of the total flow. The above figures deal only with average results of 17 years, but in many years the natural flow of the Thames at Teddington is much lower, as will be seen from another Table which I will hand in.

(The Witness handed in a Table showing the daily average natural flow of the Thames at Teddington Weir in certain periods during the years 1884-5-7, 1893-4-5-6-8-9. See Appendix, 9th day, No. 3.)

At the time of the sitting of Lord Llandaff's Commission the authorised abstraction of water from the Thames by the water companies was 185½ million gallons per day, but, as suggested by that Commission, this abstraction may be increased, if proper storage be provided, up to 300 million gallons a day, and still afford a minimum flow over Teddington Weir of 200 million gallons a day. It is as well to look at what the result would be. With a storage of 28,000 million gallons and abstraction of 300 million gallons, and a minimum flow of 200 million gallons at Teddington, the question arises for how long this minimum would continue. I worked this out for the Royal Commission for the years 1885, 1887, 1893 and 1896, and I present a Table which I laid before them,

showing that for those years the flow would be so reduced on an average for 149 days.

(The Witness handed in a Table showing the effect produced on the natural and actual flow of the Thames at Teddington Weir due to the average abstraction of 300 million gallons a day by the Staines scheme with reservoir capacity of 28,000 million gallons, and a supply to London given in the mean proportion of the years 1896 and 1897, the minimum flow of the Thames at Teddington Weir being 200 million gallons a day. See Appendix, 9th day, No. 4.)

If, however, we take the period from the 1st January, 1898, to the 31st October, 1899, with a reservoir capacity as large as 41,800 million gallons, and covering an area of 10 square miles, the actual flow of the Thames over Teddington Weir would be reduced to 200 million gallons a day for 350 days.

This, however, does not represent the whole evil of the case, because under their various Acts the Lambeth, the Southwark and Vauxhall, the Staines Reservoirs Joint Committee and the East London Company may draw collectively as much as 336 million gallons a day from the Thames when the minimum flow over Teddington Weir exceeds 200 million gallons a day. Consequently, not only is the general average reduced to 200 million gallons a day for long periods, but to fill the enormous reservoirs which are proposed, the smaller floods would be materially curtailed, and it will be noticed from Lord Llandaff's report, paragraph 103, page 41, that they recommend that, under certain circumstances, even the minimum flow of 200 million gallons a day may be further reduced; and some of the witnesses for the water companies before that Commission even went so far as to say that there would be no harm done if the total flow over Teddington Weir were entirely absorbed by the water companies. The effect of this continuous abstraction, if it be further permitted, may prove very detrimental, for the cutting-off of the flow of the upland water during the drier half of the year reduces that of the river between Woolwich and Teddington merely to the upward and downward passage of almost the same tidal water, and would tend to the shoaling up of the upper reaches and the diminution of the tidal capacity. What has occurred in Bow Creek, the estuary of the Lea, where practically all the flow of that river is in summer time absorbed by the water companies, is an instance of what may happen to the Thames within the County of London at no distant date.

3156-7. (Sir John Wolfe-Barry.) Was this evidence laid before Lord Llandaff's Commission?—It was.

3158. Then the question of the minimum flow over Teddington Weir, as possibly affecting the interests of the Port of London, was not lost sight of?—I do not think the Commission went very much into that. I laid before them the fact that decreasing the flow (this is not a disputed point at all) would have the effect of rendering the portion of the river in the County of London from Woolwich upwards simply a backward and forward movement of the same quantity of water in the months of summer; but I do not think the Commission went very much into the question of its effect on the tidal capacity of the river, or anything of that kind.

3159. I mean its effect on the channels?—I do not think they went very much into that.

3160. I take it that your evidence is very much directed to this, that a large abstraction of the upland water would damage the Thames?—Yes. What I am rather pointing to is this. I do not wish to open the vexed water question before this Commission, but if any trust or public body is empowered to manage the Port of London I think their jurisdiction should extend to Teddington Weir, so that they may keep a watch upon the flow of upland water.

3161. You put it to us that the tendency of the further abstraction of upland water might be detrimental to the interests of the channels of the Port of London?—Certainly.

3162. (Mr. Ellis.) As I understand you, you put it to us that you want two elements to preserve the natural scour of the River Thames for the benefit of the port—in the first place, no abstraction, which you have dealt with; and, in the second place, volume of water?—Yes, the largest volume of water you can get from the upland sources.

3163. Do you consider this a serious matter?—I do.

3164. And you would point to what has occurred at Recalled  
Bow Creek as a danger signal?—Yes. 7750.

Mr. GEORGE LAURENCE GOMME called and examined.

3165. (*Lord Revelstoke*.) You are Clerk of the London County Council, and you were appointed on the 30th October, 1900?—Yes.

3166. You were formerly statistical officer of the Council since 1891?—Yes.

3167. Will you proceed with your evidence. I see in your statement several historical quotations which you are good enough to give, the accuracy of which I suppose we may take for granted?—Quite so.

3168. (*Mr. Ellis*.) Of course we quite understand that you assure us that these are accurate quotations?—Yes, I do assure you of that. I have verified them in every case. I have prepared for the Rivers Committee of the Council returns to enable that Committee to report upon the following resolution of the Council (of the 24th March, 1896)—“That it being in the best interest of London to improve its shipping by improved and cheaper dock accommodation, it be referred to the Rivers Committee to report upon the whole subject.”

3169. Can you assure us that that date, the 24th March, is the right one. A good deal will turn upon the proceedings of the County Council, and we must have the dates perfectly accurate from the beginning. You understand my point?—I do.

3170. It will all come up in Parliament, and we must have it accurate?—I will send for the original minutes, and see that that is quite accurate.

3171. And the same applies to every date all through?—Yes; I understand that. The returns which were presented to the Rivers Committee I think the Commission have before them, but for the purposes of this Commission I have prepared evidence on behalf of the Council, which, as the central local authority of London, it is desirous of submitting as bearing upon the importance of the port and the docks as matters of public concern. I have studied this subject for some years as a matter of vast public importance, and have, at the request of the Council, visited foreign and English ports, in order to understand the question from as many points of view as possible. The first important point which the Council desires to direct attention to in connection with the Port of London is that formerly it was under municipal control. The manner in which municipal control has in the past been exercised in the port, and the various events which have occurred by which that municipal control has almost entirely disappeared, are of importance in the present inquiry. For this purpose the following facts have been obtained from original authorities. Early in municipal history the condition and administration of the port was always considered a municipal service, and many instances occur of works being undertaken by the municipalities of the country in connection with their ports. In London, from the earliest times the control of the River Thames seems to have been generally regarded as the duty of the mayor, commonalty, and citizens of the City of London. Thus in a case of disputed jurisdiction over the Thames in 14 Edward II. (1321), judgment was given (“*Liber Custumarum*,” Vol. ii, Part i., page 408) “*quod aqua Thamisis pertinet ad civitatem Londoniarum a Londoniis usque ad mare*” (that the water of the Thames belongs to the City of London, from London to the sea). Howel (“*Londinopolis*,” 1657, pages 15 and 16) refers to this judgment, giving a slightly different text; and to another similar judgment in 1 Richard II. (1377), when, the sheriffs and citizens of London being called in question for their jurisdiction exercised on the Thames, it was found “*quod nullus habeat aliquid juris in Thamisis usque ad novum gurgitem nisi cives Londonens*” (that nobody has any jurisdiction on the Thames down to the new “wear” [gurgles—a wear, “*Liber Albus*, Glossary,” page 389] except the citizens of London). A great amount of information as to the complaints and disputes is to be found in the series of records known as the “*Remembrancia*,” preserved among the archives of the City of London. An analytical index to these, for the period 1579–1664, was published by the City Corporation in 1878, and a few examples from this will illustrate the position. In 1580 we find, in a letter from the Lords of the Council to the Lord Mayor, the Government recognising the jurisdiction of the City over the Thames. The *précis* of the letter in “*Remembrancia*” runs, “The River Thames, by reason of the number of weirs between the bridge (London Bridge) and Windsor had become choked and almost unnavigable. They requested him, as conservator, of the river, to send the water bailiff or some officer to them with an account of the number of weirs existing from London Bridge to

Staines, how many there had been in ancient times, and what number had increased within the past seven years; how many were fit to remain, and to take order for the removal of the others” (pages 499 and 500.) Another letter of the same year, from the Lord Mayor to the Lord Treasurer, complained, “That, contrary to the rights and charters of the City appointing the Lord Mayor conservator of the River Thames within certain bounds, which jurisdiction had been quietly enjoyed by the City for many years without interruption, during which time the river had been kept in a good state, of late years the Right Hon. Lord Seymour, Lord Admiral of England, supposing the jurisdiction to belong to his office, had entered into the same and interrupted the franchise and authority of the City. Upon his decease his successors had, by their officers, continued the interruption. The Mayor and citizens, considering the great estate of the said Lords, had not pursued them right, as in law and justice they might and ought to have done. Since the time of the said interruption the river eastwards from London Bridge had become so decayed that ships or vessels which within 20 or 40 years past might have come up to the pool against St. Katharine’s, could not pass at low water without danger between London and Greenwich. The channel being choked, the lands adjoining were overflowed, to the danger of breaches, and the destruction of the fry and brood of fish, whereby the City lacked the good store of fish which used to be taken in the river. In consideration whereof, and because the City could not be kept out of utter decay and ruin without present amendment of the river, he requested his good offices and advice with Her Majesty and the Lord High Admiral that the City might be restored to their ancient rights. If any doubts existed as to the City’s right, the judges, after hearing evidence, should determine to whom the right belonged, that steps might be taken for the conservation of the river” (pages 500 and 501). In the same year another letter from the Lord Mayor to the Lord Treasurer stated that “Ships which formerly came to St. Katharine’s could not now come to Blackwall. Tilts and wherries were scarcely able to pass from London to Greenwich at low water. The princes and Parliament had in time past thought it best to commit the conservation of the river within certain bounds to the City. Fearing that in time to come the City might be charged with neglect, he requested that Her Majesty might be pleased to command her learned judges to declare the law in this case, and to whom the jurisdiction belonged” (pages 501 and 502). It will be noticed that in these two letters from the Lord Mayor to the Lord Treasurer, the Government is said to have granted the jurisdiction over the river “within certain bounds” to the City Corporation. If such definite control had been granted none of the authorities seem to mention it. Those letters from the Lord Mayor seem to bring out the fact that the City Corporation were considered as the conservators of the river, and claimed a considerable amount of jurisdiction in the river, but it was not until the Charter of James I. of 1605 that the position was made perfectly clear. That charter is dated 20th August, 1605, and a translation given in Birch’s “*Historical Charters*,” 1887, runs, in part, as follows (pages 132-138): “Whereas . . . the mayor and commonalty and Citizens of our City of London, time out of mind, have had, exercised, and ought, and have accustomed themselves to have and exercise the office of bailiff and conservation of the water of the Thames . . . from the bridge of the town of Staines . . . towards the east, unto London Bridge, and from thence to a certain place called Kendall, otherwise Yenland, otherwise Yenleet, towards the sea, and east, and in Medway, and in the Port of London aforesaid, and upon whatsoever bank, and upon every shore, and upon every wharf of the same water of Thames, within the limits and bounds aforesaid, and in, upon, and about all and every of them . . . we have granted, and . . . do grant to the said Mayor and Commonalty and citizens, and their successors, that they may exercise and execute the said office of bailiff for the conservation of the water of Thames. . . .” Whatever the authority under which the City Corporation exercised jurisdiction over the river prior to this stage there would seem to be no doubt, in the first place, that that jurisdiction was not definitely theirs by statutory right, and, in the second place, that it was recognised as belonging to them, not only popularly, but by legal opinion. The powers and duties of the Lord

Mayor as conservator of the Thames are concisely set out in Norton's Commentaries of the City of London (1829, pages 506 and 507). Mr. Norton was the Common Pleader of the City of London, an officer, and therefore I look upon him as a first-hand authority in giving this summary of the condition of things in 1829:—"The Lord Mayor has a general authority to remove weirs, kiddles, obstructions, and nuisances, and to seize unlawful nets and fish caught unlawfully or out of season. For the preservation of the waters of the fishery and of the navigation various Acts of Parliament have from time to time passed, and various ordinances of the Common Council regulating what nets are to be used and how, and condemning, under penalties and forfeiture, any injurious traffic on the river, over which offences the Lord Mayor has jurisdiction, either by action of debt in his Mayor's court or by inquisitions taken in his Court of Conservancy. A number of the members of the Court of Common Council form an annual committee called the Navigation Committee, to superintend the general state of the navigation. The Court of Conservancy is a most ancient court of record, held before the Lord Mayor eight times every year, in the four counties of Middlesex, Kent, Essex, and Surrey successively, by prescription and by virtue of the King's commission, which is granted by the King on his accession to the Lord Mayor for the time being. A jury is summoned of the residents of those counties, and their jurisdiction may be said to be confined to the injury and redress of common nuisances in the river. The commissions which have from time to time been issued from the period of Henry III.'s reign direct the Mayor to inquire into and authorise him to hear and determine offences in unlawful fishing. In modern times the court has been held with great regularity and with very beneficial results; the jurisdiction has been chiefly exercised, like the wardmote leet courts, for purposes of inquisition and presentment; and the redress of nuisances, when pointed out by such presentment, has been of late years sought by indictment in a superior court. For the purpose of enforcing his authority as conservator of the Thames, the Lord Mayor appoints an officer called the Water Bailiff, who is called the Sub-Conservator, and whose office over the river is of the same nature as that of the chief constable appointed by the county sheriff over the hundred. His duties, which are ministerial and partly regulated by statute, are generally to watch over the river for the detection of and to inform against nuisances; to summon the inquest jury and attend them on their view in fulfilment of the charge given them at the Conservancy Court; to attend the Corporation on their aquatic processions; to receive the instructions of the Navigation Committee of the Common Council; to license and inspect fishing nets; to seize forfeitures for the purpose of condemnation; and to obey the instructions of the civic authorities in removing obstructions in the navigation of the river." To what extent the Lord Mayor, having the above-mentioned powers and duties, was able or willing, through his deputy and Conservancy Courts, to cope with the growing traffic in the port, is shown in several contemporary annals. In 1746 Roger Griffiths, water bailiff (i.e., the Lord Mayor's deputy for conservancy purposes), wrote "An essay to prove that the jurisdiction and conservancy of the river of Thames, etc., is committed to the Lord Mayor, etc." I will give some quotations. The first quotation relates to dredging. "And so truly sensible has the City of London always been of the great importance of the navigation of this river that its chief magistrate and conservator thereof annually holds several courts of conservancy for its preservation, at a very considerable yearly expense to the city; and as a further proof thereof, it is not above four years since they laid out several hundred pounds in widening the channel, and taking away gravel from several shallow places of the river westwards, which at that time greatly obstructed its navigation, and this last without any other obligation on their parts than their zeal for the public good" (page 15). Then the second quotation deals with navigation. "But I am afraid even all this, or any other expense, how great soever, will little avail to the continuing and preserving this navigation open and free as it ought to be without a more uniform and regular method of navigating and loading the western great barges is more duly formed and established than what is practised at present or has been of late years especially" (pages 15-16). The third quotation relates to the mooring. "In order

to explain which, and to act consistent with the duty I owe to my office as well as the publick, I shall here just point out some few of those disadvantages which either now attend, or are but too frequently practised, to the detriment of the navigation westwards. And the first that I shall mention, and which is but too frequently committed by those persons who are entrusted with the navigating of these barges, especially down the river, is this, that such persons, whether through vitiousness, negligence, or wilfulness (best known to themselves), turn their vessels and run aground so across the channel of the river as to obstruct all other barges passing or repassing the same; and this, if I have not been misinformed, has been, and is often done, through envy, ill-will, or other clandestine views, to others coming down the river at the same time, and so interrupt each other's passage that not only the owners of the loading often sustain inconveniences by such delays, but the navigation is thereby much impaired by so many vessels lying in the way, or foul of each other, and thereby stopping or diverting the due course of the river, and turning its current, which naturally removes large quantities of sand and gravel from off the shallows into the channel, to its prejudice, both in respect to its dimensions, as well as depth of water; which, the more it is expanded, must naturally be the less deep, and consequently the more incapable of bearing the greater burthens" (pages 15-16). With regard to the lower river, a very vivid account of the state of the navigation is given by James Sharp in a report he made to the City Corporation in 1773, on a proposed canal from Waltham Abbey to Moorfields. He says (page 2): "Our port, once the noblest, perhaps, in the whole world, is greatly injured by many causes. Tideway navigations, according to the nature of things, choak up in time and become shallow, by the perpetual washing down of floods from the rivers above; and from the City of London such a quantity of soil and rubbish is continually carried into it by the sewers as is, of itself, prodigious, and such as can never be prevented; but, above all, such is the great contraction of the port, from Westminster to Limehouse, by embankments, by encroachments, and the ill-judged manner of forming our causeways from the stairs to low water mark that the Port of London is much upon the decline, and the inconveniences of it multiply very fast, insomuch that it is thought not less than £30,000 worth of cables are consumed in the winter months by the rapidity of the tides and land floods, there being no eddy waters for ships and other vessels to lie in; it is no uncommon thing to see whole tiers of ships forced from their moorings one upon another, and seldom a tide passes without accidents by vessels running foul of others in their passage both upwards and downwards, tearing and breaking away everything before them; and almost every winter for many years past has afforded melancholy scenes of vessels being wrecked and entirely lost even in our very port. Thus we stand with regard to our port, and our river navigation is in as bad a condition; neither can it ever be made much better, for locks and dams are impediments, which like the tideway will in time accumulate and render it broad and shallow by reducing the natural fall or descent into flat ground, so as to form a step, as it were, at every lock. Now, though I am averse to embankments in the tideway, sure I am that embankments and contraction is the only method that can be taken to preserve a stream navigation, but even this will not make a river good for passage upwards. The labour of passing against the stream can never be taken away, nor the meandering length shortened. A river stream is the natural drain of a country and ill formed for navigation." The Corporation had, under the Act 22, Charles II., cap. 11, constructed the channel of Bridewell Dock from the Thames to Holborn Bridge, paid for it out of the coal dues, and were authorised to charge reasonable rates for the use of the navigation and quays. In 1732 this channel had become "a grievous and dangerous nuisance" (6 George II., cap. 22), and the Corporation were authorised to fill up the channel and appropriate the ground in fee simple. It will thus be seen that though its ancient powers extended to dredging, construction of docks and quays, and nearly all administrative matters, the Corporation did not meet the requirements of the case.

3172. That is an argumentative sentence?—It is based on the previous quotations.

3173. Yes; but it is an argumentative sentence, and it must be taken for what it is worth?—Quite so. The

report of the Committee of West India Merchants, December, 1793, in reference to schemes for dock improvements at various outports, says (Appendix to Report of Port of London Committee, 1796, page 406, of *Reports of Committees, 1793-1802*): "The metropolis of Great Britain alone had, in these material respects, remained torpid; its improvements checked or suspended, and its abuses gradually gaining head." Other references to the inefficiency of the port at this time are to be found on pages 270 and 271 of the same volume. "A great and general complaint is made of inattention to a proper conservation of the depth of the river." "... The river has lost from 4 to 5 ft. depth of water at many of the stations or tiers of shipping and that shortly the channel of the river must be choked and rendered still less suitable to navigation, if measures of prevention are not adopted." "... The crowded state of the river, the want of room for mooring ships, and for the constant access to them by craft. ... No remedy seems to have been applied to this evil, though so repeatedly urged, and so fully admitted." "... The quays are not of sufficient extent, from which delays and many extraordinary expenses occur, and obstructions to the due collection of the revenue." Although Parliamentary power was obtained in 1696 to construct a wet dock at Rotherhithe, this dock was practically out of use until it was adopted for the Greenland trade. Practically in 1796 the Port of London had not a single wet dock, while Liverpool and Hull, obtaining statutory powers in 1709 and 1774 respectively "had improved navigation or constructed commodious docks, with warehouses and other commercial facilities." (Clifford, *Private Bill Legislation*, Vol II., page 630). In Hull the Corporation had assisted to form the dock company, and had subscribed thereto. In Glasgow, again, the municipality in 1758 had obtained an Act to improve the navigation of the Clyde, and had been conspicuous in their attempts to provide better facilities for shipping nearly a century before. So matters were drifting, the municipality of London letting go their hold upon this important service. In 1796 private enterprise began to be exerted. This is the first evidence of private enterprise. Early in that year a committee of merchants petitioned the House of Commons for permission to bring in a Bill for the making of wet docks at Wapping. Their proposal, as described by the Select Committee, appointed later in the same year "to enquire into the best mode of providing sufficient accommodation for the increased trade and shipping of the Port of London" was as follows (pages 276-277):—"To purchase 80 acres in Wapping. ... and there to excavate and form docks of 39 acres area of water, capable of containing 350 ships; and one other for the accommodation of lighters, of about two acres, with a course for the main docks into the river at Hermitage Dock."

3174. Is that an extract from the report of the Parliamentary Committee?—Yes, that is so—at pages 276 and 277. Two entrances were intended for shipping, one communicating directly with the Thames at Bell Dock, the other by a canal, navigable for ships of 350 tons, running eastward 2½ miles, reaching the river at Blackwall. Their petition was referred to a Committee upon whose report the House ordered: "That leave be given to bring in a Bill for making wet docks, basins, cuts and other works," with "a navigable canal from Blackwall to the said docks in Wapping." On 18th February, 1796, the Bill was read a first time. Thereupon numerous petitions were entered against it. Among them was a petition from the City Corporation, in which they claimed that, "ever careful of the rights and welfare of their fellow-citizens," they had "formed a plan for giving increased accommodation to vessels, without creating a new corporation or expensive establishments, and without imposing burdens on trade" (51 *Commons Journal* 431, quoted in Clifford's *Private Bill Legislation*, ii., 632). I point out there that the municipal action is again coming to the front, and in an extremely important manner. In the City plan it was proposed to excavate a dock of 102 acres in the isthmus of the Isle of Dogs capable of containing above 400 ships, and another at Rotherhithe of the same size. Further, they proposed to accommodate such trade remaining in the river by extending the frontage of the existing legal quays for lighters to lie alongside; to construct thereon spacious warehouses, and to open avenues to facilitate conveyance to every part of the Metropolis. So great was the outcry against the making of the docks according to the merchants' plan that the second reading of the Bill was postponed till the second Committee of 1796 had reported. To this Committee were referred,

in addition to all the petitions against the merchants' Bill, various plans for improving the accommodation in the Port of London, including among them those of the merchants and of the City Corporation. So important was the subject then considered that such 11 members as Mr. Pitt, Mr. Fox and Mr. Sheridan were appointed to serve upon the Committee.

3175. It was a very large Committee, if I remember?—My recollection is that it was about 15 members.

3176. Have you referred to the journals?—Yes, I have looked up all these facts.

3177. There were members for a number of counties upon that Committee. You may take it that this is so?—My recollection is that there were only about 15 members, but I am quite liable to be wrong about that matter. With regard to the merchants' plan for docks at Wapping, the Committee reported favourably, relying on the favourable reports of the Commissioners of Customs and Trinity House, to whom the plans had been referred. The Commissioners of Customs reported (*Reports of Committees, 1793-1802*, page 349): "We submit. ... that the situation pointed out for the wet docks and canal, for the purpose proposed, is, as far as we are capable of judging, preferable to any other of which we have had cognizance." Trinity House reported (*Reports of Committees, 1793-1802*, page 349):—"The Committee are therefore decidedly of opinion that the vacant space of ground in Wapping. ... under all circumstances is the most fit situation for wet docks and legal quays, for the accommodation of trade and security of revenue in the Port of London. The Committee beg leave to report farther that it is their opinion a cut from Blackwall to the dock at Wapping would also be of great benefit to the trade of this port, as it would free shipping and merchandise from all risk (so far as it extends) from the tides or shipping, which all parts of the river are liable to, and facilitate the passage into the dock." The Committee's report on the City's scheme (*Reports of Committees, 1793-1802*, page 277) was not favourable:—"The plan appears worthy of the magnificent and commercial spirit of the City Corporation, but meets with objection on the part of the Corporation of the Trinity House in their report, because it is deficient in providing for the fundamental convenience to trade by contiguity to the metropolis and ready intercourse of those concerned, and from the extent of lighterage endangering property and revenue. The danger to both, whilst valuable articles of high duty are detained in lighters, has already been observed by the report of the Commissioners of Customs: 'How far close or decked lighters are an adequate or desirable remedy has, from the evidence on safety and on port charges, been before observed upon by your Committee. The Brethren of the Trinity House further object to the encroachments on the Thames, by projection of the quays, as highly detrimental to the conservation and navigation of the river.'" The Committee did not, however, definitely recommend one plan, merely submitting their observations on the various schemes, with the evidence and appendix, "in order that the House may be better and more fully enabled to decide on the premises." Their report was dated May 13th, 1796, and the closing of the session on May 19th left no time for legislation. In the course of the next three years the merchants continued unsuccessfully their efforts to obtain authority to build docks at Wapping. The City Corporation modified their scheme. They had made a friendly arrangement with some West India merchants, and were promoting a joint Bill by which the City should have power to make a canal across the Isle of Dogs and improve the legal quays, while a West India Dock company, to be created, should make docks in the Isle of Dogs. There is the first instance of municipal and private action combined. In 1799 these two plans, together with a third of "merchants, traders, and wholesale dealers of the City of London and Borough of Southwark, and others interested in the trade and commerce of the river Thames and the improvement of the Port of London, for newly constructing London Bridge and for enabling ships of 500 tons to lie between that and Blackfriars Bridge," were referred to a Select Committee. The Committee reported (*Reports of Committees 1793-1802*, page 444):—"Your Committee are desirous of stating, in the first place, their unanimous opinion that it is indispensably necessary for the accommodation of the trade of the Port of London that some plan should be forthwith adopted for the improvement of the port. The great increase of the trade for some years; the prospect of a still further increase; the inconvenience, and even danger, to which ships are exposed in navigating the river, and the delay in loading and unloading their cargoes, from the crowded state of

Mr. G. L.

Mr. G. L.  
Gomme.

11 Dec. 1900.

the shipping; the advantages which several of the out-ports have obtained from the establishment of docks—cannot fail to impress on the House the truth of this opinion. Your Committee regret that though this subject has been now under consideration for several years, no measure should yet have been taken for remedying evils so universally felt and acknowledged by the commercial part of the metropolis; and they trust that a decision will take place, without further delay, in favour of some one of the plans that have been proposed." This passage interprets almost exactly the present state of things. I shall, in my evidence before this Commission, deal with the "great increase of trade," "the prospect of still further increase," "the inconvenience to shipping," "the delays at the port," "the advantages which several outports have obtained by the establishment of docks." With regard to the two plans for wet docks the Committee reported (page 445):—"Your Committee have no hesitation in delivering it as their opinion that it is desirable that docks should be established in both of these situations (Wapping and Isle of Dogs), and that they would be in no respect incompatible with each other. But considering how important it is that something should be done without further delay, your Committee have unanimously resolved . . . to recommend the immediate adoption of the plan of the Isle of Dogs." They preferred this plan "from the very great advantage of providing for large ships in a manner which would enable them to avoid the danger and delay of the circuitous passage." Following on this report the City Bill became law on 12th July, 1792. This is the first great Dock Bill. By this Act, the Common Council were empowered to make a navigable canal across the Isle of Dogs (Section 1); to build piers at Blackwall and Limehouse-hole, to facilitate the entrances into the canal (Section 2); to remove and alter the present mooring chains, and place others, under the inspection and approbation of Trinity House (Section 37). By Section 38, the West India Dock Company is incorporated, and ordered (by Section 42) to pay 5 per cent. as interest or dividends on moneys subscribed until the docks and works shall be completed, and afterwards interest or dividends, not exceeding 10 per cent. per annum. The whole of this Act is deserving of careful consideration as showing the position of the municipal authority at this date. It will be seen from these facts that the City Corporation, as the municipal authority of London at this date, took a prominent part in the construction of docks and improvements of the port. Although they allowed the West India merchants' scheme for docks to become part of their Act, and the company to be incorporated, yet many considerable powers connected with the administration of the port were conferred upon the Corporation, and even in connection with the docks themselves, it is noteworthy that by Section 48 of the Act, it was provided that, of 21 directors of the company, 4 should be Aldermen of the City, and 4 Common Councillors. That is a very important element in the case. Another feature of this Act is that the Government agreed to advance out of the consolidated fund on the credit of the rates and duties granted by the Act a sum of £72,000. Here, for the first time, the Government interested itself in the matter of docks. This grant led up to a series of later grants, which it is important to set forth. This information is obtained from the House of Commons Journal. On the 16th February, 1802, the City Corporation petitioned Parliament for a further sum of £50,000 to carry on the canal works, all the £72,000 originally advanced having been expended. The reason advanced for the inadequacy of the original grant was that in many cases it had been necessary to purchase the whole of properties of which only a part was required. By the subsequent sale of these superfluous parts it was hoped that it would be possible to repay much of the £50,000. The speedy grant of the money was important, as it would obviate much extra expense, the Isle of Dogs being at that time drained by two engines, one for the canal, and one for the docks in course of construction. The docks were to be opened in July, and the whole of the drainage (and the opening of the docks would probably increase it) would devolve on the canal—hence the necessity for expedition. The Act 42 Geo. III., cap. 49, was the outcome of this petition (7th May, 1802). On 7th February, 1803, the Corporation again petitioned Parliament for more money, suggesting that an additional toll should be laid on craft frequenting the port. No specific mention of the canal was made in the petition. It implies that the money was to be devoted to the general amelioration of the port, which would, of

course, include the canal works. The Act 43 Geo. III., cap. 124 (13th July, 1803), advancing £100,000 for repair of mooring chains and general improvement of the port, and making additional rates on vessels, was the result of this petition. On 1st March, 1805, the Corporation again petitioned the House for more money, saying that the canal works were in a very forward state, but more capital was needed. The result was 45 Geo. III., cap. 63 (27th June, 1805), advancing a further sum of £60,000. On 30th June, 1807, the Corporation again asked the House for more money, and 47 Geo. III., Sess. 2 cap. 31 (1st August, 1807), advancing £45,000 more, was the result. The total sum advanced by the Government under these several Acts was apparently £327,000, and it is important to note that a part of this was, under the 1803 Act, devoted to the repair of mooring chains, and the general improvement of the port. It was not devoted entirely to the improvement of the docks.

3178. (*Sir Robert Giffen.*) Was any part of that sum at any time repaid to the Government?—I am not able quite to state that. I know that the interest was not paid. At the time the East India Dock Company formed their dock they took in the canal that was made, and obtained the advantage of that, and were to have paid to the Government some portion of the cost, but whether they did so or not I am unable to say. Thus, at this date, the Government of the country, the municipal authority of the city, and private enterprise were conjointly concerned in a far-reaching scheme for the improvement and government of the port. After this important epoch in the history of dock administration of London, the active interest of the municipal authority gradually died out. So as not to use my own words, I have used Mr. Clifford's words in his well-known book, the "History of Private Bill Legislation" (ii., 653-4):—"In 1829, as the canal was no longer required for navigation, the Government and Corporation agreed to sell it to the West India Dock Company, whose works it adjoined. At that time none of the advances made by the Treasury had been repaid: the tonnage rates on which these loans were secured had been found insufficient to do more than meet interest and expenses. To end as quickly as possible a bad business, Parliament allowed the Treasury to sacrifice, after 1829, all claim for interest; the tonnage rates, for a term of twenty-one years, were devoted to repayment of principal; and the canal was handed over to the Dock Company, freed from all obligation to maintain it as a channel for vessels. Here, therefore, after thirty years, the Corporation closed their statutory connection with the dock and kindred enterprises of the century." In 1836 the attention of Parliament was again directed to the condition of the Port, and a Select Committee was appointed to enquire into the state of the Port of London.

3179. (*Mr. Ellis.*) Was that a Select Committee of the House of Commons?—A Select Committee of the House of Commons. Then it is reported at Page iii. of their Report:—"That it appears to this Committee that the navigation of the River Thames in the Port of London has for a great length of time been subjected to serious and increasing obstructions, by which the maritime approach to the metropolis has been impeded, the shipping exposed to injury and needless detention, and that frequent accidents have occurred, several of which were attended with the loss of human life. That this Committee are of opinion that the various conflicting jurisdictions and claims of the Admiralty, the Trinity House, and the Corporation of the City of London over the River Thames below the bridges have had a most injurious effect upon the interests of navigation, and that it is desirable that they should be consolidated and vested in some one responsible body, and that means should be found to provide for the removal of shoals and obstructions in the bed of the river." Here, again, the present condition of things is interpreted. I shall give evidence upon "the conflicting jurisdictions," and as to the insufficiency of the means "provided for the removal of shoals and obstructions in the bed of the river." The recommendation that the conflicting jurisdictions and claims over the river should be vested in one responsible authority was never carried out. Differences between the Crown and the Corporation as to rights of the Crown over the bed and shore of the Thames were being fought out. The Crown contended that it had a property in the bed and shores, and a right to revenue accruing from leases of land between high and low water. All this benefit had accrued to the City, which claimed property in right of conservancy. The Crown did not dispute the right of the City to conservancy, but held that title to bed and shores was independent thereof. Lengthy

See 5583.

and costly litigation followed. In 1846 a conference between the Crown and the City arranged that a Bill should be promoted to constitute a conservancy board, consisting of fifteen members, ten to be nominated by the Corporation and five by the Crown. The Bill was introduced in 1847, but did not pass owing to the lateness of the session. At a second conference, held in 1856 the City recognised the hitherto disputed rights of the Crown, and an agreement was come to by which two-thirds of the revenue from the bed and soil was to go to a conservancy board to be constituted and one-third to the Crown; litigation was to cease; all necessary conservancy funds were to come from dues levied upon the port and other sources of revenue of the Corporation; to the new board the Corporation was to appoint seven members, the Admiralty two, the Board of Trade one, and Trinity House two. That was the first constitution of the Conservancy Board, on which the City Corporation had the majority of members. The preamble to the Thames Conservancy Act, 1857, recites that "the lastage and ballastage and the office of lastage and ballastage of all vessels coming into, lying in or going out of the River Thames . . . and the supplying of ballast to all such vessels . . . have been by certain ancient grants . . . vested in the master, wardens, and assistants of the Corporation of Trinity House of Deptford Strand"; that Trinity House "have, from time to time, as occasion required, dug, raised, and taken up such gravel, sand, soil, out of and from the River Thames as were fit and proper for the ballasting of vessels"; that "there are in the River Thames certain shoals, shelves, and banks which materially impede the navigation of the said river, but the materials whereof, not being fit and proper for the ballasting of vessels, the same have not been dug, raised and taken up by the said Trinity House; that "it is expedient for the better and more safe navigation of vessels up and down the River Thames that such shoals, shelves, and banks as aforesaid, and others of the like nature, should be removed and taken away, and the said Trinity House "are willing to undertake the removal of such shoals, shelves and banks in manner hereinafter mentioned and provided for"; that "the public enjoy certain rights and privileges in and over the River Thames for the navigation and use thereof"; that "many encroachments have been made on the shores and banks of the River Thames, and it is desirable and expedient that further powers should be given for their removal and prevention"; that "in consequence of the great increase of steam navigation it has become necessary to provide safe and convenient places for embarking and disembarking steamboat passengers, and that the same should be put under proper restrictions and regulations"; that "it is expedient for these beneficial objects that the whole regulation of the River Thames should be under one uniform management and supervision of a permanent body of conservators, having all powers necessary for that purpose." The constitution of the Board under the Act gave a majority to the City Corporation, consisting as it did of the Lord Mayor, two aldermen and four common councilmen of the City, the deputy master of Trinity House, two nominees of the Lord High Admiral, one each of the Privy Council and Trinity House. This majority was destroyed in 1864, when six additional conservators (two elected by shipowners, one by owners of passenger steamers, two by owners of lighters and steam tugs, one by dockowners and wharfingers) were ordered to be elected. In 1866, 1893, and 1894, the constitution of the Board was again altered, but the majority of the City Corporation was never restored. At this point it is important to recall the condition of affairs in 1893. The London County Council had decided to ask Parliament to reform the constitution of the Thames Conservancy Board so as to bring it more into conformity with existing circumstances. The City Corporation no longer represented London, but only one square mile of London. The Council did not succeed in its efforts beyond obtaining a provision for temporary representation and the instruction of the House that the Conservancy should itself bring in a Bill to reform its constitution. This was done in 1894. The Bill, as introduced, proposed that the representation of the County Council and the Corporation should be 8 members out of a total of 33; the Bill was amended to give a representation of 12 out of 38, and the constitution of the Thames Conservancy was based upon the representation of the county authorities administering the area of the Thames basin. This legislation introduces into the government of the port a new authority, partly municipal, partly commercial, and partly administrative; but its powers are limited

and its finance is unsatisfactory. It is neither municipal nor private. In the meantime, in 1872, municipal administration in the Thames had again been introduced, thus interposing a new authority. Under the Public Health Act of that year the City Corporation became the sanitary authority for the Port of London, the expenses being defrayed out of the City estates.

3180. (*Lord Revelstoke.*) With regard to the next paragraph of the statement of your proposed evidence, we have considered it, and we do not feel inclined to take as part of your evidence anything which has to do with the powers granted to the dock companies. They will have an opportunity of telling us their powers themselves, and we do not think it comes within the scope of the evidence which you should give.—Of course I am in your hands. The point of view of the Council is that those are very important powers, and they have a municipal side as well as a private side.

3181. Still they are facts which do not directly concern you—the County Council?—Except in this way, that apart from the private interest they have to the dock companies they are of interest to the municipal authority of London, because they deal with such very large matters.

(*Mr. Ellis.*) I should like to say here this. We are now hearing very valuable evidence from the clerk of the County Council of London as to facts and narrative. As I understand we are going to have the advantage of hearing the evidence of one or two members, or perhaps the Chairman, of the County Council as to policy.

(*Witness.*) That is so.

(*Mr. Ellis.*) If that be so it probably will be more convenient to leave them to express their opinion as to policy and not to mix it up with the narrative of facts that we are getting from this witness.

(*Lord Revelstoke.*) I quite agree.

(*Witness.*) If I may say so the policy of the County Council will be submitted by members of the Council.

3182. Perhaps we shall have the pleasure of hearing the Chairman?—The Chairman of the Rivers Committee and other members of the Committee.

3183-4. (*Mr. Ellis.*) In support of that policy whoever comes before us will be able to bring in his views as to the dock companies at that time, but it would confuse your narrative to take it now?—I am quite in your hands.

(*Lord Revelstoke.*) We take it for granted that we shall have before us the Chairman of the Rivers Committee of the County Council or some representative in connection with questions of policy which they may wish to bring to our notice.

(*Mr. Ellis.*) As this is a mere recital of facts, and not an expression of opinion, I do not wish to ask any question upon it.

3185. (*Sir John Wolfe-Barry.*) I have one question to ask. Assuming that we see the Chairman of the Rivers Committee or some member of the County Council, will that gentleman come armed with authority to speak on behalf of the County Council after the Council have debated the question?—That is so.

3186. (*Lord Revelstoke.*) Now will you proceed to the question of dock accommodation?—I will in the first place hand in a Table showing the area of the docks of London from their inception to the present day.

(*The Witness handed in a Table, showing the Water Area (approximate) of the Docks of London in certain years from their inception to the present time. See Appendix, 9th Day, No. 5.*)

In 1802 there was created a dockage area of 62½ acres; by 1811 it had grown to 113½ acres; by 1821 it had grown to 178½ acres; by 1831 it had grown to 223½ acres. From 1831 to 1851 there was practically no development, but between 1851 and 1861 considerable development took place. By 1861 it had grown to 390½ acres; by 1871 it had grown to 471½ acres; by 1881 it had grown to 557½ acres; by 1891 it had grown to 629½ acres. Since 1886 there has been little or no development. Assuming that acreage roughly measures accommodation (and I think this would be so), there is a most significant deduction to be drawn from this table when considered with the expansion of the trade during the same period.

3187. Where have you got those figures from—the figures you have quoted as to the area?—They are compiled from the Admiralty Dock Book of 1900, Lloyd's Register of British and Foreign Shipping, and from miscellaneous sources. The value of the periodical increase in dockage can best be ascertained by comparison with the corresponding growth of shipping and the

*Mr. G. L. Gomme.*

11 Dec. 1900.

*Mr. G. L. Gomme.* character of the shipping. The following figures supply the principal data for this comparison:—

11 Dec. 1900.

Year.	Number of Ships entered.	Tonnage entered.	Acreage of docks.
1802 - -	14,577	2,085,351	62½
1831 - -	24,235	3,388,430	223½
1841 - -	29,367	4,347,580	225½
1851 - -	31,349	5,293,177	228½
1861 - -	28,175	6,299,211	390½
1871 - -	22,417	6,848,642	471½
1881 - -	*46,568	*10,001,626	557½
1891 - -	*45,555	*12,636,634	629½
1897 - -	*48,171	*15,187,261	631
1899 - -	23,711	14,682,971	631

\* Altered basis adopted in returns.

3188. (*Sir Robert Giffen.*) Of course, this is subject to the observation that the tonnage has not been ascertained in the same way all through?—That is so. I have inserted a note indicating that for the three years 1881, 1891, and 1897, it is on a different basis to other years. The difficulty all through these figures is that altered basis.

3189. (*Sir John Wolfe-Barry.*) Then is 1899 a different basis to 1897 again?—I am not quite sure as to that. I think 1899 is on the same basis as 1871. It is on a different basis to 1897, and I think it is on the same basis as 1871, but I am not certain.

3190. (*Mr. Ellis.*) If I may say so, you should not think about these figures; you should be quite sure?—Then I am unable to be sure.

3191. But you are a great statistician, and the representative of the County Council?—But I am unable to go behind the Government figures.

3192. That is the difficulty of taking the figures in this way?—No doubt.

3193. (*Sir John Wolfe-Barry.*) Could it not be ascertained at the Government offices from which these figures are produced?—I am afraid not. I have done my best to ascertain it, and I have not been able to get any better information than this.

(*Sir John Wolfe-Barry.*) The tables are really of very little good to us unless we know what they mean.

3194. (*Mr. Ellis.*) That applies to all these figures unless they come first hand?—Of course, I am only using the figures to show certain results, and I quite understand that some of those results may be called into question by reason of the figures upon which they are based not being absolutely what I suggest they are; but so far as I have been able to test the figures I think my conclusions are accurate even in spite of these differences.

3195. (*Lord Revelstoke.*) What do you suggest about the 1899 figures? Do you suggest that they are on the same basis as the 1871 figures?—I suggest that they are on the same basis as the 1871 figures.

3196. (*Sir John Wolfe-Barry.*) It makes a wonderful difference in studying these figures. If we compare 1871 with 1899 we see a small increase in the number of vessels entering and a very large increase in the tonnage, but if the figures for 1899 are on the same basis as 1897 we see a very largely decreasing number of ships—less than half?—But they are not on the same basis as 1897?

3197. They could not be, it is obvious?—They are not on the same basis as 1897, I am sure of that.

3198. Take the third column. We cannot tell whether the tonnage has increased from 6,840,000 to 14,682,000 or not. The figures really convey no impression to one's mind.

(*Mr. Ellis.*) It is not comparing like with like.

(*Witness.*) Upon that I suggest that the 1871 figures are on the same basis as the 1899 figures; but the intervening years 1881, 1891, and 1897 are on a different basis.

3199. (*Sir John Wolfe-Barry.*) Then you mean to lead us to the conclusion that the tonnage has considerably more than doubled?—Yes.

3200. And that the number of ships has increased by about 5 per cent.?—That is so.

3201. That you think we may safely take as a conclusion from your inquiries?—I do, and a little later on I think I can show how that is so.

(*Sir Robert Giffen.*) I think I may suggest that there is a partial explanation on these points in the Board of Trade figures which we have had.

3202. (*Lord Revelstoke.*) Now will you proceed with your evidence?—Between 1802 and 1831 the activity in supplying dock accommodation shows that the dock authorities were endeavouring (with success) to meet the requirements. It was nearly quadrupled during this period, whereas shipping had only increased by 62 per cent. in tonnage and 66 per cent. in number of ships. During the period of stagnation between 1831 and 1861 shipping had nearly doubled in tonnage (86 per cent.), the number of ships showing only an increase of 16 per cent. over the year 1831, and an actual decrease in numbers during the 10 years from 1851 to 1861. Dockage was then increased by 75 per cent., and again it seemed as if the dock authorities were determined to meet the requirements. Since 1861 the tonnage of shipping has gone on increasing in very considerable degrees, while the number of ships has proportionately decreased, showing unmistakably the tendency towards larger ships. The increase in the dockage has not been commensurate with the requirements during this period. Up to 1886 increase took place, the construction of the Millwall Docks and the Royal Albert Dock, additions to the West India Docks and the Surrey Commercial Docks, and the construction of the Tilbury Docks being the principal works. But shipping had again outstripped the dockage. It had grown from 6,299,211 in 1861 to 11,597,756 tonnage in 1886, an increase of 85 per cent. There I note the fact that we have the altered basis to contend with. Since 1886 it has grown from 11,597,756 to 15,187,261 in 1897—that is, over 30 per cent.; but nothing has been done during this period to increase the dock accommodation. In 1802, when the dock system was first instituted, the whole of the shipping was then accommodated in the river. It amounted to 14,577 ships, with a tonnage of 2,085,351.

3203. (*Mr. Ellis.*) You get those figures from the Committee's Report?—From the Committee's Report. That was considered so intolerable an impediment to navigation and so injurious to shipping as to induce Parliament to grant powers to private companies to construct docks. In 1899 the total shipping was 23,711 ships, with a tonnage of 14,682,971. The exact apportionment of this shipping between the docks and the river is not obtainable. It appears, however, from the particulars already handed in to the Commission by the chairman of the Board of Customs, that of the foreign trade alone there is accommodated in the river 5,670 vessels of a tonnage of 2,664,964, a considerably larger tonnage than the whole tonnage which entered the port in 1799. In addition to this the river has to accommodate the bulk of the coasting trade, which, on a basis that excludes a great number of vessels trading in the river, was, in 1899, 12,843 vessels and 5,438,378 tonnage. There is, at any rate, now accommodated in the river about four times as much tonnage as was held in 1802 to constitute a serious indictment against the authorities entrusted with the control of the port. I must qualify these conclusions by noting that the quays of the river has no doubt extended for the smaller vessels, but I am not able to state to what extent. The information can probably be obtained from the Thames Conservancy, who have to grant licences for wharves, and I would suggest that the information would be useful to the Commission. Still, with this information to hand, I do not think that the general conclusion as to the failure of the dock authorities to meet requirements can be invalidated. It may be, of course, that the dock system is not the proper system to extend for the new developments in shipping. But even so, there is no authority considering, or having the power to consider, what other system, if any, should take the place of dockage, or should supplement dockage, and until the docks are placed under a properly constituted authority no such consideration can be given to the vital questions proved by the figures I have given to be now requiring the most serious and immediate consideration.

3204. (*Lord Revelstoke.*) You say that the quays of the river has no doubt extended for the smaller vessels. Do you know that of your own knowledge?—Yes, I do know that. A great number of the wharves have been increased on both sides of the river of late years, and even down below the London area, but to what extent that accommodates the smaller vessels I have

no information. Even up above, in the Brent at Brentwood, and in the Wandle at Wandsworth, and in the Hammer-smith Creek, and places of that kind, there are a great number of inlets where comparatively small vessels go up at the present moment. To what extent that has taken away the vessels from the lower reaches of the river I am unable to say, because I do not know the extent of the wharfrage.
